Q Would you please tell me why you have converted this station to gas?

A We can more economically serve Keystone from our nearby generating facilities, so we are shutting down the station to utilize our more economical stations.

Q Are you, however, keeping a portion of that plant operable on gas?

A Yes. And that will be used to serve the steam requirement of Keystone.

Q Would you continue, then, with respect to your other facilities?

A We have the R. S. Wallace station in Peoria, [691] which has a 359 megawatt capability. There we have 10 boilers, 4 of which have been converted to gas. We are now converting 2 others to gas to comply with the air pol-

lution regulations. We cannot put electrostatic precipitators on these boilers economically.

The last four boilers will continue to burn coal. They do have electrostatic precipitators.

Our E. D. Edwards station, which is located just south of Bartonville, is approximately 400 megawatts in size. It is coal burning. We have precipitators on the boilers, and we currently are adding a 350 megawatt unit to the station, which will burn coal.

[692] Q As I understand it, your largest station at the time without regard to this addition, is your existing Edwards Plant which has a capacity of 400 megawatts?

A That is correct.

Q Have you in the past or in the recent past had another generating station or a generating station outside of the Peoria area?

A Yes. We had a power plant in Springfield, Illinois, a smaller plant, that generated electricity and also provided steam to the City of Springfield, as does our Liberty Street Station. We serve some 300 customers in Peoria, but we have since retired that Springfield station.

Q So that it is the fact that at the present time you are not burning any coal at all in Springfield, is that correct?

A That's correct.

Q Do you recall, oh, say in 1966 or in 1967 who was serving the Springfield Plant, which coal suppliers, if you recall?

A The Springfield Plant was served by Freeman.

Q From which mine?

A I believe it was the Crown Mine.

[693] Q Do you know what freight rate district that would be in?

A That would be in the Springfield Freight Rate District.

Q Other than the addition being constructed at the Edwards Plant, what plans have you for further additions to your generating capacity?

A We currently have under consideration a 400 megawatt unit to go into service in either 1975 or 1976 at a site that we have not determined as yet.

Q What fuel is this station likely to use?

A We would prefer the station to use coal. We would make an economic analysis of the oil, gas and other fuels before we made that determination absolutely.

Q Will air pollution considerations enter into your ultimate decisions as to the fuel in that station?

A Well, we would have to study the effect of the air pollution regulation at that time and consider the economics of the various fuels and the cost of providing control equipment and then determine just what fuel we wanted to use.

[694] Q Is there a possibility that this station or unit to which you have just referred or subsequent stations built by CILCO might use nuclear energy?

A We have studied the nuclear energy field, and to date we are installing units of such a size that it is not economical to install or think about installing a nuclear unit. For the most part, the size requirement is about 750 or 800 megawatts, especially in our area where coal is relatively cheap.

Q Approximately how many tons of coal per year does CILCO presently consume?

A During the year 1969 we consumed approximately 1,600,000 tons of coal.

Q Will you please tell me the manner in which CILCO purchases its coal?

A Well, for many years we have purchased coal on long-term contracts of five to twenty years.

Q What was your most recent request for bids from coal producers in terms of tonnages and lengths of time?

A For the unit that is going into service in 1972, we requested bids from the coal producers for twenty years at a million tons per year.

Q In other words, that was a request for 20 [695] million tons of coal?

A That's correct. We are actually buying reserves.

Q Why do you choose to purchase coal under such long-term contracts?

A Well, we are spending $50 million for a coal burning unit. This unit is a large portion of our total capability, and we would like to assure ourselves that we have the fuel for at least 20 years.

Q To what extent have you presently contracted for —may I rephrase that? To what extent have you presently bought all of your coal requirements for your existing stations?

A We currently have our coal requirement provided for, for our existing station and the units going into service in 1972, for a period of 20 years.

Q For a period of 20 years?

A Yes.

Q Do you purchase coal on the so-called spot market?

A Very rarely. The spot purchase of the coal has little interest to us. Our coal for the most part comes from the Peoria-Fulton County freight rate district. If we spot purchase coal it is usually out of that [696] district and we have to pay a higher transportation charge.

Q If the generating station or the addition planned for 1976, that is the generating station—if the generating station planned for 1976 ultimately utilizes coal, what would your expectations be with respect to the source of coal supply for that station?

A We would certainly hope to find the coal in the Peoria-Fulton County area. However, the reserves in that immediate area are diminishing. Other than that, we would hope to find coal just out of Springfield. Our preference would be the Peoria-Fulton County area, because of the transportation cost. For the most part, the coal has about a 30-mile haul to us. So staying right in that freight rate district is very beneficial to us.

[697] Q But you expect for this station to be supplied by one or more than one supplier?

A We would prefer one supplier so we could have the transportation economies. However, if the reserves were not available to one supplier, I suppose you could consider two. But one supplier is by far the best.

Q Can your coal fire generating plants consume coal produced anywhere in Illinois?

A No. I wouldn't go so far as to say you could use coal that was produced anywhere. We could fire coal that is produced within a certain chemical range, ash composition, fusion temperature and other characteristics, but

beyond that, if you don't have that chemical range, you get into trouble.

Q Are your boilers designed with a particular coal in mind?

A Our boilers are designed to utilize No. 5 and 6 seam coal out of the Peoria-Fulton County area.

Q Do you recall that CILCO received a questionnaire, a subpoena questionnaire, sent out by the court, do you?

A Yes.

Q If the characteristics of the coal burned [698] are so important, can you explain why in answering the subpoena questionnaire issued by the court an indication was given that there were no specifications as far as CILCO was concerned as to coal size, ash percentage, moisture content and so forth?

A We had been burning the Peoria-Fulton County coal for many, many years, so we are very familiar with the No. 5 and 6 seam characteristics. We do indicate, and perhaps it was an oversight on our part if we didn't indicate it, we do indicate the size and that the coal is washed. So all in all, when we purchase coal, we indicate this seam, the mine and the sizing of the coal and that it be washed.

Q In your judgment does coal compete with other forms of energy as a fuel source for the generation of electricity?

A Oh, yes. Coal is competing with gas and oil, and in our Peoria area we have four customers that are seeking to convert to gas their industrial power plant, which they produce both steam and electricity in. We have one customer that is interconnected with us, who operates in parallel with us, that has generation of 16,500 kilowatts. We don't expect them to continue to burn coal. This is the Corn Products Corporation in Pekin.

[699] Q The Pekin plant of Corn Products?

A Yes. We recently had the American Distilling Company in Pekin make a contract with us to purchase gas to convert their coal-burning facility to gas.

Q Which facility of American Distilling?

A That is also in Pekin.

In Peoria we have the Hiram Walker plant, which recently signed a contract with us for 5 million cubic feet of gas per day to start the conversion of their facilities.

Q From what fuel to what fuel?

A From coal to gas. We are interconnected with Hiram Walker, and all these companies. We serve a portion of their electric requirement already. The American Distilling and Corn Products plant. And then we have the Standard Brands plant that we furnish up to 50 percent of their electrical requirement. They are negotiating with us currently to convert their coal-burning facility to the gas.

So I would say the industrial use of coal in the very near future will be converted in our area to gas.

Q What about inter-fuel competition with [700] respect to electric utilities? Do you believe coal competes with other forms of energy?

A Yes. Very definitely. We have gas turbines. There is oil being used. There is nuclear fuel. There is gas. Just about all of the types of fuel are being used in competition with coal.

THE COURT: Would now be a good time to take a break?

MR. HEDLUND: Yes, your Honor.

May I inquire when we will be adjourning today?

THE COURT: 12:30.

MR. HEDLUND: I hope to make my examination short.

THE COURT: All right. Recess.

(There was a short recess after which the following further proceedings were had herein, to-wit:)

THE COURT: Are you ready to proceed?

MR. HEDLUND: Yes, sir.

THE COURT: You may.

BY MR. HEDLUND:

Q Mr. Davis, in your judgment, what is the future outlook for the utility market for coal?

A I would think the near term market for coal [701] would be excellent. There is quite a number of fossil fuel

plants going into service in the near future, so it would look to me that the production of coal would out of necessity increase in the near term.

Q What about the long term?

A I would think that the long term use of coal would be diminished. The air pollution regulations, I think, are going to play a very important part in the economics of using coal, and the disposal of ash, the disposal of sulphur, and that sort of thing.

However, the future for coal as a hydrocarbon through liquification or gasification, should be excellent.

Q How long have you known of the relationship between Freeman Coal Mining Corporation and the United Electric Coal Companies?

A I believe it was in 1960 that John Morris informed us that Freeman had a number of people on the board of directors of United and Frank Nugent was the Chairman of the Executive Committee. Since then, we have considered Freeman and United to be affiliated companies.

[702] Q Since 1960 up to the present time, could Freeman and United Electric, had they been independent, compete with each other for the coal business of CILCO?

A No. Prior to 1968 United provided all of our coal in the Peoria area. Freeman provided the coal for our Springfield plant. Since 1966, we have talked to United about their reserves in Peoria-Fulton County area. We had noticed that the reserves appeared to be diminishing, and at that time United mentioned the reserves of Freeman in the Springfield area. In 1968 we consummated a contract with United in which the reserves of Freeman were used to back up the term of the contract, possibly two years. The term of the contract was twenty years. They said that they thought that they had the coal reserves in the Peoria-Fulton County area for at least 18 years, possibly the full term. So Freeman was used to back up those reserves at the same cost per million BTU in the Peoria area.

So, if in the last two years coal has to be shipped from Springfield freight rate district, we will receive the coal in Peoria at the same current rate.

Q Up to, say, 1967 or prior to the present time were producers in the Springfield freight rate district [703] able to compete for the business of your Peoria area plants with producers in the Fulton-Peoria freight rate district?

A Historically we have used the Peoria-Fulton County freight rate district as a transportation base. All of our attempts to look at other areas for the most part included additional transportation costs.

Q I ask again were producers in the Springfield freight rate district able to compete for your business?

A No, sir, they were not.

Q What effect has there been, if any, on CILCO arising out of the common ownership and control of United Electric and Freeman, if you know?

A Well, considering our long-term contract with United, I would say the effect has been beneficial. We sought contracts from the coal producers in our area and the United contract was the only one that was forthcoming. We did have an approach by Humble to provide us coal but this was so scanty with information that when United offered us this contract, we accepted the contract.

Q Can you conceive of any potential benefit to CILCO that might follow from the divestiture of [704] General Dynamics' ownership of United Electric?

A Considering the location of our plants and the location of United Electric and the location of Freeman, I can't conceive of any possible benefit to CILCO from United and Freeman being required to divest.

[705] Q Has Central Illinois Light Company been engaged in merger discussions with other utilities?

A Yes, we have been. We have been engaged in merger discussions with the Commonwealth Edison Company and the Illinois Power Company. These discussions were terminated because the offers in the opinion of CILCO and our consultants did not adequately compensate our shareholders.

Q During those negotiations did either Commonwealth Edison or Illinois Power make reference to any

fuel cost advantage that might follow should the merger negotiations have been successfully concluded?

A Yes. In particular the Edison company talked about the future of nuclear energy. The Illinois Power Company, having lower fuel costs in Southern Illinois, thought perhaps they would have an advantage.

MR. HEDLUND: That is all I have. You may inquire.

THE COURT: You may cross examine.

CROSS EXAMINATION

BY MR. SIMS:

Q Mr. Davis, when was your Edwards Plant constructed?

A Our Edwards Plant was first constructed in [706] 1960. The initial unit went into service in 1960.

Q What was the installed generating capacity of that unit?

A 125 megawatts.

Q How many boilers were associated with this particular unit?

A One boiler.

Q What fuel has that boiler consumed?

A Coal.

Q Would you consider switching that boiler to gas or oil?

A Well, under present conditions we would not consider it. However, the future air pollution control regulations might force us to consider it.

Q If it was a matter of a price, the lowest price fuel, would you consider switching to gas?

A No, sir.

Q You distribute, CILCO distributes, gas, is that not true?

A Yes.

Q What is your lowest firm rate price for gas?

A Well, we have an interruptible rate of 36 cents per million BTU's.

Q That is an interruptible rate?

[707] A Yes, sir.

Q What is your lowest firm rate price for gas?

A Our lowest firm rate is about 45 cents. I had better go back and explain this. I am giving you the average costs to our customers for the year 1969. Now, the rate to an individual customer could be higher or lower than that, depending on their usage.

Q What is your average cost per BTU for coal at the present time?

A We purchase coal currently approximately 27 cents per million BTU's.

Q When was the next unit constructed at your Edwards Station?

A The next unit at the Edwards Station went into service in 1968.

Q You stated on direct, I think, that this unit consumed coal?

A Yes, sir.

Q Would you consider switching this unit to gas or oil?

A Just under the same basis that I stated previously.

* * * *

[712] Q And you burn gas at the interruptible rate?

A That is correct.

Q At this unit?

A That is correct.

Q Is it necessary for you to burn this unit when interruptible gas is not available?

A When interruptible gas is not available, for the most part we attempt not to run it or we burn coal on it.

Q Coal being more economical than the firm rate gas?

A That doesn't have any particular bearing on it. We are trying to fight the air pollution problem. We have mechanical-type precipitators. Due to the public pressure we attempt to burn gas.

Q So when you burn gas in this unit, you are not choosing a fuel from an economical standpoint. You are choosing a fuel, as you say, because of air pollution concerns.

A That's correct.

Q When did you construct the next unit at the Wallace Station?

A The next unit went into service in the latter part of the 1930's.

[713] Q How many boilers are associated with this unit?

A That is one boiler and one turbine on a common header again.

Q What is the installed capacity of this unit?

A That unit, I believe, is a 35 megawatt unit.

Q What fuels have you used initially?

A We used the same fuels on this boiler as we did on the previous boiler—coal initially, and then, when we got into the air pollution considerations, we switched to gas as an auxilliary fuel.

Q When was the next unit constructed at the Wallace Station?

A The next unit went into service in 1948.

Q How many boilers are associated with this unit?

A There were two boilers associated with that unit. That particular turbine had a 45 megawatt capacity with two boilers.

Q What was the fuel history of this boiler?

A We have burned coal on that particular unit, those two boilers, since they went into commercial operation. On this particular unit, we have electrostatic precipitators, so we don't have quite the air pollution problem we had on the previous boiler.

Q Even installing electrostatic precipitators [714] did not make the use of gas more economical than burning coal? Let me rephrase it.

You do not have to put an electrostatic precipitator on a unit burning gas, is that correct?

A That is correct.

Q The fact that you had to install electrostatic precipitators on this unit did not make the gas more economical than coal, did it?

A That's correct.

Q When was the next unit in at the Wallace Station constructed?

A The next unit went into service approximately 1952.

Q What was the installed capacity of this unit?

A This unit was a 72 megawatt unit with one boiler.

* * * *

[718] Q Mr. Davis, I would like to read to you a paragraph or two from your 1969 Annual Report as a preliminary question.

THE COURT: Is there an exhibit number, Mr. Sims?

MR. SIMS: No, sir, there is not.

THE COURT: All right. Do you intend to have it identified, in that you are reading from it?

MR. SIMS: No, I was simply going to read it and ask him if that was, in fact, true.

THE COURT: All right.

BY MR. SIMS:

Q (Reading) "Mounting evidence indicates that the natural gas industry is not finding sufficient new reserves to keep pace with the rapidly increasing demands. Many pipeline companies are now finding it difficult, if not impossible, to develop new gas supply expansion programs. Though the exact cost of this dilemma is not readily ascertainable, there is increasing contention by some authorities in industry and government that wellhead prices in recent years have been too low and, consequently, have resulted in the present unsatisfactory level of exploration, [719] development and production."

Is it not true, Mr. Davis, that because of this concern about the supply of natural gas that CILCO is expanding its underground storage facilities at the present time?

A Yes, we are expanding our underground storage facilities.

Q Is it not also true, Mr. Davis, that you are having trouble simply supplying the firm rate customers with natural gas?

A No, sir. We had more than sufficient gas supplies during this past year to serve our firm rate customers. We are expanding our gas storage field to assure ourselves next year that we will have the same capability. At the same time we have a requisition or a request in the Panhandle to further assure this.

Q Mr. Davis, do you expect gas prices, either inter-

ruptible or firm, to approach the price of coal in the near future?

A To approach the price of coal? No, I wouldn't think that.

Q What price per million BTU do you pay for oil?

A We purchase oil as an ignition fuel. It's [720] a refined oil and we pay about approximately 70 cents per million BTU.

Q Is it not true, Mr. Davis, that the price of coal has been significantly lower than gas or oil for the last ten years at least?

A Oh, yes.

Q You made studies, or CILCO made studies, did they not, concerning CILCO's average cost in connection with a proposed merger with Commonwealth Edison?

A I don't understand your question. The average cost of fuel?

Q Yes, at the CILCO system.

A We have kept track of the fuel cost trends of the electric utilities in Illinois for a number of years.

Q But, did you not make a specific study of the fuel cost of CILCO in connection with the Commonwealth Edison's proposal to merge?

A Oh, yes. We looked at our fuel cost.

* * * *

[724] BY MR. SIMS:

Q How much coal did you consume in 1964?

A We consumed just a little over a million tons.

Q How much did you consume in 1969?

A A million six hundred thousand tons.

Q Mr. Davis, do you think the State of Illinois will ever pass a law that in effect prohibited the burning of a substantial portion of Illinois coal, not only in the heavily populated areas, but in all sections of Illinois?

MR. HEDLUND: Your Honor, I am going to object. I think this is pure conjecture, and I do not believe Mr. Davis is a member of the state legislature. I will object on that basis.

MR. SIMS: Mr. Hedlund was asking him to predict what coal he would use in the future, and—

THE COURT: Well, we do not know what legislation will be passed. It is totally a matter of conjecture. Objection sustained.

BY MR. SIMS:

Q Mr. Davis, I think you stated on direct that the only other company interested in supplying CILCO at the time you were negotiating to supply your No. 3 unit besides UEC was Humble Oil Company, is this [725] correct?

A That's right.

Q Do you know approximately where the Humble coal reserves were located?

A Well, as I understand, the Humble coal reserves are located in the vicinity of Carlinsville, Illinois.

Q Do you know what county that is?

A No, I do not. It's right below Springfield, possibly —well, I don't know.

Q But, it is, as you say, somewhere below Springfield?

A Yes, sir—

Q The Freeman—excuse me.

A I am sure the vicinity of the coal around Carolinsville.

Q The Freeman Crown Mine is located in this general vicinity, is it not?

A That's correct.

Q Did Humble Oil indicate to you that they would supply you coal at a price competitive with Fulton County coal at the time you were negotiating for this No. 3 unit?

A Yes, they did.

[726] Q Now, I think you testified that in the future you expected probably to look to either Springfield or Southern Illinois for your future coal supplies?

A I don't believe I said that. I said that we would attempt to get the coal from the Peoria-Fulton County area or below Springfield.

Q If you go into the Springfield area to obtain coal, you will probably be dealing with either Freeman or Humble as a supplier in that area, is this not true?

A I presume.

Q Is it not true that when you were negotiating to supply your No. 3 unit at Edwards, you expressed an interest to the UEC officials in the Industry Field?

A No, that's not true.

Q You are familiar with the Industry Field of UEC, are you not?

A Yes, I am.

Q The Industry Field was not brought up in these discussions with UEC?

A We have never been approached by United Electric to furnish us coal from the Industry Field.

Q That was not my question.

Did you ever mention the Industry Field, in connection with supplying the No. 3 unit, to UEC officials?

[727] A At various times Industry Field was brought up in conversations, but no serious negotiation for the coal in the so-called Industry Field has ever taken place.

Q Assuming, Mr. Davis, that Industry Field is mined in the near future, is it not possible that UEC and Freeman would be competing for your coal requirements if they were operated as independent companies?

A If I care to make that assumption. I'm not real sure I can basically make the assumption.

Q I have asked you to make the assumption.

A Beg pardon?

Q I have asked you to make the assumption.

A I would have to assume, then, as long as we are assuming, from what I know of the Industry Field that the coal, from the various conversations that I have had, is not economically strippable. Now, if that's the case, then you would have to make the assumption that it's not economically available to you.

Q I asked you, though, assuming Industry Field was mined in the future—

A Yes.

Q (Continuing)—and this coal was offered to CILCO, is it not possible that UEC and Freeman would be [728] competing for the coal requirements of CILCO if they were operated as independent companies.

A Mr. Sims, it's awful hard for me to make that assumption all the way through.

Q Humble did offer to supply you coal in connection with this No. 3 unit, did they not?

A That's correct.

Q Humble reserves are very close to the Freeman reserves in Central Illinois, are they not?

A They're in Central Illinois, that's correct.

Q So, it is possible that Freeman will be supplying you coal in the future, is this not true?

A The term of our contract is for 20 years. It's possible for the latter two years that they would be furnishing us coal from the Freeman reserves.

Q You are planning to construct another coal unit in 1976, are you not?

A We are planning to construct another unit. We will have to study the fuel supply situation and make a determination after those studies. I can't say today is it going to be coal.

Q You have not committed yourself to purchasing any coal for this 1976 unit, have you?

A We have not made any commitment.

[729] Q So, are you in any position to say that if UEC and Freeman were merged, that they would have no effect on CILCO in the future?

A Well, we have studied the United Electric reserves, Mr. Sims, and we just can't see where United Electric has the reserves to be a factor in the coal business as far as we're concerned.

Q If their Industry Field was mined, however, they would be a factor in Fulton-Peoria area, would they not?

MR. HEDLUND: I am going to object, your Honor, at this point to further interrogation with respect to the Industry Field, unless Mr. Sims put all of the assumptions into such a hypothetical that are necessary for the witness to be able to answer the question. I believe he has been asked this question two or three times and the witness has said either that he did not know about all of the facts or it would depend, and so on. I am going to object to further questioning on this.

THE COURT: Do you have any comment, Mr. Sims? Hasn't this question been asked and answered?

MR. SIMS: Yes, I think so.

THE COURT: All right. The objection is sustained.

[730] BY MR. SIMS:

Q Is it your opinion, Mr. Davis, that UEC cannot sell its present coal profitably without Freeman back-up reserves?

A Well, in our own case we would not have purchased coal from United for a term less than 20 years. We were looking for a million tons of coal per year for a term of 20 years, and if they did not have this coal, there would have been no contract, I feel sure of that. I negotiated with United for a long period of time. We were after this coal for about a year, talked to Truax-Traer, Peabody, Humble, United, and we were looking for this coal for about a year trying to get a million tons a year.

So, I feel certain, had not somebody come up with the coal and the reserves that we wanted, we would have tried to put something else together. Now, what that would have been, I don't know, but it would have put them in a rather precarious situation as far as we were concerned.

Q My question was, Mr. Davis, do you have any doubt that UEC would be able to profitably sell its coal reserves?

A Yes, I have serious doubts. As a matter of [731] fact, we have a contract, or did have a contract running through 1974 with United, in which reserves of Cuba were sold to us, but due to the lack of discovery, let's say, the reserves weren't there, so we had serious doubts about United's ability to produce coal to us.

Q Did you revoke this particular contract with UEC?

A It is being revoked from the Cuba Mine simply because the coal reserves at Cuba are running out this year, while we had a contract going through 1974. This was the additional pressure, so to speak, to give us a good contract with good reserves from United. So, United's reserve situation, I think, is very lean to say the least.

Q Do you know for a fact, Mr. Davis, that the Cuba reserves are running out this year?

A From the best information I can get from their drillings and what they tell us, they have not found the reserves in that area that they expected to find. Otherwise, they've run into faults where the glaciers have come down and pushed the coal out or ground it up, so consequently they simply just don't have the coal. This is one of the things that you [732] run into sometimes.

Q Before you entered into the present contract with UEC, the original contract with UEC was to expire when, 1974?

A As I recall it.

Q Is your statement now that CILCO would have revoked this contract had they not entered into another contract with UEC?

A I don't know that we would have had any other choice. We have to have coal, so we got to working with United and Freeman to provide us the coal from another source.

Q UEC indicated then that they would not commit any coal other than the Cuba coal reserves?

A Oh, no. They're committing the Buckheart reserves to us now.

Q This is under the present contract, right?

A No, sir, this is under the future contract?

Q Excuse me.

This is the one that starts in 1978.

A It starts when the Buckheart reserves run out, unless assume they run out this year, then the future contract would start at the Buckheart arrangement.

Q It is a fact, though, is it not, Mr. Davis, [733] that there was very little enthusiasm among the coal companies to supply your No. 3 unit on this 20-year contract?

A Well, it's a fact that Peabody, for instance, had just built a new mine at Alma, and they were not getting the production out of the tipple that they had expected because they were running into technical difficulties, washing the coal and that sort of thing. We have a long-term contract with Pitt-Midway, and they are running about full production. Truax-Traer, we just consummated a contract with them two years prior. So, we

had just about used up the tipple capacity or the production capacity then available from that field.

[734] Q Consolidated Coal would not even talk to you concerning this particular arrangement, is that true?

A If you're speaking of Truax-Traer, yes. Well, they talked to us.

Q Pittsburgh Midway and Republic told you they had insufficient reserves?

A That's correct, in that area.

THE COURT: Excuse me, Mr. Sims. How much longer will your cross examination be?

MR. SIMS: Probably 20 minutes.

MR. CUSACK: Your Honor, may I confer with my co-counsel for a moment?

THE COURT: Yes, you certainly may.

(There was a short interruption, after which the following further proceedings were had herein, to-wit:)

MR. CUSACK: Thank you, your Honor.

MR. SIMS: It will probably be 25, 30 minutes.

THE COURT: Well, I regret that the only thing we can do is to proceed until 12:30 and we will have to recess. Will this witness be available Monday morning?

MR. HEDLUND: Is there any possibility, your Honor, of trying to get another half hour in this afternoon?

[735] THE COURT: I cannot. I just cannot work it in. We started at 9:00 this morning.

MR. HEDLUND: I know. I will have to consult with Mr. Davis.

THE COURT: Will you confer among the parties here and try to work it out. Let me inquire at this time as to how much longer the defense is going to take.

Is it Tuesday that I have the three-judge court?

THE CLERK: Yes, your Honor, 2:00 o'clock.

THE COURT: We will go from 2:00 to 3:00 on that, and we will start the trial at 3:00 on Tuesday afternoon.

MR. HEDLUND: Your Honor, I will have to take a look at our trial list. I am concerned that I think at this

point we are about two days late in terms of our original schedule.

(There was a short interruption, after which the following further proceedings were had herein, to-wit:)

MR. HEDLUND: For example, our original schedule was to have completed this week all of the witnesses that have been on the stand plus four that we did not put on or three we did not put on and two now that have not had their cross examination completed. I would say at [736] this time, your Honor, that unless it shortens up very, very quickly next week, we would be into the week of April 13th on our case. We are, of course, willing, with the Court's pleasure, to extend the time of the trial days. Actually, it is more in our benefit because most of these people are from out of town.

THE COURT: I will have to work a schedule out. That is the reason I wanted to ascertain it, because it is going beyond the estimated period of time in which I hoped to finish.

Will this witness be available on Monday, or are you going to discuss it with him?

MR. HEDLUND: I will have to discuss it with him, your Honor.

MR. CUSACK: Will Mr. Thorson be called Monday?

MR. HEDLUND: Mr. Cusack, I do not know how I can answer this unless we sort these other things out. On Monday we have a witness whom I have promised up and down would be on Monday, and that is Mr. Ernest Tremmel of the Atomic Energy Commission, Chairman of their Industrial Division. He is coming in with AEC counsel Sunday night, so I have to put Mr. Tremmel on one way or another Monday. I will have to talk to Mr. Davis [737] about his availability next week.

MR. CUSACK: We would like to know as soon as possible who you would like to call on Monday.

MR. HEDLUND: Mr. Cusack, you will know within moments after we reach a decision.

THE COURT: Let me make this suggestion: will both sides try to shorten their interrogation. I do not

like to keep harping on this, but there are repetitious questions by the plaintiff here, and one question could cover five as they are being asked. Now, you are all able lawyers, and it is dragging on and on with repetition and going back and forth. I know you can do it, Mr. Cusack. I do not want to circumscribe your examination, but we are taking what I would say is 50 percent more time than should be taken with carefully prepared cross examination. I wish you would keep that in mind.

MR. CUSACK: Yes, your Honor. I will review the cross examination of my colleagues.

THE COURT: All right, then, we will recess until Monday morning at 10:00 o'clock. Thank you. Check it out amongst you on this.

MR. HEDLUND: Very good.

MR. CUSACK: Thank you, your Honor.

[738] THE COURT: Good night, and have a good week-end.

(The hearing in the above-entitled cause was adjourned to Monday, April 6, 1970, at 10:00 o'clock a.m.)

[739]

IN THE UNITED STATES DISTRICT COURT
NORTHERN DISTRICT OF ILLINOIS
EASTERN DIVISION

No. 67 C 1632

UNITED STATES OF AMERICA, PLAINTIFF

vs.

GENERAL DYNAMICS CORPORATION; THE UNITED ELECTRIC COAL COMPANIES; and FREEMAN COAL MINING CORPORATION, DEFENDANTS

Before HON. EDWIN A. ROBSON, Judge,
Monday, April 6, 1970
10:35 o'clock a.m.

PRESENT:

MR. JOHN THOMAS CUSACK,
MR. ROBERT L. EISEN,
MR. RONALD L. FUTTERMAN,
MR. HUGO SIMS, and
MR. RICHARD J. BRAUN,

appeared for Plaintiff;

MR. REUBEN L. HEDLUND,
MR. DONALD G. KEMPF, JR., and
MR. RICHARD H. IRVING, III,

appeared for Defendants.

ALSO PRESENT:

MR. JAMES M. FOLSOM.

* * * *

[741] A. H. DAVIS,

called as a witness by the defendants, having been previously duly sworn, was examined and testified further as follows:

CROSS EXAMINATION

(continued)

BY MR. SIMS:

* * * *

[744] Q In other words, it is of benefit to you to have two coal suppliers in such a case as that so you [745] can

remind the other coal supplier that if he doesn't reduce his price, you will start buying the coal from the other?

A Well, as you know, Mr. Sims, we have had and still do have a number of suppliers, so we attempt to use whatever leverage we can to get the prices we can.

[746] Q Do you expect the price of coal to go up in the future?

A If we continue the inflation that we have had during the past several years, I certainly would expect that commodity as well as all commodities to go up in price.

Q Then is it your belief that coal companies will not respond adequately with sufficient supplies of coal to keep the prices stable in the future?

A I have no real belief in that area one way or the other.

Q Do you have any opinion as to whether coal companies will be able to improve mining technology and reduce the cost in the future?

A I would certainly hope so. I am not an expert in that field. I really don't know if they had planned or what their future might bring about.

Q Are you confident that if they should improve cost, they will pass these cost benefits on to you?

A Our contracts in general are based somewhat upon their production costs, so if they should increase their productivity, that will reflect back to us.

* * * *

[748] Q In the last five years it has gone up?

A When we have seen the inflationary trend, the cost per million BTU's has gone up.

Q Assume for a minute this unit you are planning to bring into service in 1976 will be a coal burning unit and will consume approximately one million tons of coal per year for its expected life of, let us say, 20 years.

Now assume Coal Company A offers to supply the total fuel requirement of this unit. That is, one million tons per year each year for 20 years.

Assume Coal Companies B and C are to supply you 500,000 tons each per year for 20 years and Coal Companies B and C offer their coal at a lower price than Company A.

Which company or companies would you award the contract to?

A Well, there is a number of factors to be considered there. In general, if you have one supplier that would supply you one million tons a year and you could unitize the shipments, and if you had the facilities to receive this unitized shipment, then in all probability the transportation costs would be less, so we would have to add up the cost the fuel at the mine, plus the [749] transportation cost, and based upon that I don't know which one would be the lowest.

Q My assumption was that the coal being supplied from Companies B and C, total delivered price, was cheaper than Company A. Which company or companies would you award the contract to in that situation?

A Well, let me frame my answer like this: Knowing the problems of the supply of coal, I doubt very much if we could get such a situation as you are speaking of. But if we could, I guess it would make no difference. You would take the lower cost.

Q You would award to Companies B and C?

A Right

[750] Q Take the same situation. Company A will supply you one million tons per year for 20 years. Assume Companies D, E, F and G come to you and each offers to supply you 250,000 tons each per year for 20 years. Companies D, E, F, and G offered you a lower price for delivered BTU of coal than Company A.

Which company or companies would you award the contract in that situation?

A Are we also assuming, Mr. Sims, that each one of these companies has the proper reserves?

Q Certainly.

A And did you say the cost per million BTU's amongst all of them was the same?

Q No. Companies D, E, F, and G yes: their delivered coal price was lower than the delivered price of Company A.

A The transportation costs are the same?

Q The total delivered cost was lower for Companies D, E, F and G.

A I presume that if we had one supplier that could supply all the coal and several suppliers that could supply some fraction of the coal, it would make no difference except in the bookkeeping that we were concerned with. We would much rather deal with one [751] supplier or say three suppliers rather than ten suppliers.

Q Would you much rather deal with one supplier than four suppliers, if the cost was cheaper with the four suppliers?

A Well, let me give you an indication of what we run into. If we have four suppliers of coal, which we do substantially now, and one of them runs into tipple trouble, which one of them has, then we have a problem with supply from that particular guy. From that producer, that is.

Now, I suppose that if you had ten suppliers, your possibility of running into transportation problems—let's take the cars. As you probably know, the cars available to the coal people are in very short supply. So, the more coal you ship out that is handled by one railroad, it gives you a much better possibility of receiving coal.

During this past year in the fall when the grain shipments were high, if we had had ten suppliers of coal, in all probability we couldn't have got any coal cars. So just from a practical standpoint, you are better off with one or two or three or four suppliers than with ten suppliers.

Q If you are being supplied from ten different [752] mines, and something goes wrong in the tipple of one mine, you usually can turn to the other nine to make up the balance of the production, can you not?

A I wish that were the case. It is not the case. The fact is that all of the producers are producing at their peak, and if we wished to pick up coal, we almost have to go out begging.

[753] Q Would you rather be faced with the situation in which one of ten suppliers could not supply you with coal or whether your only supplier could not supply you with coal?

A Well, I guess we're getting down to a problem of probability here, reliability. If we take them as being all adequately tooled up and everything, I suppose that if you had 100 suppliers, you'd be better off, and they were all going to deliver.

Q The present coal companies operating in the Fulton-Peoria area are Ayrshire, UEC, Truax-Traer, Peabody, and Pittsburgh-Midway, is this correct?

A Ayrshire or Republic is a little more remote from us than Peabody, Truax-Traer, and United. We pay a higher or would pay a higher, freight rate from Republic than we would from the other three.

Q Do you know if you would a higher price, total delivered price from Republic?

A Very definitely.

Q Have you received price quotations from them?

A Yes, we have.

Q Would you be concerned, Mr. Davis, as president of CILCO, of UEC and Freeman merged with Truax-Traer?

A As your Department undoubtedly knows, we made [754] a complaint several years ago about the merger of two coal companies in our area, and you have a reached a satisfactory settlement, I take it, with those two companies, so anything that we feel reduces the amount of competition in our area, we are certainly not that bashful about making a complaint. If Truax-Traer were to merge with, say, Peabody in our area, we'd make another complaint.

Q Why would that bother you, Mr. Davis?

A It's a reduction of competition in our area.

Q One less supplier—

A That's right.

Q (Continuing.)—supplying you with coal?

A That's right.

Q Then, do you feel it is a benefit from a competitive standpoint to have several independent companies in competition to supply you with coal?

A Oh, yes.

Q You said yes?

A Yes.

MR. CUSACK: Your Honor, may I speak to Mr. Sims for just a moment?

THE COURT: All right. You may.

(There was a short interruption, [755] after which the following further proceedings were had herein, to-wit:)

MR. CUSACK: Thank you, your Honor.
THE COURT: All right.

[756] BY MR. SIMS:

Q You testified that you first became aware of the Freeman-UEC association, I think, in about 1960?
A That's correct.
Q You are not in the position, are you, to tell what would have happened if UEC had been a competitior and were not associated with Freeman as of 1960?
MR. HEDLUND: May I have that question back, please?
THE COURT: Read the question.

(The question was read by the reporter.)

MR. HEDLUND: I am going to object to that question. I think it has an assumption that UEC is not a competitor. Do you mean with Freeman, Mr. Sims? The question isn't clear to me, your Honor. I object on that basis.

BY MR. SIMS:

Q That it was operated independently of Freeman.
MR. HEDLUND: I am still going to object. I think the question is hopelessly garbled at this point and cannot be understood.
THE COURT: Reframe the question.

BY MR. SIMS:

Q Mr. Davis, are you in a position to say what competition UEC would have offered Freeman or Freeman offered UEC had they not been affiliated as of 1960?
[757] A I will offer an opinion, Mr. Sims. As far as we are concerned, and we, I think, have so stated to your department, that the competition between Freeman and United did not affect us, one prime reason being that United had limited reserves. As far as we could see, the reserves back-up that was going to be provided by Freeman would be beneficial to the purchasers of coal, so we just don't believe that the affiliation between the two companies did anything to eliminate competition, specifically as far as we are concerned.

Q Do you know for a fact, Mr. Davis, that Freeman would not have offered you coal from their Crown mine but for the association with UEC?

A To the best of my knowledge, Mr. Sims, we have never had a Freeman salesman call on us, as far as I can say, forever.

Q But, do you know if one would have called on you after 1960, had they not been affiliated with UEC?

A I really couldn't say whether they would have or wouldn't have.

Q You supervised the preparation of the subpoena questionnaire sent to CILCO in connection with this case?

A Yes, sir.

[758] Q The questionnaire asked for, among other things, the price, including transportation costs, that CILCO paid for coal from each mine of its suppliers where the shipments were 20,000 tons or greater, is this true?

A Yes, sir.

Q Did you notice, when completing these questionnaires, that in 1967 you were paying identical prices to the penny, $4.68 a ton, for coal from Peabody's Fairview mine, Truax-Traer's Fiatt mine and UEC's Cuba mine to your Edwards station?

A Yes, sir.

Q You were aware of that?

A Yes.

Q I also notice that you were paying the identical price to the penny, $4.93 a ton, for coal from Truax-Traer's Fiatt mine, Pittsburgh-Midway's Allendale mine, and Peabody's Fairview mine to your Wallace station. Were you aware of this?

A Yes.

Q Does it concern you that for two of your largest generating stations you were receiving identical prices from several of your coal suppliers in 1967?

A No, it doesn't concern me, Mr. Sims. As I [759] mentioned earlier, what we try to do is we try to obtain the lowest cost per million BTU's from one or several of our suppliers, and then we try to use that leverage on the other suppliers to obtain substantially the same price.

[760] Q I see.

A (Continuing.) Now, today, due to different escalations, we are not paying that same price to our suppliers.

Q But, I noticed in the 1966 questionnaire, Mr. Davis, that you were not paying identical prices, you were not receiving identical prices, from these same suppliers. Is it your belief, then, that it was simply a coincidence that the prices happened to be the same for 1967?

A I really couldn't say. I'd have to review it. In 1966 we negotiated a new contract with Truax-Traer which substantially reduced the cost of coal to us. Today the cost per ton, they are about the best buy. The cost per million BTU's, the best supplier is United.

You see, substantially when we talk about cost per million BTU's, we are talking about one thing. We are talking about quality. When we are talking about the cost per ton, we're talking about a lower price, and really, we go by the cost per million BTU's.

Q I see.

I notice in the questionnaire that you had listed on the questionnaire that they had all identical BTU contents, and yet the price was identical, so [761] apparently they were selling you the coal at identical price per million BTU?

A I don't recall what the question on the questionnaire was. Was it BTU's specified?

Q Yes. They did specify what BTU's you received.

A Yes. No. Was the question—on the questionnaire, was it BTU's specified?

Q No. It was the BTU's in the coal delivered to you from the companies.

A All right.

Q They were identical BTU's?

A I expect the answer there was our average BTU received. I don't know.

Q But, at any rate, you did not bring it to the attention of the president of the Antitrust Division, the price that you were receiving, identical prices from these coal producers in 1967?

A I see no reason why we should.

Q Would you take the contract from the first coal producer and would you go to the next one and say, "This is what I received on this contract, and you could give me

the coal at the same price"? Is that the way you handle it?

A Normally the coal has been pretty much the [762] same cost per ton. The varying factor has usually been the transportation cost. Now, these tariffs are pretty well published, so we simply point out to the suppliers that we can obtain transportation cost from such and such a mine at whatever cost it is.

[763] Q How do the coal companies determine what the mine cost of the other coal companies is?

A I haven't the slightest idea.

MR. HEDLUND: I am going to object to that. I do not believe this witness is qualified to say how coal companies find out about other coal companies' costs.

THE COURT: If the witness knows, he may answer.

BY THE WITNESS:

A I haven't the slightest idea.

BY MR. SIMS:

Q Did you analyze the coal from Freeman's Crown mine to see if it would burn in your boilers properly before entering into the contract with UEC in 1968?

A We did not.

Q You would assume it would burn properly?

A We made that assumption, yes.

Q I see.

Was there any reason for you to believe that it will not burn properly in the same boilers which you burned the UEC coal in?

A From what they told us of the coal, we assumed that it would burn properly.

MR. SIMS: I have no further questions at this time.

[764] THE COURT: Is there any redirect?

MR. HEDLUND: Yes, your Honor.

REDIRECT EXAMINATION

BY MR. HEDLUND:

Q Mr. Davis, is it likely that the transportation costs involved in a shipment of a million tons from a single sup-

plier would be less than 500,000 tons each from two suppliers, or 250,000 tons each from four suppliers?

A Well, in our negotiations with our railroads, for the most part the railroads would very definitely like to have shipments in the neighborhood of a million tons. We have one railroad that won't even consider shipments less than a unitized train. So, if you ask this particular railroad to haul a shipment of 250,000 tons, they wouldn't even consider it. So, very definitely the transportation cost is based upon unitized haul and tonnage, volume shipments.

[765] Q Is CILCO still out trying to obtain new gas customers?

A Yes. We are trying to obtain new gas customers. We have a very definite effort going on to sell our gas supplies.

Q In the discussions with Humble Oil in terms of trying to or being interested in supplying your stations in Peoria, were they able to present sufficient information for you to know whether, had you gotten a bid from them, their price would have been competitive with Fulton County coal?

A Humble Oil at the time they approached us had just decided to open up a mine and get into the mining business. While they quoted us a price or suggested a price they thought they could deliver the coal to us at, they had no specific information and had not made a firm offer as such, had not presented a contract as such, had not indicated what the transportation to us would be as such. They were very scanty in their information. As a matter of fact, I think looking at the mine safety laws that have been passed since they made their initial approach, we would expect their cost per ton of coal to have increased perhaps 60 or more cents per ton, which would have undoubtedly created an escalation that would [766] have put them out of order.

Q One final question, Mr. Davis. Can you give me some sort of feel of the average length of haul by railroad or any other means of transportation you have with respect to coal shipment to your Peoria area stations?

A The length of haul to our Peoria area stations varies from 30 to 45 miles by railroad.

MR. HEDLUND: That is all I have, your Honor.
THE COURT: Any recross?
MR. SIMS: Yes, your Honor. One question.

RECROSS EXAMINATION

BY MR. SIMS:

Q You mentioned the mine safety laws, Mr. Davis. Should this make strip coal more attractive now with the increased cost of deep mines?

A Strip coal is affected to a lesser extent than deep mine coal. I don't know exactly what this extent will be, but to a lesser extent.

• • • •

[770] ERNEST B. TREMMEL,

called as a witness by and on behalf of the Defendants herein, having been first duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. HEDLUND:

Q Would you please state your name and occupation.

A My name is Ernest B. Tremmel. I am employed by the U.S. Atomic Energy Commission. My title is Director, Division of Industrial Participation.

Q Now would you please describe your duties and responsibilities as Director of the Division of Industrial Participation?

A In about 1961 the U.S. Atomic Energy Commission decided to establish a Division of Industrial Participation because under the Atomic Energy Act the Commission is charged not only with developing nuclear energy, for weapons for the security of our country, but also to develop the peaceful uses of nuclear energy that might benefit our way of life.

Along with developing the peaceful uses, the Act itself said we should develop a competitive industry.

So in 1961 the Commission established [771] this division, whose purpose was really about three-fold.

First was to be a focal point for American industry, so that in the Atomic Energy Commission American industry would have one place to come to learn about what the opportunities were for the peaceful uses of nuclear energy.

The second function was to review the research on the work done in our laboratories throughout the nation, in government-operated laboratories, to determine what activities had reached a point of technology where they might be applied to commercial utilization by our system in our country.

[772] The third function was to report to the Commission at least annually on how successful the Commission was in carrying out its responsibility of developing peaceful uses of nuclear energy. This is done by means of a report that our Division puts out, and through the annual report of the Atomic Energy Commission.

We had a fourth function later assigned to us, and that's to be a point of contact for the states, strictly from, primarily from trying to attract new industry to the states. We were the place where the states representatives could come to and say what kind of industry in the nuclear field seems to make sense in our state.

Then we had a fifth more minor function added that is to look at spin-off typical of the NASA spin-off program, to look at things in our laboratory, techniques or machine tools or applications that were non-nuclear that might have use in private industry.

BY MR. HEDLUND:

Q Could you now briefly give us a description of the highlights of your career or your background?

A Yes. I graduated from the University of Wisconsin in Madison, Wisconsin, in 1941. I spent about [773] a year working in the aircraft industry and then joined the U.S. Corps of Engineers, where I worked on the construction of a small arms plant for about two years. In about 1943 I joined a secret project called the Manhattan Engineering District, at which time I did

not know myself what they were doing, but we knew it had something to do with the war effort, and I spent about eight years from 1943 to about 1950 working on the atomic bomb program.

In 1950 I transferred to our Chicago operations office, which manages the Argonne National Lab, and transferred to our programs for peaceful uses of nuclear energy. From 1950 until 1960 I spent my time, about three years, at Argonne National Lab on basic development of nuclear energy, and I spent about five years on work related to the development of a nuclear propelled aircraft, and then around 1958 or '59 I transferred to our headquarters to work as an assistant to Commissioner Floberg and then Commissioner Wilson, and then—

Q These were Commissioners of the Atomic Energy Commission?

A These were Commissioners of the Atomic Energy Commission. I spent about three years working [774] as an assistant to the Commissioners.

In 1961 when the Division of Industrial Participation was established, the Commission named me as the Director of that Division, which position I am presently holding.

Q Thank you.

When was the Atomic Energy Commission created?

A The Atomic Energy Act was first passed in 1946, and that set up a civilian agency to handle the nuclear energy program.

Q Are you familiar with the activities of the AEC and of American industries since World War II in developing nuclear energy as a source for the generation of electricity.

A Yes, I have been directly or indirectly connected with these programs, so I feel I am very familiar with all of these programs.

Q Would you then, please, briefly relate the history of that development first through the year 1964?

A Well, as early as 1946 when the Atomic Energy Act was passed, a number of chemical companies in the United States began some studies to take a look at the application of nuclear energy to central station power.

[775] Q By "central station power" you mean an electric utility?

A Electric utility industry.

From about 1946 to around 1950 or '51, there were a number of these studies carried out, and around 1950, in that time period, the AEC itself undertook what we called an experimental reactor program, and under that program we built an experimental boiling water reactor at Argonne National Laboratory, and in connection with the Navy program, Admiral Rickover's program, a pressurized water reactor was built at shipping port. The reason why I mention these two is because the light water reactors that are being sold today are either based on boiling water or pressurized water technology, so that the experimental boiling water reactor at Argonne was an experiment to demonstrate that you could satisfactorily make such a machine work, and the Shipping Port project was an experimental reactor to show you could generate power from pressurized water.

Now, following that the Commission then went forth with what we called a power demonstration series of rounds. We had three different times when we went out for public invitations to encourage private industry [776] to carry this technology from these experimental reactors into practical use. As a result of these demonstrations, there were two large reactors built. One was the Dresden No. 1 outside of Chicago,—

Q By whom was that—

A (Continuing.) —the Yankee Atomic Power Plant up in New England. The Dresden No. 1 was a boiling water reactor, and the Yankee Atomic Power Plant was a pressurized water reactor.

Q I am sorry to interrupt you. I just wanted to ask you who actually built Dresden No. 1, what utility?

A Dresden No. 1 was built—I would like to explain this in a little more detail, that under this invitation under the first round, it called for a cooperative effort between a utility, a private manufacturer, and the United States Government through the Atomic Enery Commission, and the concept was that one would build the plant which would be built actually on a utility

system, so that you could demonstrate the generation of power from a nuclear plant and its use, but that it would not, necessarily, be economical. In other words, the power might cost more than if you had put a fossil plant, but the extra cost was picked [777] up by all three participants, the utility, the Atomic Energy Commission, and the manufacturer, in order to demonstrate the practicalness off utilizing nuclear power on the utility system.

The one at Dresden was a combination of General Electric, Commonwealth Edison and the Atomic Energy Commission. The Yankee Plant was a combination of a group of New England utilities, Westinghouse, and the Atomic Energy Commission.

I wanted to also mention that under these invitations we had three rounds. The first round was directed more at the large utilities in our country. The second round was directed at the smaller utilities, the municipals and the REA, to give them a chance to get some knowhow in this new field, and the third round was pretty much general again.

Following the Yankee and Dresden Plants, both General Electric and Westinghouse next offered commercial plants on a strictly unsubsidized, economical basis.

There is one other interesting point there, that in both of these cases General Electric and Westinghouse offered plants at a date somewhat before they had gained a lot of experience in actually operating [778] Dresden or Yankee, but these two initial plants led the road for these two companies to move into the commercial field. [779] Q Could you mention some of the stations that were built in what you have referred to as the second round of the program?

A Yes. The second round was directed at small plants, such as Elk River, the Pathfinder, and Dairyland, and the Piqua plant.

Not to take up a lot of time, but there were other concepts of reactors that were cooled with other coolants than light water. The Piqua plant, for example, was a small plant which was built to see if an organic cooling material might make more sense.

The Pathfinder plant was built to demonstrate a different purpose, to demonstrate how one might generate steam and whether you could have superheat. There were two plants built, Puerto Rico and Pathfinder, to see whether superheat might make sense in a nuclear reactor.

Q Who was the utility involved in the Pathfinder?

A That was Northern States Power Company.

Q And you mentioned Dairyland—

A Dairyland Power, in my hometown, LaCrosse, Wisconsin.

I might say, so that the record is clear, [780] that the Commission had responsibility to develop competition, as this nuclear industry was developed. So we feel we were rather unique in that here is a technology that was born as a Government monopoly, and we had a goal to transfer this technology into the private sector of our economy and create a competitive industry.

So in addition to GE and Westinghouse, Allis-Chalmers was the original company that went into this cooperative program on the Dairyland, and I believe the Pathfinder also was Allis-Chalmers.

We also had been and were building a cooperative program at Consolidated Edison in New York called the Indian Point. So we brought a number of companies—B&W, General Electric, Westinghouse, and Allis-Chalmers—into the field at an early date in order to get and to give a number of companies experience, equal experience, so they could enter the field.

[781] Q "B & W" is Babcock & Wilcox?

A Yes.

Q Could you tell us, please, of the significant changes which have occurred in the position of nuclear energy as a source of generation of electricity since 1964?

A Well, actually the first nuclear power plant that was considered to have been sold strictly on an economical basis—in other words, that it could compete with fossil fuel plants and was purchased by the utility because it was the cheapest source of power—was the Oyster Creek Plant. That was contracted for in 1963.

From 1963 until the middle or end of 1965 there were no more nuclear power plants contracted for. In fact,

the President at that time had asked Dr. Seaborg, who was Chairman of the Atomic Energy Commission, whether we were ever going to really make these plants competitive, as were were putting a lot of money into developing nuclear power.

Around the latter part of 1965 what we called a surge to nuclear power occurred. Around the last part of 1965 the ultilities purchased seven nuclear power plants totalling over 4,000 megawatts.

[782] Then in 1966 they purchased 20. In 1967 they purchased 31.

Q These are thousand megawatts?

A These are number of plants.

To put this in better perspective, both in 1966 and 1967 the amount of nuclear capacity or generating capacity purchased was about 50 percent of the total. In other words, the other 50 percent was fossil-supplied power of one sort or another.

So to show what happened here, even in the Atomic Energy Commission there was none of us, nobody in the industry, that would have dared be this optimistic as to say that nuclear power would come into practical use—not practical use, but would be ordered this rapidly. So of course in the Commission we were surprised and happy to see that it was finding this commercial application.

Now, in 1968 the orders fell off to about, I believe, 15. Last year, 1969, there were either 7 or 9 plants purchased, depending upon what year you want to put 2 plants that were purchased at the end of the year—some people throw it into orders for 1969; others have put it into orders for 1970.

So the total amount of nuclear power [783] ordered to date, and these are firm orders, is about 130 plants or around 75,000 to 80,000 megawatts.

[784] Q Has the Commission prepared a compilation of the nuclear plants that are under construction, that have been ordered or that are likely to be announced?

A Yes. We prepared two reports. One is an official AEC press release, which comes out about quarterly,

which lists the plants and their locations and also breaks them down by what states the plants are in.

Then my particular division prepares a report in which we list plants on order, in operation or under construction, and we prepare that, but not necessarily quarterly. We change it whenever we feel there has been any significant changes.

Q I show you what has been received in evidence as Defendants' Exhibit 107, and I ask you if this is the first compilation to which you have referred?

A No. This is the second. That is the second one to which I referred in my statement.

Q I am sorry. This is the one that is prepared by—

A This is the one that is prepared by my particular division, and it was primarily prepared for internal use, although we make public distribution. The utilities and industry use this kind of data in [785] determining their own marketing.

Q I see that on the first page of Defendants' Exhibit 107, the central station nuclear plants, under the column "Utilities considered likely to place orders in 1970," is listed the Commonwealth Edison Company. Also the Tennessee Valley Authority.

Could you tell us how you determine that such orders are likely to be made in 1970?

A Well, part of our function, as I said earlier, is to report annually, at least to our Commission, and keep our Commission informed of the commercial uses of nuclear power.

What we do here is to try and list from our contacts with American industry what actually we think will be in the marketplace in the next year for nuclear power.

This is in order to keep our Commissioners informed of the status of the industry.

We determined this by our contacts with both the manufacturers and our contacts directly with the utilities themselves. We have just recently changed this. We said "Likely to order," and it is done here just to give our own people a feel of what utilities are in the marketplace currently.

[786] Q I show you now, Mr. Tremmel, what has been received in evidence as Defendants' Exhibit 108. I ask you if that is the other compilation to which you have referred?

A Yes. This is the other public release that the Commission puts out. This was really the one that gets broader distribution. The one that we put out is directed more for the concerned industry's direct use. This is made more for the public. The both of these are coordinated carefully so that the figures are in general the same.

Q On Defendants' Exhibit 108, this gives you a listing of installations by state, does it not?

A Yes, sir.

Q On that there are installations listed in Illinois, Indiana, Wisconsin, Iowa, Tennessee, Michigan, are there not?

A Yes.

Q Now, Mr. Tremmel, what particular factors accounted for the growth of nuclear power starting in the year 1965, or 1963, as I believe you stated it really began?

A Well, we think the reason why the utilities went to nuclear power was primarily based on the fact [787] that nuclear power in competitive proposals came out more economical in the long run than the fossil plants.

We think that subsequently there are other factors which have pushed nuclear power—let me say which have influenced the utilities in purchasing nuclear power plants. One of these a few years ago in the 1966 and 1967 period was the concern over air pollution. We think that some of the utilities favored nuclear power because they thought it would be helpful in eliminating air pollution. But we think basically there is no question in our minds that the utilities bought nuclear power plants because in their judgment the power generator would be more economical to the customer from these plants than from fossil plants.

Q Has the construction of nuclear plants been limited to any particular area of the country?

A Not necessarily so, with the exception of the Rocky Mountain states, and the gas belts through Texas, where

there is very cheap natural gas. Nuclear power plants have been ordered in all other sections of the country.

[788] Q Would that include the midwest?

A Yes. Now, originally—I think it is important here to have a little background on this, if it is all right with the Judge.

THE COURT: You may proceed.

BY THE WITNESS:

A Originally we thought that nuclear power would first come into being in the New England states because there is no coal and the transportation costs for fossil fuels in New England has been high.

It has been known as a part of our country where the cost of electricity is high.

So, we predicted that nuclear power first would become economical there. Then we predicted it on the West Coast, primarily California.

Our predictions were quite correct on New England, but in Southern California, as you know, in the earlier days, nuclear ran into some opposition.

What happened is nuclear power came into being in the middle west and in the southeast, and we were surprised as to what extent nuclear power was ordered by utilities, such as Commonwealth Edison, and TVA, where we had figured because they were close to mine-mouth coal, it would be very difficult for nuclear [789] to compete for some years.

But what happened in 1966 and 1967 is nuclear power plants were ordered in all sections of the country, with the exception of the Rocky Mountain States, and the Gas Belt in the Middle South.

Q I believe, Mr. Tremmel, you have referred to the decline in orders for nuclear plants that took place in 1968 and 1969. To what do you attribute this decline?

A There are a number of factors which I think accounted for this decline. Number one, we knew at some time the pace of nuclear orders could not continue at the rate it had, because the utility industry historically is known for ordering on a cyclical basis. In other words, you will reach a curve where it will hit a high point (in-

dicating), and then there will be a low point in the ordering, and then another high point again.

If one looks at the years 1955, 1956 and 1957, that period, and plots the sale of turbine generators, you would see the utilities had been ordering at a rate that was doubling the capacity every two years. We know that the capacity of the country doubles every ten years, so it was obvious this rate of ordering could [790] not continue.

We think they ordered nuclear plants probably at this pace because it takes longer to build a nuclear plant, and, secondly, they wanted to allow themselves more time because this was a new technology. So we knew that there had to be a fall-off in nuclear orders.

Another factor is that if you examine the size of these plants that were sold, the utilities were ordering plants that were three times to four times the size of any plant in existence that had operated.

[791] Q That would be regardless of fuel type?

A Regardless of fuel type, so that it would only seem prudent that any large utility that had ordered two or three nuclear plants would want to wait until one or two of these plants started operating before they ordered many more, just to gain experience, and we think this was a factor.

Now, I think we should also not disguise the fact that building these nuclear plants turned out to be a much more involved problem than the constructors and architect engineers had envisualized, so that delays were encountered in the construction of these nuclear plants, which in some cases the utilities had to order fossil plants in order to have capacity on the line for when it was needed, and because of the delays in the construction of the nuclear plants.

Q Does the size of a nuclear plant have any effect on its cost?

A It has a very definite effect. Nuclear plants tend to be higher-cost capital plants than fossil plants, and it's only at about the 500 megawatt range that nuclear plants have been able to compete in the marketplace with fossil plants.

Now, as nuclear plants get larger, they [792] tend to be more competitive than the fossil plants. The advantages seem to favor larger nuclear plants over, the cost, over fossil plants, but still the capital cost is higher, where the operating cost of a nuclear plant is lower. This is a fixed, some fixed ground rules that one ought to accept.

Q Do you have an opinion as to, say, by 1975 the size of nuclear plants that will be offered for sale?

A Yes. We think by 1975 the plants being offered for sale will be in the 1,100 to 1,500 megawatt size.

Q If I may pause there, do you have sufficient facts at your command to have an opinion as to the amount of coal that an 1,100 to 1,500 megawatt coal-burning plant would consume a year?

A No, I don't.

Q At the present time, Mr. Tremmel, what do you estimate to be the average capital cost of a nuclear energy generating plant to be per kilowatt hours?

MR. SIMS: Your Honor, I will have to object to this. I do not think Mr. Hedlund established a foundation to ask Mr. Tremmel cost information of this sort. I think that in testifying as to his background he did not testify that he did any cost studies, or his particular [793] division was engaged in drawing up cost studies on these nuclear plants.

THE COURT: Do you have any comment?

MR. HEDLUND: Your Honor, I think his position speaks for itself in terms of his role in the function of the Division of Industrial Participation. I would assume that this would be something that they would try to keep a close check on.

THE COURT: Lay the foundation.

BY MR. HEDLUND:

Q Mr. Tremmel, does your division collect facts or data that would permit you to give me a knowledgeable estimate of the average capital cost of nuclear energy generating plants at the present time?

A Yes, we do.

MR. HEDLUND: I will rest on that, your Honor. I think that is sufficient.

THE COURT: Yes, Mr. Sims.

MR. SIMS: Well, if he has knowledge of the information and can testify to what information these cost studies are based on, then I have no objection, but otherwise I would object on hearsay.

THE COURT: All right. Proceed.

[794] BY MR. HEDLUND:

Q Mr. Tremmel, would you give us, please, a description of the type of information that you collect in this regard and the analysis done on it.

A We keep in close contact with the utilities, so that we can have some idea what the cost of nuclear power plants are running, and we prepare detailed breakdowns of what composes these costs. In other words, how much are capital costs and what the cost of the fuel cycle is so that we can furnish this information to our Commission.

For example, Commissioner Seaborg, Chairman Seaborg just came back from Japan where he made an international speech, and he made a statement in there of what the cost of nuclear plants are running today in the United States, and part of this information, our division contributed information of this along with other divisions so that our Commissioners keep informed of what the costs are running.

We also try to keep some general idea of what fossil plant costs are running, and we do this through talking to utility presidents and executives, and that is one of the functions of my division.

Q Then, Mr. Tremmel, I return to my question, [795] based upon the data which you have just described, can you estimate the average capital cost of a nuclear energy generating plant per kilowatt hour at the present time?

MR. SIMS: Your Honor, may I ask him one question on voir dire?

THE COURT: On voir dire?

MR. SIMS: Yes, sir.

THE COURT: I think the foundation has been laid. You have the right of cross examination.

MR. SIMS: He said he talked to electric utilities concerning the costs. I simply want to find out whether he got from them the awarded contacts that they received.

THE COURT: You have the right of cross examination. Objection overruled.

Proceed.

BY MR. HEDLUND:

Q Do you have my question in mind, Mr. Tremmel?

A Yes, sir. I would like to answer that two ways.

Originally, the nuclear plants that were sold, the companies like General Electric and Westinghouse, in order to promote nuclear plants, sold these plants at a rather reasonable price, and these plants [796] are usually averaged out so that in order to make a profit the company might have to sell 10 plants, so that the first plant would be considerably cheaper than it might cost to produce it. So, the utilities—we call it, so-called, buying into the industry—the utilities bought some of these early plants as low as $100 a kilowatt. These are published numbers by the utilities in some cases. In the Florida Power & Light, for example, they bought two plants at less than $100 a kilowatt. The later plants, then, that are on order, they begin to go up to 140, 150 and 170 dollars a kilowatt, so that the present plants under construction, when they are completed, will probably average around $170 a kilowatt because there have been significant increases in these plants, the cost of construction, since many of them were ordered.

Currently, from the best information we have assembled, nuclear plants are selling from around $190 to $240 a kilowatt, and Dr. Seaborg just used in his Japan speech, $200 to $240, to give some idea of what the present large plants are, and if you will look at the list, I believe it is your DX-107, we give some indication of the cost of the plants.

If you look at the first page, at the top, [797] you will see a Cincinnati Gas & Electric Company plant that was

sold by GE, 810 megawatts, and you will see the estimated cost is $179, so that—

Q That is $197, is it?

A Pardon me, $197 million dollars, so that you can get some idea of what these plants are costing.

[798] As I say, if one extrapolates this to kilowatts, you begin to get a feel of the cost per kilowatt.

Q The estimated cost figures in that column, those are not per kilowatt, that is the total cost?

A No, you have to divide that by the size.

Q If the tendency to larger plants increases, will there be any reduction in the cost per kilowatt?

MR. SIMS: Your Honor, I will object to that as speculative.

THE COURT: What is that?

MR. SIMS: It is speculative.

THE COURT: If the witness knows, if they have estimates, he may answer.

BY MR. HEDLUND:

Q Do you have such estimates?

A Yes, we have done studies in the Commission of the trend of cost for large nuclear plants, and we think that the larger a nuclear plant is built, it will tend to decrease the cost, the capital cost. Of course, I don't want to mislead anybody here that that means cheaper power. Inflation might make the cost somewhat higher, but what I am saying is that the larger the size of the plant, there is a tendency for the cost, [799] the capital cost, to come down. That's what our studies show.

Q Compared to fossil fuel plants, is there any saving in the cost of fuel involved in a nuclear generating station?

A Yes. Inherently, as I explained earlier, a nuclear plant will operate, just strictly fuel cost, considerably cheaper than a fossil plant, and although the capital cost is higher, when you balance the total cost, this is why the utilities have gone to nuclear, because the total operating cost will tend to be lower in many cases due to the cheaper fuel cost.

Q Do you have sufficient facts, or have you developed sufficient data, so that you would be able to estimate the final capital cost for nuclear plants which are planned to come into operation in the period 1974 to 1975?

A Yes. As I said earlier, we think they'll average around $170 a kilowatt.

Q In your opinion, Mr. Tremmel, has the differential between capital cost of building a nuclear station and the capital cost of building a coal-fired station remained the same over the past four years or has it spread?

[800] A No, it's remained essentially the same. The Commission, in our speeches by our Commissioners, have said that in general the differences in capital cost will be between $30 and $40 a kilowatt. It was that way five, six years ago, and the current difference would still, from the best of our estimates, be about that, and incidentally the Federal Power Commission, in their public statements, have estimated about the same differences.

Q In your opinion, Mr. Tremmel, is nuclear energy presently a competitor of coal as an energy resource for the generation of electricity?

A There is no question in my mind but it is.

Q Since approximately what year or years has nuclear energy been such a competitor?

A Since approximately 1965.

Q Is nuclear energy, in your opinion, a competitor of coal as an energy resource for the generation of electricity important even in coal mining areas of the United States?

A Based on the orders placed by the utilities, we would assume it is.

Q If we may go back again to the future, Mr. Tremmel, do you expect that nuclear energy will continue [801] to increase its penetration of the electrical generating business between now and 1980?

A The Commission has given out official forecasts, and our latest official forecast is that by the year 1980 there will be 150,000 megawatts of nuclear capacity installed in the United States. The present amount on order, operating or under construction, as I said, is

close to 80,000. This means we are predicting that another 70,000 megawatts will be ordered and installed and operating by 1980.

[802] Q About what percent of the total generating capacity in 1980 will that represent, if you know or have an opinion?

A Yes. The reason I hesitate is we base a lot of our estimates on the Federal Power Commission studies of the total amount of electricity required by our country, and the Federal Power Commission has just, in public testimony, released some new estimates. They have changed their estimate of the total amount of electric generating capacity required in the United States in 1980 from approximately 600,000 to approximately 680—pardon me—that's million kilowatts. Based on that, our 150,000 would represent somewhere around between 20 and 25 percent of the total generating capacity installed.

Q By 1980?

A By 1980.

Q Would this mean that nuclear would also be responsible for 20 to 25 percent of the electricity generated?

A No. We estimate that it would be responsible for a higher percentage of electricity generated because in general the nuclear plants will be operated as base load plants. They are large and they will be [803] kept on the line more than the other types of plants, so that it might account for between 30 and 35 percent of the electricity generated in the United States by 1980.

Now, these are just our best estimates.

Q Are you familiar with the estimates published by the Edison Electrical Institute?

A Only very generally.

Q Do you know what the Edison Electrical Institute's estimates are at present with respect to 1980?

A I don't believe they've come out with any recent estimates, but three, four years ago their estimates were somewhat higher than ours. I think they were estimating around 170 to 190.

I would like to say that if one got the Commission's official document, our estimate is a range. We're estimating 130 to 170,000 megawatts by 1980, with a

medium of around 150, so that we tend to use the 150 as the estimate that we expect to be reached.

Q Do nuclear fuel power plants offer advantages or disadvantages over fossil fuel power plants with respect to air pollution?

A We feel in the Atomic Energy Commission that [804] they offer advantages, since there is practically no air pollution of any kind from a nuclear plant.

Q Does this benefit, in your judgment, have any effect upon the competitive position of nuclear energy in the electrical generating field?

A Yes, we think that it definitely has effect, and one of the reasons for this is the fact that in southern California they will not allow any more fossil plants to be built because of the air pollution problems so that southern California will be committed to nuclear plants only in the future.

MR. HEDLUND: May I have just a moment, your Honor, and I will try to shorten this.

THE COURT: You may.

(There was a short interruption, after which the following further proceedings were had herein, to-wit:)

BY MR. HEDLUND:

Q Is the Atomic Energy Commission presently working on the development of more advanced types of nuclear reactors for electrical generation?

A Yes, we are. In our program, I have explained the light water reactors. We have been working on two other types of power plants that we call more [805] advanced. One of these, the high-temperature gas-cooled reactor, is being developed by Gulf General Atomics, who recently bought out this gas cooled program from General Dynamics, and it's located out in LaJolla, California.

Gulf General Atomics has just recently submitted a proposal to the Eugene Water & Electric Board on an 1100, approximately, megawatt gas-cooled reactor. The difference would be that this reactor would use gas as a coolant instead of light water.

[806] GE has quoted on a boiling water reactor. Westing house, B&W and Combustion have all quoted on pressurized water reactors, so that this utility received five proposals, and Gulf is hoping to now enter the field with their first commercial high-temperature gas-cooled reactor. This reactor will operate at higher steam pressures and temperatures, so that its efficiency as far as the amount of cooling water discharges would be the same as a fossil plant.

The present nuclear plants discharge slightly more heated water than an equivalent-sized fossil plant.

The high-temperature gas-cooled reactor offers, should offer, two advantages. One is discharge of less heated water, and the other is it would burn up less uranium than a light water reactor.

Now, coming behind that, the AEC today, we have phased out of the Government supporting light water reactors. We are still supporting some support to the high-temperature gas-cooled, but our main effort today in the Government is directing our funds toward developing a breeder reactor. Now, the difference between a breeder reactor and these others is that a breeder reactor will actually make more fuel than it consumes. [807] In the light water reactor, when you are burning up the uranium, the U-235, you actually make in the fuel elements some additional fuel by converting U-238 to plutonium, so you are generating some additional fuel, but very little.

In a high-temperature gas-cooled reactor, you make more of this plutonium, and in a breeder reactor, you convert enough of the natural uranium that is not used in the reactor to plutonium, so that the breeder reactor actually generates enough fuel to refuel itself with slightly over, to start refueling another reactor.

Our goal in the Commission is the breeder reactor as the ultimate, because it would mean that we would have almost unlimited resources for power in our country.

Q Your description of the fuel aspects of it, is this what is sometimes referred to as a negative fuel cost?

A Yes.

Q When do you believe that the breeder reactors will be commercially available?

A The Commission has a target to try and have breeder reactors commercially available in the 1980's. We have not been specific on any year because it's very [808] difficult to estimate that, but our goal is to, at the end of this year, select a reactor manufacturing utility in combination with the AEC to build a demonstration plant similar to the Yankee and Dresden. This would be a plant, though, of 500 megawatts.

Hopefully, after that plant has been built and operated, we would hope that the manufacturers would be offering these plants commercially later on.

Q In your opinion, Mr. Tremmel, will nuclear energy continue to afford to utilities a choice in the type of plant they decide to buy?

A We are committed in the AEC to develop competition in nuclear industry, so that as far as within the nuclear industry itself, we see a utility having a choice from five suppliers of three different types of machines. If the breeder comes in in 1980, it would offer probably a sixth supplier, and a fourth concept to choose from.

Q Would nuclear energy also afford a choice for utilities as among energy sources?

A Yes. We've stated consistently since 1963 that atomic energy is not going to put fossil fuel out of business, but is part of the energy team. The demand in this country for energy is so great that we've said [809] it is going to take a lot of energy resources to meet it, and we feel that nuclear power is part of this energy team for the future.

I wanted to just add one more thing about the breeder program, and that is that the Commission is concentrating—there are a number of different types of breeders. We have concentrated on what we call a fast liquid metal breeder reactor as the first one we would try and bring commercially into use in the United States.

(There was a short interruption, after which the following further proceedings were had herein, to-wit:)

[810] Q Mr. Tremmel, I would like to ask you whether you agree or disagree with the following statement—

THE COURT: What page? Is this in the transcript?

MR. HEDLUND: I am going to rephrase something from the transcript, your Honor.

THE COURT: All right.

BY MR. HEDLUND:

Q Do you agree or disagree with the following statement:

> "The presence of nuclear power as a competitor has assisted materially in controlling the cost of fossil fuels."

Do you agree or disagree with that statement?

A Yes. We believe that nuclear power has been an effective mechanism to help keep the cost of electricity down in the United States.

Q In your opinion, in the long term what combination of generating units will provide the lowest cost electricity?

A Well, we like to think that it will be a combination of nuclear, pump storage, with gas turbine for peaking units.

Q One final question: How many orders for nuclear fuel generating stations do you expect will be [811] placed in the next two or three years?

A We expect that there will be around between 10 and 15 plants each year for the next few years.

Q This would be a higher level of ordering than was experienced in 1969?

A Slightly higher. If you put two of these orders back in 1969, you had nine plants. We expect, as I say, 10 to 15 in these two years. I might say that at the rate of 10 to 15 plants a year, we can easily reach the 150,000 megawatt estimate for 1980.

MR. HEDLUND: Your Honor, may I have just a moment to confer with my associate?

THE COURT: You may.

> (There was a short interruption, after which the following further proceedings were had herein, to-wit:)

MR. HEDLUND: Your Honor, that is all we have.
THE COURT: You may cross examine.

[812] CROSS EXAMINATION

BY MR. SIMS:

Q Other than electric utilities, Mr. Tremmel, are there any other coal consumers at the present time in a position to burn nuclear fuels?

A I am sorry, but would you repeat the question, please?

THE COURT: Read the question.

(Question read by the reporter.)

BY THE WITNESS:

A There are only two other potential areas. One is process heat. There have been two nuclear plants sold to the Consumers Power Company in Michigan that will be located in order to provide both electricity and process heat to the Dow Chemical Company.

There was an article in Nucleonics Weekly several weeks ago that the Eastman Kodak Company is considering a nuclear power plant to supply process heat for their Eastman Kodak Park.

One other area that we see a potential for nuclear energy is in central station heating. If at some day in the future it is possible to locate nuclear plants in highly populated areas, like New York City, one could use the heated water for central heating like some of the cities used to have. But that is some years [813] away.

But the process heat, as I say, Dow Chemical and Consumers together are building two plants now to use both electricity and process heat. Those are the only two areas that I foresee right now.

Q Are nuclear fuels burnable at generating stations designed to burn coal, gas or oil?

A No, they are not.

Q Generating stations burning gas, coal or oil are generally referred to as fossil fuel plants, is that correct?

A Yes, sir.

Q How did the AEC go about preparing this 1967 forecast of nuclear power?

A The forecast—?

Q The most recent one.

A I see what you are talking about, yes. That is done by a number of divisions in the staff. We have a division called Division of Operations Anaysis. This division is a group of economists and technical people whose job it is to develop forecasts for the Commission. The Government, you see—well, we didn't get into any testimony today on the nuclear industry that supplies fuel to these plants, but the only service [814] today that private industry does not supply to a utility is the enriching function. The AEC has transferred all of its activities and created a competitive industry in all areas except this enriching.

* * * *

[819] AFTERNOON SESSION

2:15 P.M.

* * * *

ERNEST TREMMEL,

called as a witness by and on behalf of the defendants herein, having been previously duly sworn, resumed the stand and was examined and testified further as follows:

CROSS EXAMINATION

(continued)

BY MR. SIMS:

* * * *

[820] Q Do electric utility executives come to you from time to time for advice on building a nuclear plant?

A Yes, they do.

Q Assume an electric utility executive came to you at the present time knowing very little about nuclear power, but indicated to you that he was interested in building a nuclear plant.

What differences, if any, would you point out to him between a regular fossil plant and a nuclear plant?

A I would point out that the technology, nuclear technology, is much more detailed and complicated than a fossil plant, and that the utility ought to start building up a staff at the very early period of time so that they will have experience at such time as they are ready to purchase a nuclear plant.

[821] I would point out that there is a licensing procedure to go through on a nuclear plant which involves the other side of the Commission, and that our responsibility under the Atomic Energy Commission is to only license plants that we feel are safe from a health and safety standpoint for the public, so to that extent the utility ought to start preparing at an early date and training people so that they will be equipped to purchase and operate a nuclear plant.

* * * *

[823] Q Well, what would you tell the executive who came to you at the present time and wanted some assurances that the nature and scope of the licensing requirements would not change in the near future?

A I would tell him that we could not guarantee that it would not, but that in general we don't see any major changes.

Q Would you point out to him any differences in the lead time necessary to build a nuclear plant?

A Yes. I would point out that it is estimated it would take from five to seven years to build a nuclear plant, whereas one would build a fossil plant normally possibly in four to five years.

THE COURT: Can you hear the witness, Mr. Hedlund?

MR. HEDLUND: Just barely, your Honor.

THE COURT: Would you speak up a little louder, please? We have noise out in the hall. This is moving day. They are moving a lot of furniture, and so on, into my chambers.

THE WITNESS: Surely.

BY MR. SIMS:

Q If the executive told you he had to get the electrical capacity on the line in about four years, would you recommend in that situation that he explore [824] nuclear?

A I would recommend that he discuss with the reactor manufacturers to see what kind of guarantee he could get from them. But in general four years is a pretty tight schedule to plan on a nuclear plant based on the experience to date.

* * * *

[827] BY MR. SIMS:

Q Would you recommend that an electric utility company be of any particular size and installed generating capacity before considering nuclear power, assuming that the electric utility was not in a position to sell substantial portions of the nuclear power to other electrical utilities?

A No, I would not, because I think the utilities have to understand their own system.

Let me say this: that I don't know of any case where a utility would come and ask me that. I would be surprised that they didn't know what kind of back-up capacity they needed. I have never been asked that, because the average utility knows his system pretty well. I don't think I would be as expert in their area as the utilities would, as to what his situation is.

Q Have any electric utility executives representing an electric utility system having about 1,000 megawatts or less come to you to discuss building a nuclear station?

A Yes. The Eugene Water & Electric Board has. Their largest generating plants—and this is a municipal, in Eugene, Oregon—the largest plant they have in their system is 150 megawatts. They purchase [828] probably another 500 megawatts from Bonneville Power. They have just obtained proposals for an 1100 megawatt plant from five reactor suppliers.

The only assumption one can make which they published was that they sell part of this power. There is an agreement in the Northwest between all the utilities as to who buys what and when and whose system.

The interties in this country has greatly changed this whole situation. So it is hard to say what utility will purchase what size plant any more. That is my experience in the last two years.

[829] Q Did you testify on direct that the nuclear plant had to be of a particular size before it was economic as contrasted to a fossil fuel plant?

A Yes. I said starting about 500 megawatts. Under that a nuclear plant generally is not competitive. There could be situations in extremes, like Hawaii, where there are no interties, where a smaller plant might be. But in general that is somewhere around the 500 megawatt size where it becomes competitive.

Q If a utility executive came to you, then, and told you they wanted to build something that was going to be less than 500 megawatts, would you suggest then that they consider seriously a nuclear power plant?

A I would suggest that they talk to the reactor manufacturers, because I would doubt whether they would be able to get a proposal for under 500 megawatts, although there is a plant, Port St. Germaine, which is a gas-cooled reactor, and that is 330 megawatts. That is being built more as a prototype demonstration plant. But Gulf General Atomics has said they would consider building a duplicate of that; but it would be pretty high-priced. Chances are a 500 megawatt plant might come in at about the same price, because the manufacturer, if he has to tool up separately, it is going to cost more.

[830] Q You don't think the manufacturers in the future will manufacture sizes of 500 megawatts or less?

A That is hard to tell. There are many parts—not many, but there are parts of the world where the demand might only be for a 200 or 300 megawatt plant. One of the problems has been in the American Public Power Association, which represents the municipals, they have complained to the AEC and have encouraged us to do more work in trying to develop a small plant that the municipals could use and that parts of the world where they have unusually high fuel costs could use.

But in general in the United States, the continental United States, there doesn't seem to be much of a market

where a small nuclear plant could be competitive.

[831] Q What size of plants, nuclear plants, would the municipal companies be interested in?

A They were interested in plants under 500 megawatts. But in the last two years, especially the last year, there has been a tendency for the municipals to pool together. This is what our Commission has encouraged the APPA to take a look at, that is, the municipals joining together so they can build a larger plant so that the economics favor the larger plant.

So if you build smaller, you are going to get more costly electricity.

Q The present licensing scheme under the Atomic Energy Act of 1954 provides for two classes of licensing for a nuclear power project, is this true?

MR. HEDLUND: I am going to object to this.

THE COURT: Have you finished the question?

MR. SIMS: Yes.

MR. HEDLUND: I believe the regulations speak for themselves.

MR. SIMS: This is a preliminary question.

THE COURT: It is a preliminary question; otherwise, the motion to strike will be considered.

Do you recall the question?

THE WITNESS: Would you repeat it, please?

* * * *

[857] RUEBEN THORSON,

called as a witness by and on behalf of the defendants herein, having been previously duly sworn, was examined and testified further as follows:

THE COURT: You may proceed.

MR. CUSACK: Thank you, your Honor.

CROSS EXAMINATION

BY MR. CUSACK:

* * * *

[865] Q Did you know, sir, whether or not the stock in United Electric owned by Investors Incorporated was acquired by the Crowns themselves?

A I do not know whether that was bought by the Crowns or by the Material Service Corporation. I think it was suggested that (we) bought it, and I just assumed that that was for the company.

Q But you didn't know?

A I did not know.

Q Mr. Thorson, on direct examination you testified at page 585 of the transcript that although your knowledge was "very slight" of the United Electric-Truax merger discussions, there was not much interest on the part of Truax "if I remember correctly."

Mr. Thorson, did you ever speak with anyone from Truax or with any representative of Truax in regard to this matter?

A Never. I didn't know anybody over there at that time. Years ago I knew Mr. Truax, but in recent years, no.

Q You mentioned, Mr. Thorson, that the Truax-United Electric merger discussions were discussed "very brief," at the United Electric Board meetings. Do you recall, sir, who brought up the matter at the Board [866] meetings?

A I don't know. I think it may have been Mr. Morris. Wait a minute. Was Mr. Kolbe there then? I think Mr. Kolbe remained on, if I recall. Was it two years after I came on the Board before he stepped aside? Was it a year or two?

Q Yes, sir.

A I can't tell you who brought it up, but the chairman may have brought it up. That's all I can say. I can't say for sure. I remember that the matter was brought up once or twice in a very casual way and there was a rather short discussion, because there didn't seem to be

any interest on the other side. That was the conclusion I drew. The thing sort of fell of its own weight. That is the impression I got. I never pursued the matter.

[867] Q Is this impression based on comments which were made at the Board of Directors meeting by other directors?

A Yes, that there seemed to be a lack of interest on the part of Truax.

Q And on this basis you obtained this impression that Truax had a lack of interest?

A That's correct. That was just a supposition on my part.

Q Did you ever discuss the possible Truax-United Electric merger with any of the Crowns?

A No.

Q Mr. Thorson, Harold K. Pedersen, treasurer of General Dynamics, whose deposition is in evidence, testified as follows—

MR. HEDLUND: One moment, Mr. Cusack, if I may. May we have an opportunity to get the transcript so that I may follow it?

MR. CUSACK: I will lend you mine. Well, no, I don't have it.

MR. HEDLUND: I am sorry for the interruption, your Honor.

THE COURT: It is all right.

* * * *

[890] BY THE WITNESS:

A I would say that normally the securities are fully paid for at the time when the tender offer is effective. Now, there may be other arrangements made that I'm not familiar with.

BY MR. CUSACK:

Q Thank you, sir.

Mr. Thorson, you testified at page 588 of the transcript that Freeman was:

(Reading) ". . . very familiar with the problems of deep mining and offered the services in every way

they could to be helpful to United Electric in that area".

You also testified on Thursday at page 589 of the transcript in regard to the Round Prairie field, that:

(Reading) "It was suggested obviously that if they went ahead with that, Freeman would be very helpful or perhaps would be very helpful in undertaking that project."

Do you recall the June 10, 1964, Board of Directors meeting of United Electric, which meeting you attended, according to the minutes, and at which meeting, according to page 4236 of the minutes the [891] directors present unanimously approved options to lease "covering approximately 1,610 acres in Round Prairie Field, Perry County, Illinois, containing an estimated 9,658,023 tons of coal"

A Lease to who?

Q A lease to United Electric, sir. Do you recall that incident, the acquisition of 9,658,000 tons of underground coal at Round Prairie in 1964, June 10—excuse me, January 10?

A I must be frank and say that there were so many parcels of acreage acquired here, there and everywhere, that I can't specifically—I know that they were interested in Round Prarie, but specifically I can't give you a definitive answer. I'm sorry I don't remember.

Q Perhaps I can shorten this up, sir.

You do recall a number of occasions when you were a director that United Electric did acquire underground acreage at Round Prairie do you not, sir?

A Yes, that's right.

Q Mr. Thorson, do you recall what the arrangements were, if any, whereby Freeman would be very helpful or perhaps would be very helpful in undertaking the mining of the Round Prairie Field?

[892] A No. Of course, I'm getting way over my depths as far as the coal business is concerned. My knowledge is very limited, indeed, and I hoped that this wouldn't get into that area, because I'm a novice.

I do know that—I've been told that Freeman had deep mining operations, that United Electric was a stripping operation, and that they tried deep mining once before and it wasn't successful, and I felt that they would lean heavily on the resources of knowledge and know-how that Freeman could help them with in this area, and that's just a generality, but that's the conclusion I reached.

Q Mr. Thorson, do you know, during the time you were on the Board of United Electric, whether the management of United Electric ever consulted with any other underground coal producer in regard to the Round Prairie Field?

A I don't know.

Q Mr. Thorson, was it not stated by the officers of United Electric at the Board meetings that United Electric itself planned to mine the Round Prairie Field?

A I don't recall that. I hate to be evasive, but I don't recall that. You mean alone, without the assistance of others?

[893] Q With perhaps using some other company's technical benefit being paid for by United Electric, but to mine it themselves?

A Well, I never drew the conclusion that deep mining in the Prairie Field was an imminent development. I sort of felt that was something for the future, correlated to the acquisition of other contiguous properties for another buyer, but if they decided to develop it, they would probably look to United Electric to develop the coal property, and this conglomerate referred to in the testimony.

Q But, was it not the intention when they had acquired additional reserves in that area that United Electric itself would undertake the mining of Round Prairie?

A I think perhaps that was the idea.

[894] Generally it was not thought by the directors that they would merely turn over a corporate opportunity in Round Prairie to Freeman?

A Oh, no, no, not in that sense. I think they were going to lean on them for some help that was offered by Mr. Nugent.

Q This help was to be reimbursed for, I assume?

A I presume so.

Q Mr. Thorson, do you recall a research bulletin of Paine, Webber, Jackson & Curtis of September 9, 1959 in regard to the coal industry in general and United Electric in particular?

A No, I don't as of today. I know we had one at that time. As of today, but I don't recall having read it in the past, and I didn't read it today for certain reasons.

MR. CUSACK: I would like the Reporter to mark for identification as Government Exhibit 109 Research Bulletin of Paine, Webber, Jackson & Curtis, Volume 23, No. 59, dated September 9, 1959.

(The document was thereupon marked as Government Exhibit 109 for identification.)

* * * *

[902] Q In regard to the Industry Field, Mr. Thorson, as you recall that is the strip coal acreage located in Schuyler-McDonough Counties?

A Yes.

Q Is it not a fact, sir, that it was stated at United Electric's Board meetings that United Electric would someday mine the Industry Field?

A That was the implication. That's the conclusion I drew, yes, but it was a backlog reserve, not foreseeable future, but some way down the road.

Q Yes, sir.

Mr. Thorson, you testified at pages 586 and 587 of your direct examination that United Electric had a strip coal reserve problem, although you stated that:

(Reading) "I am no expert in the coal business. I want to make that eminently clear. But these discussions came up, and the enlarging of the reserves was very difficult to achieve and they had real problems."

Sir, the information which you obtained in regard to United Electric's reserves was at the Board of Directors meetings of United Electric, is that correct, sir?

A That's correct.

[903] Q The information which you had in regard to United Electric's reserves was from the officers of the corporation in general and Mr. Nugent in particular, would that be fair to say?

A It was carried in the annual reports, and the auditors certified the reports, so I felt there was integrity in the estimates of the reserves.

Q Yes, I understand.

Is it not a fact, Mr. Thorson, that Mr. Nugent was primarily interested in acquiring strip reserves at United Electric's four operating mines?

A I think he was interested in acquiring strip reserves almost wherever they were available, even as far out west as Idaho or Nevada, wherever we acquired some reserves.

Q Did you ever visit any of the mines of United Electric, sir?

A I never visited a mine, I'm almost ashamed to say, but I never have.

THE COURT: It's not too late.

THE WITNESS: Someday I will have an opportunity, I hope.

[913]

IN THE UNITED STATES DISTRICT COURT
NORTHERN DISTRICT OF ILLIINOIS
EASTERN DIVISION

No. 67 C 1632

UNITED STATES OF AMERICA, PLAINTIFF

vs.

GENERAL DYNAMICS CORPORATION; THE UNITED ELECTRIC COAL COMPANIES; and FREEMAN COAL MINING CORPORATION, DEFENDANTS

Before the HON. EDWIN A. ROBSON, Judge,

Tuesday, April 7, 1970,

10:40 o'clock a.m.

PRESENT:

MR. JOHN THOMAS CUSACK,
MR. ROBERT L. EISEN,
MR. RONALD L. FUTTERMAN, and
MR. RICHARD J. BRAUN,
appeared for Plaintiff;

MR. REUBEN L. HEDLUND,
MR. DONALD G. KEMPF, JR., and
MR. RICHARD H. IRVING, III,
appeared for Defendants.

ALSO PRESENT:

MR. JAMES M. FOLSOM.

[930]

* * *

ROBERT W. STEELE,

called as a witness by the defendants, having been first duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. KEMPF:

Q Please state your name, sir.
A Robert W. Steele.
THE COURT: Will you spell your last name.
THE WITNESS: S-t-e-e-l-e.

BY MR. KEMPF:

Q What is your home address, Mr. Steele?
A 275 Southgate Drive, Dubuque, Iowa.
Q By whom are you employed, sir?
A I'm employed by Interstate Power Company, with general offices in Dubuque, Iowa.
Q What is your position with Interstate Power, Mr. Steele?
A I'm president of the company and chief operating officer, and I'm also a director of the company.
Q What is your business address in Dubuque?
A 1000 Main Street.
[931] Q Mr. Steele, when did you join Interstate Power Company?
A Nearly 30 years ago. I started with Interstate Power Company in 1941 as power sales engineer, and over the years have held various responsibilities in sales, in production department and on the corporate staff.
Q When did you become president of the company?
A I became president of the company on January 1, 1966.
Q As an executive with Interstate Power Company, have you played an active role in the company's plant construction and fuel procurement decisions?
A Yes, sir. I have been in the Engineering Department, I have worked in the Production Department, and over the years have participated in the decisions that have been affecting our company in regard to power

plant construction, substation construction, fuel procurement and the like.

Q Are you a professional registered engineer, sir?

A Yes, sir. I am registered in the state of Iowa.

Q Mr. Steele, could you describe for us [932] briefly the service areas served by Interstate Power Company?

A Yes, sir. We serve in north eastern Illinois, in northeastern Iowa, central Iowa and throughout the southernmost portion of the state of Minnesota.

Q I would now like to show you what has been received in evidence as Defendants' Exhibit 144, a map entitled "Investor-Owned Electric Utility Service Areas," and if you could step down and indicate on this map the specific service areas served by Interstate Power, I would appreciate it.

A The area served by Interstate Power Company is this blue area (indicating) in the general area I have just discussed, and it is labeled "63."

Q 63 identifies it as your service area?

A As Interstate Power Company.

Q What electrical generating facilities does Interstate Power Company operate, Mr. Steele?

A We have electric generating plants, three on the Mississippi. We have a large station at Clinton, Iowa, with gross capability of 256.5 megawatts; we have another plant located at Dubuque, Iowa, with a gross capability of 97 megawatts; we have another plant located at Lansing, Iowa, with a gross capability of [933] 65 megawatts. We have a plant at Mason City, Iowa, with a gross capacity of 27 megawatts; we have another plant at Albert Lea with 20.5 megawatts of capability; and, we have a plant at Fox Lake, which is near Sherborne Minnesota, with the capability of 114.5 megawatts.

[934] Q Your Lansing station, is that also on the Mississippi River?

A Yes, sir.

Q What is the fuel that is used by Interstate Power at its electrical generating stations?

A Well, we use a variety of fuels depending upon the time of the year, the plant, the various costs that are involved, so that we use various fuels throughout our entire system.

Q All right.

Turning to your three Mississippi River stations, what fuel do you use at your Clinton, Iowa facility?

A We use coal and gas, and the ratio there is about 80 percent coal, about 20 percent gas.

Q What fuels are you using at your Dubuque facility?

A There we're using coal and gas. This used to be predominantly a hundred percent coal plant, but in the last few years we have been burning approximately 50 percent coal and 50 percent gas, primarily because it is in a downtown metropolitan area, and air pollution is becoming a problem.

Q What about the Lansing facility?

[935] A The Lansing plant is predominantly—in fact, it's a hundred percent coal. We have not yet installed any gas capability at Lansing.

Q What fuel do you use at your Mason City plant?

A There we use a combination of gas and oil. We use approximately 80 percent gas and about 20 percent oil.

Q Do you have a coal capability at that plant?

A No, we do not. We used to have capability to burn coal, but it became uneconomical and we retired the coal facilities.

Q What about the Fox Lake facility in Minnesota?

A Fox Lake uses three fuels. It has gas, oil and coal. Approximately 23 percent of it is oil and 7 percent of it could be coal, and the balance in gas.

THE COURT: 7 percent or 70 percent?

THE WITNESS: 7 percent, sir.

THE COURT: 7 percent. All right.

BY MR. KEMPF:

Q Do you expect that you will continue to burn coal at that station?

A No, sir. While we do have the capability, the recently-enacted pollution criteria in the State of [936] Minnesota lead us to believe that rather than put in a million four hundred thousand dollar electronic or electrostatic precipitators, that we will probably change over to burning oil.

Q Finally, what fuels are used at your Albert Lea facility?

A There we use a combination of gas and oil. I believe there the breakdown is roughly perhaps 80 percent gas and 20 percent oil.

Q Are these various fuels, gas and oil and coal, in competition for the business of Interstate Power Company?

A Yes, there's a great competition for our fuel between not only the coal producers, but oil and gas, and, of course, there's always nuclear power that has to be factored into any generating that we're looking at today.

Q Where are the mines from which Interstate Power Company procures the coal which its Mississippi River facilities burn located?

A All of our coal that is burned in the Mississippi River plants comes from the Belleville District.

[937] Q Why is that?

A Well, the economics involved in the purchase of coal and the transportation to the destination at the power plant has to be considered as a whole, and these mines located near the Mississippi River, of course, have a short haul to the dock, and it has been economical for us to purchase our coal from this area.

Q You say they have a short haul to the Mississippi docks. Why is that?

A Well, this is short in comparison to other coal fields in the southern Illinois area.

Q What about design specifications? Are those a factor in your fuel purchasing decisions?

A Yes. As you know, a boiler is a very complicated piece of equipment, and the decision that must be made as to the design influences the cost of the eventual boiler, and we have designed our boilers to burn certain characteristic coals and this, of course, then leads us to the purchase of these coals over a long period of time to obtain the maximum efficiency of our boilers, and it has come about over the years that the Belleville district supplies us with the most economical coal.

Q Would you be able to burn coal from any midwest mines in your boilers?

[938] A No, we could not, because there are coals that have a different characteristic than what we would like to burn, and we have to keep at rather close tolerance on the coals that we purchase so as to not adversely affect our operating situation at our various power plants.

Q Could you give us some specific examples of situations where you would not be able to burn a particular type of coal?

A Well, we have designed our boilers for the purpose of burning wash coal, and so this would preclude some of the coals from being burned in our boilers, not to say that they couldn't be burned, but they would give us so much difficulty it would become a severe operating problem. Some of the fuels, the coals, have different fusion temperatures, and this, then, becomes a matter of operation.

Q Does Interstate Power buy any coal on the spot market?

A Almost none.

Q Why is that?

A Well, these power plants, of course, are heavy investments, and our requirement as a regulated industry to our customers requires that we maintain [939] adequate fuels and have the ability to purchase fuels over a long period of time to insure this reliability.

Q Of how long a duration are Interstate Power Company's coal supply contracts at the present time, Mr. Steele?

A Our present contracts are 10-year contracts. We have, of course, looked at these and would perhaps be interested in longer term contracts, maybe 15 to 20 years.

[940] Q Do you anticipate that trend toward these longer type contracts would continue in the future?

A Well, I am not too sure. A few years ago I would have said yes, but today, with nuclear fuel, with other problems that are facing utilities, I believe that we perhaps would be looking at shorter-term contracts.

Q Is Interstate Power presently operating any nuclear power generating stations?

A No, sir. We are not. We have participated in the research and development of the Pathfinder Plant that was built by Northern States Power Company. We have kept ourselves familiar with the technological advancement in the nuclear field, and each time we look at additions to our generating capability, of course, we would look at nuclear as a competitor along with the fossil fuel plants.

Q You also referred to other factors faced by a utility. Would one of those be air pollution?

A Certainly this is a situation that is coming to the front very rapidly, and utilities faced with prescribing to the regulatory criteria that are being issued state by state.

Q How would you characterize the degree of competition for the fuel and supply business of [941] Interstate Power at the present time, Mr. Steele?

A Well, the competition is there, because we have a number of coal suppliers who can supply us, and we also are being asked to use gas as a fuel more and more to combat air pollution. As I have indicated, we also look at oil, again because of the sulphur problem, and we also each time we view nuclear.

[942] Q What effect, if any, does the combined ownership of Freeman and United Electric by General Dynamics have on the competition for the fuel business of Interstate Power Company?

A I don't believe that this adversely affects Interstate Power Company, because we look at our supplier, United Electric, from whom we have been purchasing coal for over a quarter of a century, and I don't see any effect at all.

Q Do you see any adverse effect to your company if these two companies, United Electric and Freeman, were forced to operate independently?

A Yes, I do, because this has been of some concern to Interstate Power Company, and a number of years ago I reviewed with our operating people, our production people, the problem that we saw on the horizon, which was the diminishing reserves situation with United Electric, and this causes some concern as to what our future relationship would be with United.

Here is a situation where I think one compliments the other. Of course, reserves is a very critical part of the reliability factor for utilities in the years ahead.

MR. KEMPF: I have no further questions.

* * * *

[943] CROSS EXAMINATION

BY MR. BRAUN:

* * * *

[944] Q Can your burn any coal in your Kapp Station irrespective of its dust content?

A The answer to that, of course, is that you can attempt to burn anything that you can put into the boiler, but I must caution you that as a public utility we are charged with furnishing 100 percent continuity of service, and we cannot experiment with any and every type of coal. We know what our boilers were designed for. We know that we have to stay within a close tolerance. For us to jeopardize our reliability by taking any and all coals would not be wise.

Q Do you recall, Mr. Steele, filling out the Court's subpoena questionnaire with respect to the dust tolerance of your facilities at the Kapp Station?

A I recall looking at them and signing the letter that forwarded them in here, but it has been some time since I had seen these particular statistics that you refer to.

Q Do you recall specifying any dust content of the coal which can be burned at that facility?

A No, sir.

Q Is it not true that you can burn coal with sulphur content of less than 3.5 percent?

A You can burn coals that have varying amounts [945] of sulphur, yes.

* * * *

[951] Q With respect to your Dubuque station, Mr. Steele, what is the delivered price per million BTU's for coal?

A Well, again, you are testing my memory. As I pointed out, this information is in the subpoenaed documents. But I recall that our delivered fuel cost there is in the neighborhood of twenty-five, twenty-six cents a million BTU.

MR. BRAUN: Your Honor, may I confer with co-counsel for a moment? I do not believe this information is in the questionnaire.

THE COURT: You may.

(There was a short interruption, after which the following further proceedings were had herein, to-wit:)

MR. CUSACK: I would like to state for the benefit of the Court, your Honor, that the responses to the subpoena questionnaires are not in evidence, but in the light of comments made by counsel, we will put them in our rebuttal case. We also will put in a summary of the information contained therein.

MR. KEMPF: The original letter of last June by the Government indicated they were going to put these in. Besides, that, the parties have reached an agreement [952] that either party is free to use the subpoena answers.

THE COURT: Then it is not necessary, and the record may show that this witness has responded and that they are of record and that will cover it.

MR. CUSACK: Thank you, your Honor.

MR. BRAUN: May I confer with co-counsel again, your Honor?

THE COURT: Yes.

(There was a short interruption, after which the following further proceedings were had herein, to-wit.)

MR. BRAUN: I apologize for delaying you.

THE COURT: It is all right.

BY MR. BRAUN:

Q Mr. Steele, can you tell me in cents the delivered price per million BTU's of gas, firm rate gas, in Dubuque? That is, delivered to your Dubuque generating station.

A Well, we purchase no firm gas, so I cannot give you the price of firm gas.

Q Can you give me the price of firm gas in Clinton, Iowa, at your Kapp station?

A Well, there again we purchase no firm gas for our Clinton station.

* * * *

[956] Q Is it not a fact that the proposal they made to you in order to bring gas into your station at Lansing was uneconomical?

A I believe that when we analyzed the proposal, it would not be economical for Interstate to make the expenditure to add oil burning facilities to our plant and buy at that particular price.

Q You also considered the possibility of oil burning facilities at Lansing?

A Excuse me. I meant gas burning facilities.

Q Have you considered the possibility of using oil burning facilities at Lansing?

A We have always discussed every alternate fuel and looked at it, and we are doing so more in recent years because of air pollution.

Q And this alternate fuel oil was also rejected at Lansing as being uneconomical?

A I don't recall that we went through to the final determination on oil.

Q Is your Fox Lake station presently burning oil with a sulphur content of approximately 3 percent?

A Again I would have to say that I am not that familiar with the sulphur content of every oil that we purchased, but we are burning oil in our Fox Lake plant from time to time.

* * * *

[959] Q Now, you were asked on direct examination several questions about the Pathfinder Nuclear Plant. Do you know at the present time what fuel that plant is burning?

A Yes, sir. The present Pathfinder Plant, of course, has been discontinued as a nuclear reactor plant because it was not feasible, and it has been phased out with the approval of the Atomic Energy Commission, and the owner of the power plant, Northern States Power Company, has installed oil-burning steam generators to

take care of their steam requirements at this particular power plant.

Q I take it, then, that Interstate Power is no longer a participant in this experiment?

A That is correct. Our participation discontinued at the time the research and development came to an end.

Q Because of your experience with the Pathfinder Plant, you attempt, do you not, to keep yourself aware of the developments in the nuclear field?

A The answer is yes, and since that time of our discontinuance with the Pathfinder Plant, the Interstate Power Company has entered into a study with several other [960] utilities in the Midwest area with the consulting firm of Black & Veech from Kansas City to study the feasibility of a molten salt reactor.

Q Has any conclusion been reached with respect to the feasibility of that reactor at the present time?

A No, sir. At the present time they are just concluding phase 1 of the study and are preparing to enter into the phase 2 area.

Q Could Interstate Power Company alone consider building a nuclear plant, given its present size and kilowatt capacity?

A Well, when you say could we consider, certainly we could consider many alternatives for adding to our generation.

You have referred to our size. I think we have a capability as of last December in our system of some 590 megawatts. Our peak last summer was in the neighborhood of 411 megawatts. So, we have some reserve. Our next unit, as we forecasted in the five-year forecast, will probably be other than base loaded plants because of the situation of our particular system, but certainly in the years ahead when we envision the possibility of putting in another base loaded plant, we feel that we would have adequate size to finance and construct and operate a nuclear power plant.

[961] Q Do you have an opinion, Mr. Steele, with respect to how large in kilowatt capacity a nuclear plant would have to be in order to be competitive in any part of the system you serve?

A Are you talking as of today?

Q As of today.

A As of today, of course, conditions have changed very rapidly with the cost of nuclear power plants, and like everything else, all power plant costs have gone up. At the present time, with the high cost of money, the fact that nuclear power in its total cost, because of the high fixed charges involved and the fact that we are situated on the Mississippi River with power plants that are available to reach the more economical coal fields in Illinois, I doubt that we could justify at the present time building a nuclear power plant.

Q Thank you, Mr. Steele.

At some point in the future, Mr. Steele, how large a plant would you have to build in order to compete economically with any other fuel in any part of your generating area?

A Well, that question is a little difficult to answer because the factors all change, and at the [962] present time a nuclear power plant in our particular area has been described by certain more technical experts than myself that you would perhaps have to build an 800 megawatt unit to reach the economical points.

Now, as to the future, whether the conditions will remain the same, the cost of money, various factors that are involved in the total over-all concept, I wouldn't be able to answer a positive statement.

Q Mr. Steele, has your company made studies or projections of the peak kilowatt demand which Interstate Power Company will face over the next 10 years?

A I don't think we've gone 10 years, but we do forecast 5, 6 and 7 years in advance and, of course, we are updating these each time we reach a new peak, and the answer is yes, we have forecast what our requirements would be for a number of years ahead.

Q With respect to your projection of five or six years hence, do you project that your peak load will have reached 1200 megawatts by that time?

A No, sir, not in that period of time. As you know, the electric utility industry has had a past performance of doubling about every ten years, and this has been true with Interstate, so if we are at 600 or [963] close to

600 megawatts of capability, it will be perhaps ten years into the future before we would reach the 1200 megawatt figure that you have just mentioned.

Q In the meantime, Mr. Steele, is it true that you will rely on coal to generate a good portion of your electric generating requirements?

A Well, I would say that we would certainly rely to a great extent on coal for our power plants, based again on the competitiveness of the fuel, and in comparison with the studies that we make as versus the cost of gas and oil, and we are always studying the possibility of buying or owning jointly power plants with our neighbors whom we are interconnected with.

Q Mr. Steele, has Northern States Power Company—

MR. BRAUN: I will withdraw that, your Honor.

BY MR. BRAUN:

Q Mr. Steele, did you last renegotiate your coal contracts in 1966?

A I believe it was 1965, 1966 period.

Q How many different companies, coal companies, did you contact with respect to that renegotiation?

A Oh, we contacted a number. As to the exact number, I can't recall, but I know that we contacted [964] at least five or six companies and visited with them.

* * * *

[969] Q You decided then to add a fourth supplier sometime between 1965 and 1966?

A Yes, sir, we did, and I might say that primarily it was based upon our concern for the reserves that United Electric were indicating to us.

Q Did United Electric make their back-up reserves of Freeman available to you?

A I can't recall that this was ever stipulated.

Q So that there was no willingness that you know of on the part of United Electric to make Freeman's reserves available as a back-up?

MR. KEMPF: Your Honor, I am going to object. That is the same question he just asked and the witness just answered.

THE COURT: He may answer. Let's proceed.

BY THE WITNESS:

A Repeat the question, please.

THE COURT: Read the question.

(Question was read by the reporter.)

BY THE WITNESS:

A Is that the question you wish answered?

BY MR. BRAUN:

Q Yes, sir.

A I don't recall that this was a part of it. It may have been. As I say, some of the conversations [970] that they conducted with Mr. Carlson were, of course, never fully related to me.

• • • •

[984] Q Prior to 1965 would Interstate Power Company have purchased coal on its lowest delivered BTU basis?

A We always have tried to purchase coal on the lowest delivered possible basis consistent with deliverability and facilities that we have to handle it. There are many factors involved, not just straight price.

Q Prior to 1965, Mr. Steele, has the Interstate Power Company ever purchased coal from the Freeman Coal Mining Corporation?

A I can't recall that we did, but this is a period of time, and my memory may fail me. I know that these people have called on us in the times past. I think you asked that question when you were in my office, and we researched it, and I think we showed you some cards from the Freeman Coal Company salesmen who stopped in our office.

Q Did you not also inform me at that time that you had indeed purchased from Freeman Coal Mining Corporation?

A We may have purchased some small tonnage, but not anything larger or of consequence to our total requirements.

• • • •

[987] BY MR. BRAUN:

Q And the additional statement at page 205, where Mr. Hedlund asked Mr. Morris on direct:

> "Q Would you tell us what responsibilities after 1959 in your role as president you had with respect to the contracts of United Electric Coal Companies?
>
> "A Reports were made to me on all of the activities of our sales department as to what they were doing, and where, and I still had over-all supervision over sales as president, and the vice president of sales reported to me and kept me informed as to what was going on after I became president. I personally took part in discussions with some of our major customers, [988] particularly Union Electric, Northern States Power, Interstate Power and Central Illinois Light."

Were you aware of that testimony when you answered that question with respect to adverse effect on your company, when Mr. Kempf put that question to you on direct?

A No, sir, I have not seen any of the testimony in this particular case.

Q If Mr. Morris, in discussing the contract prices with the Freeman Coal Mining Corporation—if this resulted in an increased price, assuming that it resulted in an increased price to Interstate Power Company, would this have an adverse effect upon Interstate Power Company?

A Well, any increase in price from any of our suppliers would cause us to reanalyze our entire situation and our purchase requirements. As to the amounts of the increase, what the outcome would be would be difficult to speculate on.

Q Does Interstate Power Company consider that price competition is of benefit to it?

A Well, I would say that all competition as it affects the prices of the various fuels would be [989] beneficial if it has a tendency to lower the delivered cost of the fuel to us, no matter what the fuel is.

Q Does Interstate Power Company believe that a discussion of prices between two of its suppliers is likely to be of benefit to Interstate Power Company?

A I am sorry, but I don't think I have the ability to answer that question. It calls for speculation on my part.

• • • •

[993] Q Are you at all concerned, Mr. Steele, about [994] the extent of the total coal reserves, that is, mineable coal reserves, available to Interstate Power Company in Illinois? Are you at all concerned about running out of those reserves?

A Well, I am sure that we are concerned about mineable reserves, and the best information I have is that there are a lot of reserves still available for mining. What the economic factors will be at the time these reserves are opened up, I don't know. But certainly we are concerned about reserves. But we are looking more to the West for coal as well as to Illinois, primarily because of air pollution.

Q Mr. Steele, would it be more economical to use pollution control equipment on your Mississippi plants as opposed to bringing in coal from the West?

A Well, at the present time we have a very expensive electronic precipitator on our new plant at Clinton, Iowa, which we installed and made the commitment for years before air pollution became a headline item. Prior to that we had made an expenditure as a company for mechanical precipitators at our Dubuque Plant. So we already have expended money to control air pollution. We have quite an air pollution control program within our company. The burning of additional gas as we can [995] obtain it is a part of this.

• • • •

[996] Q Would that be more true if some of the reserves were located in the Belleville district?

A I would have to agree that if this was in the Belleville district and we were depending on this particular coal company and were buying coal at the particular time and our long-term requirements were such

that it would mean we would have to develop additional reserves, why, yes.

Q Did you come here today under subpoena, Mr. Steele?

A No, sir.

Q You came here voluntarily?

A That is right.

MR. BRAUN: I have no further questions.

MR. CUSACK: Excuse me, your Honor. May I confer with Mr. Braun?

THE COURT: You may. Let's proceed.

(There was a short interruption, after which the following further proceedings were had herein, to-wit:)

MR. CUSACK: Just three more questions, your Honor.

THE COURT: All right.

BY MR. BRAUN:

Q Mr. Steele, what information do you have with [997] respect to the coal reserves of United Electric?

A I don't have any specific tonnage at the present time, but I know that in our analysis of our coal requirements and in our discussions with United Electric personnel and in our meetings with other companies and with other electric utility companies, in talking to their personnel, we formed a judgment that there was a reserve problem, and back at the time that we were negotiating these new contracts, we so talked to United Electric about this particular problem.

Q So is it fair to say, Mr. Steele, that a good deal of your source of information about United Electric's reserve situation comes, in fact, from United Electric?

A I can't tell you just what it is percentagewise, but it is a matter of numerous discussions with a number of people, and as to what the percentage was, I would be unable to give you a qualified amount.

Q And is it fair to say, Mr. Steele, that you did not learn from the number of people to whom you talked about the existence of United Electric's deep coal reserves and Round Prairie Field or Beaucoup Field?

A As I said before, in my discussion here today in response to your questions, this may have been covered [998] with some of our personnel, but not with me.

• • • •

REDIRECT EXAMINATION

BY MR. KEMPF:

• • • •

Q You also discussed the fact that you were a member of a pool and were interconnected with other companies.

Were the decision made to install a nuclear facility within your system, would it be your expectation that a portion of the generation of that facility and in particular that portion which exceeded your own demand would be sold to your interconnecting pool members?

[999] A It could be handled that way, either sold on a firm basis for a period of years, or there are presently plants being built in joint ownership where each participant owns a portion of the unit.

Q Questions were asked of you concerning the Freeman and United Electric affiliation. When and how did you learn of this affiliation?

A As I recall, we were visited by United Electric people maybe 10 years ago and advised of what was taking place with United Electric.

[1000] Q This is in regard to its affiliation with Freeman?

A Yes.

Q You were asked whether it made any difference to you whether coal came from deep mines or strip mines from the Belleville District. My question is assuming that United Electric were not affiliated with Freeman and did not have the access to Freeman's deep mining technology and experience; under that assumption, suppose that United Electric were to come in to you as a utility executive and offer to sell you coal from a deep mine, notwithstanding the fact that they have no deep mine experience, what would your reaction be?

A Well, as I have testified, we always have felt or thought of United Electric as a strip mine company, not having any prior experience with deep mining, I would say that we would be hesitant about entering any commitment for coal from an unknown source, so to speak.

Q Your Savanna Station, which you discussed, is that operated at the present time?

A No, sir. This is retired in November of last year.

Q Would it be possible to truck coal into your [1001] Clinton Station from the mines that used to serve the Savanna facility?

A Yes. It would be possible to truck it, but the quantities that we require, the tonnages in this particular plant, far outstrip the ability to transport coal by truck economically.

Q During your period of acquaintanceship with the company's coal buying, have you ever experienced any price increases from The United Electric Coal Companies that would give any indication that there was improper conduct in terms of the relationship between that company and Freeman Coal Mining Corporation?

A No, sir. We have always dealt with United Electric and our other coal suppliers, I would say, and we have attempted to bring the price together if there was any variance at all.

Q Do you consider your Mississippi River facilities to be in the natural area to be served by mines in the Belleville District?

A Yes, I do, because of the close haul or short haul from the mines to the docks on the Mississippi and the fact that it can be barged up the river.

Q You indicated during your cross examination that you are a distributor of both gas and electricity. [1002] Do employees of Interstate Power Company actively attempt to convert industrial and home consumers of coal who are consuming only coal at their facilities to the use of natural gas instead of coal?

A Yes, sir. We have engineers who are actively seeking out the possibility of converting customers from other fuels to our gas supply.

1003] Q To the extent they are successful, the facilities in question consume less coal than they formerly did, is that correct?

A Yes. If they converted to gas.

Q Do you have any major customers who have made such conversions?

A Yes, we have. We have one of our ten largest customers, the Northwestern Portland Cement Company, at Mason City, that has phased out its own generation and the purchase of coal and is now taking its electrical requirements all from us rather than generating its requirements.

Q Did you indicate the name of the company?

A Northwestern States Cement.

Q You mentioned the possibility of burning more western coal in the future. What is the sulphur content of western coal? Is that low sulphur or high sulphur coal?

A It is lower than the coals we are purchasing at the present time, and I believe these coals are in the neighborhood of 1.5 percent sulphur.

Q Have you actually undertaken to begin investigation of this?

A Oh, yes, we have discussed this a number of times with companies.

* * * *

AFTERNOON SESSION—3:15 P.M.

* * * *

[1010] THE COURT: Are you ready to proceed?

MR. HEDLUND: Yes, your Honor.

THE COURT: Are there any matters to take up with the Court?

MR. HEDLUND: May we be off the record, please?

THE COURT: We may.

(Discussion held off the record.)

THE COURT: Back on the record.

MR. IRVING: The defendants at this time will call Mr. Thomas Latimer to the stand.

(Witness duly sworn.)

THOMAS H. LATIMER,

called as a witness by the defendants, having been first duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. IRVING:

Q For the record, would you please state your full name.
A Thomas H. Latimer.
Q Mr. Latimer, what is your current home address?
A 111 West Prairie Avenue, Wheaton, Illinois.
Q By whom are you employed, sir?
A The United Electric Coal Companies.
[1011] Q What is your business address?
A 307 North Michigan, Chicago.
Q What is your current position with UEC?
A Manager of Lands.

MR. IRVING: I ask the reporter to mark for identification as Defendants' Exhibit 60-D a four-page document entitled "United Electric Coal Companies—Possible Reserve Acquisitions at Existing Mines," and I hand it to the witness.

(The said document was marked Defendants' Exhibit 60-D for identification.)

[1012] BY MR. IRVING:

Q Mr. Latimer, do you recognize this document?
A Yes.
Q Have I correctly described it?
A Yes.
Q Were the figures and information set forth in DX-60-D compiled and prepared by you, sir?
A Yes.
Q Mr. Latimer, what does this exhibit purport to show?
A It shows the remaining reserves and the potential acquisitions of reserves at our operating mines and the North Canton Field, which was combined with the Buckheart Mine.

Q Mr. Latimer, what procedure did you use in compiling the information set forth in this exhibit?

A Personal knowledge of the fields; the result of our drill records; investigation of old mine maps, geological reports, and so forth; drilling that has been done in the last year; drilling off these properties that have been mentioned.

Q What expertise or special knowledge do you have which qualified you to prepare this exhibit, sir?

A Well, I have been investigating coal —— [1013] for a great many years, I believe since about 1939. I have investigated coal fields in, I believe, 12 states, and one province in Canada. I am thoroughly familiar with all of these properties of ours. I am minutely familiar with them, their ownership, the coal information available on them, and I think about everything there is know about them.

[1014] Q What first-hand knowledge, if any, have you had with respect to the facts set forth in this exhibit?

A I have quite complete first-hand knowledge of all of them.

Q Sir, what sources have you consulted in evaluating these properties?

A The sources that I mentioned, geological surveys, the mine maps, personal observation, outcrops results of our drill records on adjoining properties and nearby.

Q Sir, by "personal observation," does that include a physical examination of the tracts mentioned?

A Yes.

Q Pardon me?

A Yes.

Q Mr. Latimer, in what sense have you used the word "possible" in these charts?

A I believe they are available for sale to us and they, I know, contain some coal.

MR. IRVING: Your Honor, at this time defendants have no further questions.

THE COURT: All right. Are you offering the document?

MR. IRVING: Yes, we would at this time offer 60-D into evidence.

* * * *

[1016] CROSS EXAMINATION

BY MR. SIMS:

* * * *

[1017] Q Mr. Latimer, do you recall making an estimate of the coal owned or available to UEC at their Banner Mine around 1956 to 1957?

A I don't think I remember preparing one at that time. I may very well have.

MR. SIMS: Your Honor, may I approach the witness?

THE COURT: You may.

MR. SIMS: Would the Reporter mark as Government Exhibit GX-119 the document entitled "Estimates for Proposed Acquisition and Operation of the Banner Property", dated January 10, 1957.

(The document was thereupon marked as Government Exhibit No. GX-119 for identification.)

BY MR. SIMS:

Q Mr. Latimer, I hand you what has been marked GX-119. Would you refer to the third page of this document entitled "Introduction", the second paragraph, which reads:

(Reading.) "The reserves owned and available on the Banner property according to Mr. T. H. Latimer's estimate are as follows:

[1018] "Owned or controlled by United, 3,180,000 tons; available on adjacent lands, 3,320,000 tons; to be acquired from Kingston River Terminal, 1,300,000 tons. Estimated total, 7,800,000 tons."

Mr. Latimer, does this refresh your recollection of any estimates you made?

A Excuse me, sir. I've lost it. I thought you said page 3.

Q The page really is not numbered. Sheet 3.

A Sheet 3?

[1019] Q Under the introduction of the second paragraph.

A I did not write this report.

Q Well, it does refresh your recollection as to the estimate, does it?

A That estimate is probably undoubtedly made by me.

Q Do you have any idea approximately how many tons of coal had been mined at the Banner mine to date?

A I would have to refer to the record.

MR. IRVING: That is a matter of record in this case, your Honor. The production figures for these mines is in evidence, and they would be the best record of this sort of information.

THE COURT: Is this a foundation question?

MR. SIMS: Yes, your Honor.

THE COURT: It is a foundation question. He may answer.

BY MR. SIMS:

Q Do you have an estimate of approximately the tonnage mined at the Banner mine to date?

A I think I would have to refer to the record.

* * * *

[1032] BY MR. SIMS:

Q I think you testified in your deposition, Mr. Latimer, that you were not sure what drill holes had been placed in this property but that the overburden was too high at the time and UEC dropped this property or the options in this property, is this correct?

A I can't remember all of the drill holes, but the overburden was not only too high, but there were other troubles with it, too.

Q Pardon?

A There were other troubles with the field.

Q What were the other problems with the field?

A One problem was that the rock overburden was so high it would be impossible to work a wheel excavator in there. The average overburden was nearly a hundred feet. We found that the mine, although there were no maps to show it, the center of the hill had been mined completely through from crop to crop, and there was probably less than 3 million tons in the field.

[1033] Q You stated during your deposition, Mr. Latimer, that you were not real sure how many tons were remaining in the field. Have you done any work in that area since the time of the deposition that was in December, 1968?

A In the King Hill area?

Q Yes, sir.

A An estimate could be easily prepared in our office.

Q Approximately how many drill holes did you put down in the area?

A I don't remember.

Q Are you in a position at the present time, Mr. Latimer, to say that this area will not be mined by UEC economically in five years?

A In five years?

Q Yes.

A I don't see how it could be.

Q Of course, you would not know what economic conditions would prevail in the coal industry in five years, would you?

A We have no equipment in the vicinity capable of mining it.

Q You, of course, can, however, purchase equip-
[1034] ment that will mine a hundred feet of overburden, can you not?

A Not to mine three million tons, or less.

Q If you had other tonnage available to you, Mr. Latimer, would you consider in five years mining this property?

A That's a matter of conjecture.

MR. SIMS: Would the reporter mark as Government Exhibit 122 a document from R. H. Inman to R. J. Hepburn entitled "No. 2 Coal South of Illinois River" dated August 5, 1959.

(The document was thereupon marked as Government's Exhibit 122 for identification.)

THE COURT: Do you have a copy of that for the Court, Mr. Sims?

MR. SIMS: Yes.

• • • •

[1041] BY MR. SIMS:

Q Would you also draw on that map the approximate location of UEC's Gayle Field?

A (Drawing)

Q Are you finished?

A Yes.

Q Approximately how far is the Gayle Field from the Fidelity mine?

A From which part of the Fidelity mine?

Q The closest point to the Gayle Field?

A Oh, perhaps two miles.

Q Do you know at the present time that the Gayle Field will not be mined when the Fidelity reserves are exhausted?

A No, I do not know.

Q Is it your belief that it will be mined?

A I think it a little doubtful.

Q Approximately how many reserves are estimated in this field?

A I will have to refer to the record.

Q You have no approximate estimate?

A No, I don't remember.

MR. IRVING: Your Honor, I might point out this information is in the record in the case.

[1042] THE COURT: Mr. Sims, if it is a matter of record, there is no reason you can't ask a leading question: "Is there approximately so many tons?"

BY MR. SIMS:

Q Mr. Latimer, is there approximately 1,000,500 tons of coal in the Gayle Fields?

A Whatever the record shows.

THE COURT: The reporter would like to know whether you meant what you said. I have that you said 1,000,500 tons. Is it 1,000,500 tons or 1,500,000 tons?

MR. SIMS: 1,500,000 tons.

Would the reporter mark for identification Government's Exhibit 124, please. This is a letter from T. H. Latimer to George Heap, which was identified in Mr. Latimer's deposition as Latimer Deposition Exhibit 30.

(The document was thereupon marked as Government's Exhibit 124 for identification.)

BY MR. SIMS:

Q Mr. Latimer, would you look at this document?

MR. IRVING: Your Honor, may I please have a more accurate description of the document? I was not able to hear Mr. Sims.

THE COURT: Read the description.

(Record read by the reporter.)

• • • •

[1066]

IN THE UNITED STATES DISTRICT COURT
NORTHERN DISTRICT OF ILLINOIS
EASTERN DIVISION

No. 67 C 1632

UNITED STATES OF AMERICA, PLAINTIFF

vs.

GENERAL DYNAMICS CORPORATION; THE UNITED ELECTRIC COAL COMPANIES; and FREEMAN COAL MINING CORPORATION, DEFENDANTS

Before the HON. EDWIN A. ROBSON, Judge,

Wednesday, April 8, 1970,

10:30 o'clock a.m.

PRESENT:

MR. JOHN THOMAS CUSACK,
MR. ROBERT L. EISEN,
MR. RONALD L. FUTTERMAN,
MR. HUGO SIMS, and
MR. RICHARD J. BRAUN,

appeared for Plaintiff;

MR. REUBEN L. HEDLUND,
MR. DONALD G. KEMPF, JR., and
MR. RICHARD H. IRVING, III,

appeared for Defendants.

ALSO PRESENT:

MR. JAMES FOLSOM

• • • •

[1070] E. C. HILL,

called as a witness by the defendants herein, having been first duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. HEDLUND:

Q Would you would please state your name and present occupation?

A My name is E. C. Hill. I'm presently president of HILCO, Corporation. It's a coal brokerage firm with offices in Chattanooga, Tennessee.

Q Are you a resident of Chattanooga, Tennessee?

A Yes, I am.

Q Mr. Hill, were you formerly employed by the Tennessee Valley Authority?

A Yes, sir, I was.

Q Beginning in what year?

A I joined TVA in 1951.

Q Approximately how long were you with TVA?

A A little over 17½ years.

Q Would you please briefly describe the positions that you held with TVA and your responsibilities during [1071] the course of that 17 years.

A When I joined TVA in 1951 I was employed as a general buyer, buying primarily fuels, lubricants, fuels such as gasoline, diesel fuel, oils, greases, welding equipment, supplies and that nature, and after about eight months of employment I moved into the field of coal buying for TVA. I was a general buyer for them in the beginning. The latter part of 1951 I moved up to additional responsible jobs in the coal buying end of it, and in 1954 I was made assistant chief of the coal procurement branch. In 1956, I was made chief of the coal procurement branch. I held that position until 1966, when we took on nuclear fuel buying, and the position's title was changed to fuels procurement, which included coal and nuclear fuel.

Q Mr. Hill, the Tennessee Valley Authority is an instrumentality of the Federal Government, is that correct?

A Yes, it is.

Q It is not an investor-owned utility?

A No.

Q Mr. Hill, I direct your attention to what has been received in evidence as Defendants' Exhibit 144, which is a map of industrial-owned electric utility [1072] service areas, and I wonder if you could indicate on the map generally the geographic confines of the services areas of TVA?

THE COURT: You may step down, if you desire.

THE WITNESS: Yes.

MR. HEDLUND: Your Honor, I am not sure you have a copy of the map. Here is one.

THE COURT: I can recall it. Give me the number of the district. I looked at it—

MR. HEDLUND: It is not numbered, your Honor.

THE COURT: Oh, it is not numbered. All right.

MR. HEDLUND: Well, I will ask the witness to describe it.

BY THE WITNESS:

A This area which encompasses the State of Tennessee is the base operating area of TVA. TVA does cover certain segments of Kentucky, down into Alabama, certain segments of Mississippi, over into Georgia, North Carolina and Virginia.

[1073] BY MR. HEDLUND:

Q Generally is its service area within this blank white area in the states that you mentioned?

A Yes, it is.

THE COURT: May I inquire, does it extend over into Missouri, that white area?

THE WITNESS: No, sir, it does not go that far.

THE COURT: It does not. All right.

BY MR. HEDLUND:

Q Mr. Hill, would you please describe briefly the generating, electrical generating facilities and plants of TVA.

A Well, TVA is a government agency created in 1933 by an act of the Congress of the United States. It initially was primarily a hydrogenerating entity. Well, it was created to develop the Tennessee River, to eliminate floods, create navigation on the Tennessee River, and to also provide power to the area in which it was located. Initially it was made up primarily of hydrogenerating facilities, but as the load growth increased, hydro capacity was not adequate to fill the needs, so TVA went more into the field of steam generation, and in the early 50's, late 40's, TVA made a [1074] rather substantial move in the steam generating field and built a large number of coal-fired steam electric plants.

Q Could you tell me at the time that you left TVA the numbers and types of generating stations which it had on line at that time. Let me start first by asking how many hydroelectric generating facilities TVA had in approximately 1968.

A TVA had approximately 40 hydrogenerating facilities at that stage. It had 10, as I recall, coal-fired steam electric plants.

Q Stopping for a moment on the coal-fired plants, could you briefly describe the location and the size of the principal coal-fired generating stations of TVA.

A The coal-fired stations represent about 14,000,000 kilowatts capacity in the TVA system, with hydro capacity amounting to about 4,000,000 kw. The coal-fired plants are built—two plants are located in the West Kentucky coal field. Others are located in Tennessee and Alabama.

Q What are the names of the two principal facilities located in the West Kentucky coal field?

A The Shawnee plant located near Paducah, [1075] Kentucky, is a 10-unit facility, each with a rating of 150,000 kw. The other plant, the Paradise plant, is located near Central City, Kentucky. It presently has three generating units. Two of them are rated at 715,000 kilowatts each. The third, which has only recently been placed on line, is a 1150 megawatt, or 1,150,000 kw. unit.

Q As of 1968 did TVA have either an order or under construction or in planning any nuclear fuel generating units?

A Yes, it did. TVA entered the nuclear power generating field in the fall of 1966. At that time we placed orders for two boiling water reactors to be built by General Electric Company and we added a third unit boiling water reactor from GE to the plant. This plant, the first nuclear plant, is known as the Brown's Ferry plant near Decatur, Alabama. These three units are rated at about 1100 megawatts each, and then in the—

Q Excuse me for interrupting. That would then be at Brown's Ferry a total of 3300 megawatts of generating capability?

A Approximately, that is correct.

Then the second plant, nuclear plant, which TVA has on order is named the Sequoia plant, which is [1076] just north of Chattanooga, Tennessee. It consists of, or will consist of, two units that will be supplied by Westinghouse Electric Company, their pressurized water reactors. The ratings on these units are approximately 1150 megawatts each. This plant is not yet under construction. Contracts were made while I was still with the TVA for the supply of the equipment and the initial fuel supply, but AEC has not yet granted a construction permit for that plant.

[1077] Q When the Sequoia Plant is finished, and you mentioned that there is another coal-fired plant under construction by TVA, can you give me some idea of the breakdown between coal and nuclear in terms of the percentage of generating capacity that will be coal and the percentage that will be nuclear?

A TVA presently has about 15 million. There has been an addition to the TVA system coal-fired units since I left in August of 1968. They added this third unit at Paradise which is a 1,150 megawatt unit. So, roughly, they have 15 million kilowatts capacity in coal-fired units at this stage.

They have also since I left entered into a contract—well, I will back up.

We made this contract for an additional coal-fired plant while I was still with TVA. This was for two 1,300-megawatt units to be located at a site about 50 miles west of Nashville, Tennessee, on the Cumberland

River. The plant will be called the Cumberland Plant. These two units will add 2,600 megawatts of additional capacity, making about 17,500 megawatts of coal-fired capacity and about 5,600 megawatts of nuclear capacity.

Q I believe you mentioned it before, but what [1078] will the total capacity be with respect to hydroelectric?

A About 4 million. There is little likelihood of much addition of hydro capacity except for a peaking plant that TVA has recently announced. They announced a Rocky Mountain Plant, they call it, which is going to be a pump storage facility. It will have a capacity, as I recall, of about 1,400 megawatts. It will add to the present hydro system or is a more or less conventional hydro system. This will be the first entry into the pump storage type facility for TVA.

MR. HEDLUND: May I approach the witness, your Honor?

THE COURT: You may.

BY MR. HEDLUND:

Q Mr. Hill, I hand you what has been received in evidence as Defendants' Exhibit 103 which is a document entitled "Comparison of Coal-Fired and Nuclear-Powered Plants for the TVA System" which carries a date on the second page of June 1966.

Can you tell me briefly the circumstances under which this was prepared or why it was prepared?

A This report was prepared because of TVA's entry into the nuclear-powered generating field. It was a new field for TVA.

[1079] Because of the size of the units that TVA was contracting for, nuclear units, we felt that the nation as a whole needed some explanation for this particular move on the part of TVA. So, this report was prepared by a number of people in TVA with this primary objective in mind, to give a good explanation for the TVA supply area as well as the nation as a whole for TVA going into the nuclear power generating field.

Q I direct your attention, sir, to page 15 of that document.

A Yes.

Q Under "Conclusions," the first sentence reads as follows:

> "It is evident from the results of the evaluation that the nuclear alternatives have a decided advantage over the coal-fired plant, and that either a BWR or a PWR nuclear plant at Brown's Ferry would be a decided economic choice over a coal-fired plant at Cumberland City."

Do you know, Mr. Hill, whether at the time this was prepared that that was a true and accurate statement?
[1080] A That was a true and accurate statement at the time that this was prepared.

Q There is, is there not, coal mining in substantial sections of the state of Kentucky and of Tennessee?

A Yes, there is. In west Kentucky as well as east Kentucky, coal is produced. Coal is produced in east Tennessee. There is no coal produced in west Tennessee.

Q Is there coal presently being produced, if you know, in the state of Alabama?

A Yes, there is.

MR. HEDLUND: May I approach the witness, your Honor?

THE COURT: Yes.

BY MR. HEDLUND:

Q Mr. Hill, I hand you what has been received in evidence as Defendants' Exhibit 116 which is a document published by the United States Atomic Energy Commission, Division of Technical Information, and it is entitled "Nuclear Power Briefing for the Coal Industry, September 29-30, 1966, Oak Ridge, Tennessee."

Mr. Hill, did TVA participate in this nuclear power briefing?

[1081] A One of TVA's officials did appear on the program in this briefing, yes.

Q Were you present at this briefing?

A Yes, I was.

Q I would like to direct your attention, if I may, to page 192 of this document where the following is stated in part, beginning in the middle of the page.

By the way, just for the record, this page 192 is part, is it not, of a presentation made by G. O. Wessenauer, Manager of Power of the Tennessee Valley Authority, is that correct?

A That is correct.

Q Returning to page 192, the following is stated:

> "Today nuclear power offers an alternative to coal-fired thermal plants and portends to be an even stronger competitor for meeting future needs. We expect that coal will leave no economic stone unturned in meeting that challenge. TVA will continue as in the past to evaluate and to compare before deciding on future plants. With those of you who produce coal and those who transport it, TVA has a mutual interest. It is to keep the delivered cost of coal competitive."

[1082] Sir, I ask you whether you agree or disagree with the statements that I have just read?

A Yes, I agree with the statement that was made by Mr. Wessenauer.

[1083] Q Mr. Hill, in your opinion, does coal compete with nuclear energy, gas, oil and hydroelectric power for the energy business of TVA?

A Yes, it does.

Q Approximately how many tons of coal does TVA presently consume or did it burn in 1968, your last year with them?

A Slightly over 28 million tons in 1968.

Q How would that rank TVA in terms of coal-burning utilities across the country?

A Well, TVA is and has been for some time the largest coal-burning utility in the United States.

Q Are you aware of the affiliation of the Freeman Coal Mining Corporation and The United Electric Coal Companies?

A Yes, I am.

Q When did you first become aware of this?

A Well, the formal affiliation as I recall took place in the late 50's, about 1959, but there had been an affilia-

tion of sorts, according to the information that had come to me, even in years earlier than 1959.

Q What was that information?

A Well, I had bought coal in my position with TVA from both the Freeman Coal Mining Corporation and The [1084] United Electric Companies for several years. I had what I feel were good relations with the officers of those companies. We discussed their various activities on a number of occasions. I was informed by some of the officers of the company of the association between the two companies.

Q This was prior to 1959?

A Yes, that is correct.

Q In that time prior to 1960 which you have just referred to, did United Electric operate a mine in West Kentucky?

A Yes, they did, the Buffalo Creek Mine.

Q Do you recall also whether or not they had a sales agency relationship with another mine in west Kentucky?

A Yes, they did. They had a sales agency relation with a company, Ruby Chandler Jordan, as I recall.

Q Mr. Hill, I hand you what has been received in evidence as Defendants' Exhibit 104 which is a letter from you to Bart, dated October 17, 1962, and Defendants' Exhibit 105 which is a letter from Barton R. Gebhart, vice president of Freeman Coal Mining Corporation to you, dated October 18, 1962.

Initially, while Defendants' Exhibit 104 [1085] is just signed Elmer and it is addressed to Bart, I assume the Elmer is you and that the Bart is Barton Gebhart of Freeman, is that correct?

A That is correct.

[1086] Q Would you tell me, sir, the circumstances surrounding the exchange of this correspondence between yourself and Mr. Gebhart.

A This correspondence developed over a request by Mr. Gebhart to me to authorize Freeman Coal Mining Company to supply a portion of the requirements of this contract No. 401T3 that we had entered into with the Freeman Company, to supply a portion of it from the

United Electric Coal Companies mine, the Fidelity mine in Belleville, in the Belleville district of Illinois.

Q You state on Defendants' Exhibit 104, at the conclusion, "I feel that the contract is good for both of us and that we will certainly reap mutual benefits from it."

To what benefits as far as TVA was concerned were you referring?

A The primary benefits that I could visualize for TVA was this. I had been trying for some time to get greater participation from the Illinois coal field in TVA's market. TVA was becoming more and more dependent on the west Kentucky coal field for its coal supply. We were buying more than 30 percent of the total production from the west Kentucky field. It had reached a state of about 55 percent of total supply for [1087] the TVA system from that one field.

The Shawnee steam plant, which is located near Paducah, Kentucky, is relatively close to the southern Illinois coal field, some distance of 50 miles or so. I was seeking to supply that plant, and did for the time I was with TVA, with Illinois coal so that west Kentucky coals could be available for plants to the south of the producing field.

This move to authorize production from the Belleville field for the Shawnee market, I felt, was quite beneficial. It permitted TVA to enter into it on a volume basis for supply from an area from which it was not then receiving coal and had never received any significant amount of coal. So, for this reason, I felt this was a good move for TVA.

Q If you know, could United Electric have on its own competitively offered to supply coal to TVA at this time?

MR. SIMS: Your Honor, I object to this. This is highly speculative. He wouldn't have knowledge of what UEC could do.

THE COURT: Well, if he does, he may answer. I do not know whether he does or not.

BY THE WITNESS:

A The only way I can answer such a question as [1088] that is that the Belleville district from which the

United Electric coal or the Fidelity mine is located was not and had not participated in the TVA market. I assume it was because of economic factors. The quality of the coal from the Belleville district is somewhat inferior to the coal from the southern Illinois fields. So, for this reason, I would conclude that it is highly unlikely that they would have or could have competed with the other sources of coal for that Shawnee plant supply.

BY MR. HEDLUND:

Q What other sources are you referring to?

A The other sources are the west Kentucky coal field and the southern Illinois coal field.

Q Mr. Hill, in your opinion, and based on the facts that you have just stated, after the closing of United Electric's Buffalo Creek mine and the termination of the sales relationship with the Ruby mine, had they been independent of Freeman, would they have been able to compete with Freeman for the business of TVA?

A After the closing of the Buffalo Creek mine?

Q That is right.

A After the closing of their operations in the west Kentucky coal field, which moved them out of a [1089] normal source, a normal area of supply for us, I would question seriously that they could have competed.

Q Mr. Hill, do you recall the subpoena questionnaire that was sent to TVA in connection with this case?

A Yes. I think it came in connection with—as a subpoena. I recall some request for information from the Justice Department on this case, yes.

[1090] Q The reply to that subpoena indicates that in 1967 TVA purchased 34,000 tons of coal from Peabody's Mine No. 10 which the evidence shows is located in the Springfield Freight Rate District of the State of Illinois. Would you explain, sir, the circumstances under which that purchase was made?

A Yes. That was an unusual development. TVA had never bought any coal from what we classified as Central Illinois coal field, but just prior to the time this purchase was made, we had had several interruptions in production in the West Kentucky as well as Southern Illinois coal

field due to labor disputes. These were not industry-wide disputes, not national in scope, but were disputes that had interrupted production for intervals of a few days, a week, two weeks, and as a result of these interruptions the inventory at the Shawnee Plant had been reduced to a relatively low level. We had let the Shawnee Plant inventory drop more rapidly than we had other plants because we had the two fields from which we could draw coal. Plants such as the Johnsonville Plant or Gallatin Plant, which are both in West Tennessee were deriving their total supply from West Kentucky, so we let coal go on to those plants and two more on the inventory from the Shawnee Plant.

[1091] The inventory at the Shawnee Plant at the time that this purchase was made had dropped to a level of only about 115 or 120,000 tons, as I recall. There was a dispute in existence in the West Kentucky field at that time. In fact, the total West Kentucky field was out of production because of a labor dispute. It was a wildcat dispute, if I may term it as such.

It had been in effect for some ten days or so. We did not know how long it might last. Since the inventory at Shawnee was down to a level of ten days or so, we felt it was necessary for us to act under emergency conditions and seek to obtain additional coal from whatever source might be available. With my knowledge of sources of supply in the areas surrounding the TVA system, I concluded that the Peabody Mine No. 10 might be the best alternative.

Q Why was that, if you can recall?

A Well, it was and is one of the largest coal producing companies or mines in the United States. At that time I was buying from the Peabody Company out of West Kentucky about 5 million tons of coal a year. I had good relations with the officials of the Peabody Coal Company, I talked to the chairman, Mr. Merl Kelce, and I told him we needed some assistance, we needed [1092] help, we didn't know how long this dispute might last in West Kentucky, we couldn't afford for it to go on more than another week because it could interfere with the operation of the Shawnee Plant. I asked him if he could help me in providing

additional coal. He said he did have some stored coal at the No. 10 mine and that he could run the mine on a week-end for me if I was willing to pay the price. I told him we had to have the coal, and I asked him to be tolerant with the price. He agreed that he would ship me the coal at a price 25 cents a ton higher than the price he was receiving from his other customer.

[1093] Q Who was the principal customer of that mine at the time, if you recall?

A The principal customer was Commonwealth Edison Company.

I made the contract for the supply, based it with an open end, that they would ship me over a week-end some 30 to 40,000 tons of coal. The mine would be operated on a Saturday, and I didn't have a transportation rate at that time.

Q Do you recall with respect to this 34,000 tons of coal how many days it took you to get this shipment? I mean, was this something that went through the course of a month, or was it a shipment—

A No, it was a very short interval. It was shipped within a period of about four, five days, as I recall.

Q I notice from the reply to the questionnaire that the transportation on that coal was $2.50 a ton, just transportation.

A Yes.

Q That is just a little bit less, is it not, than the FOB mine price for coal which you were purchasing at that time from west Kentucky?

A I was buying some spot coal at that time at [1094] mine prices that were lower than the price, the transportation cost, on that partciular coal. This was considerably higher transportation rate than I was normally paying for coal from the Shawnee plant. Normal transportation rate was 85 cents a ton. I think I paid $2.50 a ton on this particular supply.

Q By the way, just to get a feel for the 34,000 tons of coal, approximately how many tons, just generally, of coal did that plant consume a year?

A Well, that plant has consumed between four and four and a half million tons a year since it was placed in full service along about 1954 or '55.

Q You say 4.5 to 5 million tons a year?

A No. 4 to 4.5 million tons a year. It was burning in the order of 12,000 to 12,500 tons a day, seven days a week.

Q Mr. Hill, in the five years immediately prior to your leaving TVA, other than the shipments from the Fidelity mine and the Belleville district and the 34,000 tons from Mine No. 10 in the Springfield district, did TVA consume any coal produced in the entire state of Indiana or in the Belleville-Springfield or Fulton-Peoria districts of Illinois?

A Not to my knowledge.

[1095] Q I believe, sir, you mentioned the new 1,300 megawatt coal-fired unit that is being constructed by TVA. Have I correctly described it?

A Yes. There are two units on order, 1,300 megawatts each, that are being placed at a site west of Nashville, Tennessee, on the Cumberland River.

Q If you know, has the coal supply for those units been obtained?

A Yes. The coal supply for some 15-year period has been arranged for. This has been done since I left TVA.

Q Do you know what the arrangements have been or what they are?

A Well, I know where the coal will come from and I know that the Peabody Coal Company will be the supplier.

Q Is this coal owned by Peabody?

A No. The coal will be mined from property that is owned by TVA. TVA acquired the property from General Services Administration. It's property that was previously the Camp Breckinridge property, Army property used during World War II.

Q Do you know whether that is deep coal or strip coal?

[1096] A This would be deep mined coal, yes.

Q How many tons a year would be produced out of that mine?

A Well, there will be two mines, as I understand it, each that are scheduled to produce 3.5 million tons annually.

[1097] Q So, this new facility will consume about 7 million tons a year?

A Yes, that is correct.

Q Mr. Hill, in your opinion has the common ownership, and before that the affiliation of Freeman and United Electric had any adverse effect upon TVA?

A Not in my opinion, no.

Q Has there been any benefit during that period?

A Well, I feel that the relationship, the common relationship between the two companies, is the primary reason that I was able to obtain the coal from the Belleville or Fidelity Mine of United Electric Coal Companies.

Q Mr. Hill, based upon your knowledge and experience and based upon the following assumptions, I then want to ask you whether in your opinion there would be any potential benefit to TVA that would follow from the divestiture of United Eletcric from Freeman.

The two assumptions that I wish you to make are that United Electric neither owns nor controls any coal reserves in the Southern Illinois Freight Rate District or in Indiana or in West Kentucky.

The second assumption I wish you to make is that at United Electric's existing mines all but [1098] approximately 4 to 5 million tons of reserves at those mines spread among the four have already been committed under long-term contracts.

With those two assumptions in mind, again based upon your knowledge and experience, can you see any potential benefit that might accrue to TVA that would follow from the divestiture of United Electric from Freeman?

A No, I see no disadvantage to TVA under the assumptions that you have described by virtue of the separation of the two companies. I see no advantage to TVA if the two companies are separated. That's the point I'm making.

Q Could you tell me why?

A Well, this is my conclusion in that respect, that if United Electric controls no coal in West Kentucky or Southern Illinois, which are the primary sources of supply for TVA at this time and have been for years past, that the reserves that United Electric may control elsewhere are inconsequential to TVA.

Q Speaking in terms of the numbers?

A Yes.

Also, if United Electric only has about 4 million tons of additional reserves that are uncommitted [1099] to

markets, this is not a significant amount of tonnage that would influence TVA's picture very much anyway. TVA is consuming more than 30 million tons a year at this stage.

Q In your opinion, Mr. Hill, at the time you left TVA would you describe the competition among your coal suppliers?

A At the time I left TVA competition was very strong.

MR. HEDLUND: I am sorry. I have one final question.

BY MR. HEDLUND:

Q During the last five or six years of your being with TVA, could you tell me what coal buying practices were followed with respect to long-term contracts or the so-called spot purchases?

A Well, the bulk of TVA's supply during the latter years I was with TVA was coming under long-term contracts. The spot supply was diminishing. This was brought about by the change in markets in part. Spot coal in the 50's was available in large quantities, primarily because of the production of resultant sizes from the mining or preparing of coal for more premium markets, domestic markets, we will say primarily.

Carbon, ordering sizes, screening, [1100] three-quarter's, inch and a quarter by zero, were available in large amounts and could be obtained on short-term purchases.

[1101] But, as the markets changed, as the domestic market dried up or diminished to a very low level, more and more of the full mine product had to be disposed of on the utility market, and to obtain assurance of supply, we went more to longer term contracts. The industry demanded longer term, coal industry demanded longer term contracts because of the capital investment involved in supplying a single product to a customer.

But, it was advantageous to TVA to have a longer term contract because it provided assurance of supply for operation of a tremendously and costly investment, which a coal-fired plant or steam electric plant involves.

Q Typically in those years, how long were these long term contracts? What was the duration of them?

A Most of the long term contracts that we made were in the order of 10 years. We did make a few that were as long as 15 years. The longest term contract that was made while I was with TVA was a 17-year contract for a mine-mouth plant.

MR. HEDLUND: Thank you, Mr. Hill. I have no further questions.

THE COURT: Are you ready to proceed, or would you like a short recess?

* * * *

[1103] CROSS EXAMINATION

* * * *

Q Who are you selling this coal to?

A It's primarily utility coal, going to Georgia Power Company, one of the utilities in the Carolinas, and some goes to TVA.

Q Are you making a profit for these companies?

A Yes.

Q Approximately what percentage of TVA's coal purchases when you were with TVA were bought under contracts of three years or longer?

A Well, at the time I left TVA, contracts of three years or longer were providing about 80 percent or more of the total supply.

Q Approximately what percent were under contract from six months to three years?

A 10 to 15 percent.

Q What percentage on the spot market?

A The balance, up to about 5 percent, was on the spot basis.

Q Why did you not purchase all your coal under long term contracts?

A Well, we didn't feel it was desirable to buy it all on long term contracts because of fluctuations in market for power generation. The shorter term contracts and spot purchases provided the opportunity to cut [1104] back on supply or buy more. We provided our base supply through the long term contracts, and the balance was used for the peaks and valleys of supply.

Q Your long term contracts did not provide that you could order more coal if you needed more or cut back some?

A They did provide, most of them provided, that we could cut back some, but as I recall none of them provided for us to increase the supply.

Q Did you find that you could purchase coal any cheaper buying on the spot market?

A Spot purchases generally were lower priced than were the longer term purchases.

Q Did you have any provisions in your long term contracts that would require the coal producer to give you a lower price if the price of coal in the area dropped?

A No. It would not require any supplier to reduce his price just because the price dropped in the area.

* * * *

[1106] Q Well, my question is, do you think TVA need not be concerned about the competitive situation among coal suppliers beyond southern Illinois and west Kentucky?

A Well, TVA is concerned about the competitive situation of coal suppliers in Tennessee, east Kentucky, Virginia, and so forth.

Q What about central Illinois?

A Well, since TVA has not bought coal from that area, I don't think it would have a primary interest in the competitiveness of that particular area.

Q Well, you did state on direct that this unusual situation, with this unusual situation, it went up to central Illinois to purchase some coal?

A That is correct.

Q In situations like this, does it benefit TVA to have a competitive situation in an area of this sort?

A In today's market or the market when I was with TVA, most coal is committed under some kind of contract at all times.

The situation that I described in connection with the No. 10 mine purchase I think is generally typical. There is no surplus of coal on short notice to my knowledge in any field.

Q Is it your opinion, Mr. Hill, at the present [1107] time that there is a shortage of coal in the TVA service area?

A Yes, I think there is a shortage of coal in the TVA supply area at this time.

Q Is it your opinion, Mr. Hill, that the coal companies have not responded adequately with sufficient supplies to meet demand and keep prices stable in this area?

A No, it is not my opinion that the coal companies have not responded properly. I think in my judgment that the developments with respect to the nuclear program in 1966, 1967, 1968, tended to discourage the coal industry from expansions in new mines, and that this lack of expansion which was due to concern about the future of the utility market for the coal industry—in my judgment, this is the primary reason at this stage for the shortage of coal supply.

Q Well, it was a fact then, though, that the coal producers did not produce adequate coal supplies to keep the prices stable. Is this not true?

A The coal industry does not have a surplus of production, that is correct.

Q The prices have been going up in the last two years, have they not?

[1108] A The prices have increased, yes.

Q When I talked to you on the phone, I think about a week ago, Mr. Hill, I think you said it was your personal opinion that one of the reasons for the reluctance of the Belleville mines to supply TVA's station was the fact that it had a better market in the St. Louis area. Is this not true?

A This is my opinion, yes.

Q If the St. Louis market contracts somewhat for coal suppliers in Belleville because of their pollution restrictions, isn't it likely that the Belleville district producers would begin bidding for TVA's coal contracts?

A I don't know because I don't know what is going to happen to TVA insofar as the pollution matters.

Q Mr. Hill, are you aware of any underground coal reserves owned by UEC in the Belleville district?

A No.

MR. HEDLUND: I am sorry, your Honor. May I have the question read back?

THE COURT: Would you read the question, please.

Q (Read by the Reporter.)

[1109] BY MR. SIMS:

Q Mr. Hill, do you have any way of knowing if UEC would have developed underground coal reserves in the Belleville district, assuming they have them, had they not been merged with Freeman?

A I have no way of knowing, no, what UEC might have done in that connection.

Q Do you have any way of knowing whether UEC would have offered these reserves to TVA?

A No.

Q You stated that UEC and Freeman coal was being shipped to TVA's Shawnee plant under a Freeman contract on direct.

A Yes.

Q Is both UEC and Freeman coal, or was both UEC and Freeman coal being burned in the same TVA boilers when this coal was shipped during the time you were with TVA?

A Yes. All that coal went to TVA's Shawnee steam plant.

Q Was there some difference in the quality between the UEC and the Freeman coal that you can recall?

A Yes, there was.

Q Were these differences simply translated [1110] into price?

A Yes. TVA's coal buying was based on the delivered heat cost of the fuel at the consuming plant. When Mr. Gebhart asked me to authorize the delivery of some of the Fidelity coal on the Freeman contract, he gave me quality information on the Fidelity coal. The quality was fully acceptable under TVA's specifications, but it was somewhat inferior to the coal that was supposed to be supplied by Freeman.

There was a price adjustment to bring the destination heat cost back to the same level. That adjustment as I recall was in the order of about 20 cents a ton.

Q When you were with TVA, there were a number of mines supplying the Shawnee plant, were there not?

A Yes, that is true.

Q Coals burned from these mines varied somewhat in quality, did they not?

A That is true.

Q In each case, you would simply translate the differences in the quality between the coal into delivered BTU price?

A That is the basis on which offers were evaluated in comparing bids for the Shawnee plant supply.

* * * *

[1113] Q Well, then, are you really in a position to say how competitive these coal companies were?

A I know that there was adequate coal supply offered each time that I went into the market to buy coal for the TVA plants.

Q This is the basis on which you conclude that it is a competitive situation?

A Well, I have general knowledge, or I had general knowledge, as to what it costs to mine coal. This was brought about by—

In fact, we had a staff of engineers. Each time we evaluated offers for supply to any of TVA's facilities, the reserves were checked, the equipment to be employed in supplying the coal was evaluated. With the engineering knowldge and know-how as to mining, it could be reasonably determined what the cost for production would be.

Q But the coal companies don't turn over to you their cost figures, do they?

A No, not normally.

Q You said you were mainly concerned with the supply of coal available to TVA, is this not true?

A When I was with TVA, I was interested in the available supply to our various plants. I was interested [1114] in the cost of that supply to TVA's plants.

* * * *

[1124] Q Is there any reason for an electric utility to have a mix in the size of the generating units that it has in operation within its system?

A Yes, there is a reason for having different size units.

[1125] Q Would you want all large size units in your system?

A No. It depends on the size of the system, however, because these units, regardless of whether they are coal-fired or may be nuclear units, they are not infallible; you do have failures.

If you have a large unit and it fails or its out of service for a period of time, it affects generation considerably more so than if it were a small unit.

MR. CUSACK: Your Honor, may I confer with Mr. Sims?

THE COURT: You may.

MR. CUSACK: Perhaps we can shorten this up a little.

(There was a short interruption, after which the following further proceedings were had herein, to-wit:)

MR. CUSACK: Thank you very much, your Honor.

THE COURT: All right. You may proceed.

BY MR. SIMS:

Q Mr. Hill, in your opinion, is TVA heavily committed to burning coal in the future?

A Yes, they are.

Q In your opinion, is TVA very concerned about the competitive conditions among coal suppliers?

A I would think that they are concerned, yes.

* * * *

[1126] Q To the best of your recollection, what did they relate to you in these conversations concerning the affiliation between UEC and Freeman?

[1127] A Well, I was told by both the Freeman and the United Electric officials that Freeman or Material Service was acquiring stock in the United Electric Companies. I recognized that United Electric's reserves in the west Kentucky field where they had been separated

from or been a competitor, I will say, in our market, were being depleted. So, therefore, I had no concern about the affiliation because it appeared to me that there was no change in competitiveness of the companies for TVA's coal supply.

Q Do you know what coal UEC would have made available to TVA, say, subsequent to 1960 but for its affiliation with Freeman?

A No, I do not.

Q Defendants asked you, I think, before to make an assumption that UEC had no coal reserves in southern Illinois, Indiana or west Kentucky.

Is it your opinion that coal reserves of UEC in the Belleville district, which is right next to southern Illinois, would never become a competitive force in TVA's fuel requirements?

A All I can look to is the history. It was not a competitive force. I would have to assume that the history is the best guide that I have.

* * * *

[1131] Q If they had acquired coal in west Kentucky, also would they not have been a competitive force?

A The answer is the same.

Q Would it be the same if they had acquired coal in southern Indiana?

A No, the answer would not be the same on Indiana, because Indiana had never been a force in competition for TVA's coal supply.

Q Assume that because of the foregoing absence of competition between UEC and Freeman due to the association, UEC did not acquire reserves which it could sell to TVA. Would that not necessarily have had an anti-competitive effect on TVA?

MR. HEDLUND: I am sorry, your Honor. May I have the question, please.

THE COURT: Read the question.

(The question was read by the reporter.)

MR. HEDLUND: I am going to object to this hypothetical. There is no evidence in the record to support the assumption that Mr. Sims has asked the witness to make.

THE COURT: Where in the record is there anything [1132] to support this assumption?

MR. CUSACK: May I answer that?

THE COURT: No, he is conducting the examination. Either he knows or he does not.

MR. SIMS: There has been testimony, your Honor, that large sums of money were built up under UEC's current assets. I think we can argue and will argue that had not this money been built up within UEC's accounts that they would have, in fact, gone out and purchased, been more aggressive in purchasing, reserves in other sections of the country.

THE COURT: I do not know how we can assume that. The objection is sustained.

[1133] BY MR. SIMS:

Q Mr. Hill, didn't Thomas Tarzy, vice president in charge of sales of UEC, talk to you about selling TVA coal from the Fidelity Mine of UEC before UEC started selling coal to TVA under the Freeman contract?

A I had even tried to encourage Mr. Tarzy to sell me some coal from the Fidelity Field or Fidelity Mine because as I stated earlier I was seeking to obtain additional coal from Illinois to satisfy the total requirements of the Shawnee Plant. Unfortunately, I had not been successful in obtaining an offering of that coal prior to the arrangements made through the Freeman Company.

Q TVA did receive some coal from Truax-Traer's Burning Star Mine in the Belleville District at one time, did they not, Mr. Hill?

A Yes. As I recall, in the mid-50's or thereabouts some coal was bought from the Burning Star Mine of Truax-Traer, but it was resultant sizes, was bought primarily on a spot basis and at a very low cost.

Q Do you expect TVA's purchasing of coal to increase in the next five years?

A I would think so, yes.

Q What about in the next ten years?

[1134] A I think so.

Q TVA is not concerned about air pollution restrictions?

A I'm sure they are.

Q But, you do not think this will affect the amount of coal TVA burns in the future?

A I think it can affect the amount TVA burns in the future, yes, but I do feel that TVA will consume more and more coal during the next ten years.

MR. SIMS: May I have just a moment, your Honor?

THE COURT: You may.

(There was a short interruption, after which the following further proceedings were had herein, to-wit:)

MR. CUSACK: Thank you, your Honor.

MR. SIMS: I have just two more questions, your Honor.

THE COURT: All right.

BY MR. SIMS:

Q Mr. Hill, approximately how much coal did TVA consume in 1950?

A In 1950?

Q Yes.

A Slightly less than a half million tons, as I [1135] recall.

Q Approximately how much did they consume in 1960?

A About 20 million, I would think.

Q In 1966?

A About 26 million.

Q What would you estimate TVA would consume in 1970?

A In 1970?

Q Yes, sir.

A About 33 million.

Q Would TVA have built a fossil plant rather than a nuclear plant if they had known that the Brown's Ferry unit would have been delayed as much as 12 months in your opinion?

MR. HEDLUND: May I have that question back, please?

THE COURT: Read the question.

Q (Read by the Reporter.)

BY THE WITNESS:

A You mean built a fossil plant in lieu of the nuclear plant?

Q Yes, sir.

A I think they would have built a fossil plant, but I think they would also have built the nuclear plant.

* * * *

[1150] AFTERNOON SESSION

2:00 P.M.

* * * *

RICHARD DROLLINGER,

called as a witness by the defendants herein, having been first duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. HAUBOLD:

Q Sir, would you please state your name and present home address.

A Yes. My name is Richard Drollinger. I reside at 18270 Lamplighter Lane, Brookfield, Wisconsin.

THE COURT: Will you spell your last name?

THE WITNESS: Yes, sir. D-r-o-l-l-i-n-g-e-r.

THE COURT: Thank you.

THE WITNESS: Yes, sir.

BY MR. HAUBOLD:

Q Mr. Drollinger, are you appearing here today pursuant to subpoena?

A Yes, I am.

Q Who is your present employer and what position do you hold?

A I'm presently employed by Harnischfeger Corporation, Milwaukee, Wisconsin. I am director of [1151] engineering for the construction mining division for that company.

Q Mr. Drollinger, would you briefly describe your educational background?

A Yes. I graduated from Ohio Northern University, Ada, Ohio, in 1949 with a Bachelor of Science degree in mechanical engineering.

Q How long have you held your present position, Mr. Drollinger?

A Since June of 1968.

Q Prior to June of 1968, by whom were you employed?

A I was employed by Marion Power Shovel Company, Marion, Ohio.

Q Is Marion Power Shovel Company engaged in the manufacturer of large stripping equipment utilized in coal mining operations in the Midwest?

A Yes, sir.

Q How many such companies are engaged in the manufacture of such equipment?

A There are only two companies, Mr. Haubold. Marion Power Shovel Company and Bucyrus-Erie at South Milwaukee.

Q Mr. Drollinger, do you know what the present dollar value of large stripping machinery currently [1152] employed in the Midwest is in terms of a comparison between Marion and Bucyrus-Erie?

A Would you rephrase that, Mr. Haubold, please, so that I can understand the question?

THE COURT: Will you read the question?

Q (Read by the Reporter.)

BY THE WITNESS:

A Yes. Marion and Bucyrus-Erie share equally in the market for large stripping excavators.

BY MR. HAUBOLD:

Q Mr. Drollinger, would you please state the positions that you held with Marion, and for each position could you briefly describe what your duties were?

A Yes, sir. I started as an engineering trainee with Marion Power Shovel after graduating from college, moved into manager of design for the intermediate machines. These are machines of two crawlers, mounted on two crawlers, excavators and draglines. I had the responsibility for the design of those particular machines for some period of time. I then moved into the position of manager of design for large stripping machines. This is both walking draglines and stripping shovels. I was then appointed manager of engineering, had the [1153] responsibility for the entire 140-man engineering department, and then was finally appointed, prior to my departure from Marion, as vice president of engineering with the same responsibilities as manager of engineering. [1154] Q Mr. Drollinger, when did you become Manager of Machinery Design at Marion, approximately, if you recall?

A Well, I left in mid-'68. About 1964, mid-1964, I had the responsibility for Manager of Design.

Q Now, Mr. Drollinger, during the period that you were Manager of Machinery Design and Vice President of Engineering, would you describe the frequency and nature of the contacts that you had at Marion with various coal mining companies engaged in strip mining in mid-western coal fields.

A Because of the specialized nature of the business, it was necessary that the engineering representative be present at all discussions pertaining to new machine proposals, machine modifications and this type of thing. So, I had intimate contact during that period of time with all of the major coal concerns where these discussions came into being.

Q Could you describe how frequently these discussions took place?

A Well, you understand, of course, that Marion was not successful in getting all of the business, but this was a general practice that when a coal company had in mind the purchase of new equipment, they contacted [1155] both Marion and Bucyrus. So, I would say that perhaps in that period of time there were some, a minimum of 50 discussions of that nature.

Q Mr. Drollinger, are you currently familiar with the present state of technology in the design and construction of large stripping equipment?

A Yes, I am.

Q Have you kept abreast of any developments which may have arisen since you left Marion in June of 1968?

A Yes, I've followed very closely the operation of both the Marion machines and the new large Bucyrus machines. I've made numerous field trips, I've continued my association with the coal miners through these associations, these trips.

Q Mr. Drollinger, during the period of time at Marion, while you were Vice President of Engineering and head of Machinery Design, was it a part of your duties to be familiar with the limitations of large strip mining equipment in terms of economic feasibility?

A Yes, it was.

Q Can you describe the extent of your familiarity with the limitations of stripping equipment in terms of economical feasibility?

[1156] A Well, it was—normally these proposals went this way: the customer would have some production requirements that he needed to fulfill. He also had some idea through test drillings and that type of thing to know what the stripping operation would consist of. So, it was necessary that he contact the appropriate people. This job initially fell on Engineering to make the first proposal, and it was in this way that we participated in all of these discussions.

Q Now, Mr. Drollinger, could you name some of the coal mining companies with whom you personally worked in evaluating the suitability of strip mining machinery for particular coal mining sites?

A Yes. Some of the names that I recall, Peabody Coal Company, Ayshire Collieries, Southwestern Illinois Coal Company, Truax-Traer. These are the types of companies that I dealt with.

[1157] Q Now, Mr. Drollinger, in general terms can you describe the functions that a stripping machine must perform in strip mining coal?

A Yes. It's the function of this stripping machine to remove the material that overlies the coal, deposit it far enough away from the excavations so that the coal can be taken out. The material that's taken off the top of the coal is called overburden, and this is the term that's applied—that's the material overlying the coal.

Q If I understand you correctly, overburden is expressed in the number of feet or a particular depth, is that correct?

A That's correct.

Q Is the term "overburden ratio" also used in the strip mining business?

A Yes, sir, it is. It's a term that's vital in the sizing of a machine. Overburden ratio is the ratio of the number of cubic yards of material that must be moved to get at a ton of coal. There is a general rule of thumb that says that the overburden ratio—perhaps I best illustrate.

If the overburden depth is 80 feet and the coal seam is 4 feet in thickness, the overburden [1158] ratio in this rule of thumb approach would be 80 divided by 4, or 20 to 1. This term is used extensively in strip operations.

Q Mr. Drollinger, do you know what the largest strip machine currently operating in Illinois is?

A Yes, it's the Marion-type 6360, in operation at the Captain Mine, Southwestern Illinois Coal Company.

Q Do you know what the extent of overburden being removed by this machine at this site is?

A That machine is operating in overburden of about 80 feet in depth.

Q Now, Mr. Drollinger, what role did you personally have in the design and development of this Marion 6360 machine?

A The Marion 6360 was developed during the period of time when I had the responsibility for the engineering department. Now, I'm sure you understand that this was not a one-man operation, and I had control and the responsibility for the department. I didn't personally put all the lines on the paper.

Q So that we can understand a little bit of the dimensions of the Marion 6360, can you give us some of the

vital statistics on this machine in terms of height, weight, bucket size and so forth.

[1159] A Yes, sir. Mr. Haubold, this is a difficult piece of equipment to describe. I'm sure that when you hear the word "excavator", many people automatically think of the machines that they see parked alongside the highway, but this is a far cry from this type of machine.

The Marion 6360 had a working weight of 28 million pounds. It had a 180 cubic yard bucket. Now, these dimensions in themselves are not meaningful, but we made some comparisons at one time to illustrate the size of the machine. We found that the 180 cubic yard dipper was sufficiently large to hold 15 Volkswagens. The machine has the capability of lifting a half a million pounds, swinging that half a million pounds about a tenth of a mile away, and depositing that half a million pounds on the top of a 15-story building. So, you see, it's not the type of machine that you see digging basements and in areas like that.

[1160] Q Is this machine, Mr. Drollinger, designed for stationary use or does the machine move?

A The machine is mounted on eight crawlers of the type similar to those that you might find on a bulldozer, and again it's only the type of mechanism that we're talking about. These are tracts. But, again, to give you an idea of the tract size, there are about 340 such crawler shoes making up these eight belts. I guess 342, to be exact, and each one of these crawler shoes weighs as much as two average automobiles.

So, you can see that we're talking like 700 automobiles in weight alone, just to make up the crawler shoes.

Q What is the height of the machine, Mr. Drollinger?

A Well, the machine over the boom point is probably in the neighborhood of 180 feet. As I said, it can deposit this half million pound load on the top of a 15-story building, so the boom point is higher, of course, than the load, about 180 feet.

Q Mr. Drollinger, what did this machine cost the coal company to purchase from Marion?

A Well, that's a difficult question to answer, Mr. Haubold, because there are a number of things that [1161] must be considered in the cost.

First of all, there's the original purchase price, and this is a machine that costs the customer FOB Marion about $16 million. But there are other costs involved, costs that have a definite bearing on the machine cost ready to operate.

Q Could you describe these additional items of cost from the customer's standpoint?

A Yes. It's the customer's responsibility to pay shipping costs for a machine of this size, and again to give you some concept of the size, it required 350 rail cars, standard rail cars, to ship the machine, so the freight bill alone was rather large.

Then it's also the customer's responsibility to assemble the machine on the digging site. This requires about 300,000 erection hours. These are hours spent in the field after the machine arrives, at a cost of $6.00 an hour, which is a reasonable number for field labor of this kind. You can see that there's approaching another $2 million in cost in erection fees alone.

[1162] Q Mr. Drollinger, from the standpoint of economic feasibility, do you have an opinion as to what the maximum capabilities of the Marion 6360 machine is in terms of maximum overburden removal?

A That machine was designed to operate in overburdens not to exceed as a general practice 100 feet.

Q From the standpoint of economic feasibility, Mr. Drollinger, how is the depth of stripping operations related to machinery size?

I guess what I am really asking at this point is, why do you need a machine of such enormous size and cost to handle 80 feet of overburden?

A Well, it is necessary when you are handling overburdens of this depth to remove the material as quickly and as efficiently as possible.

I am sure, again, you understand that, to be completely ridiculous, if you would want, it would be possible to remove this type of overburden with a teaspoon, but this is not a practical approach from an economic standpoint. So, the concept is to have a big machine of this capacity moving the overburden. This is this only way it is economically practical.

Q Mr. Drollinger, you stated that the Southwestern Illinois Coal Company site which utilizes the Marion 6360 re- [1163] moves approximately 80 feet of overburden.

Are you aware of what overburden requirements the Marion machine was required to meet at this site in order to be economically feasible?

A Yes. This was one of the original design considerations for the machine. Southwestern Illinois Coal had commitments for enough coal to fill a 180-car train on a daily basis.

Then, knowing the material that had to be removed to obtain that kind of coal production, the Marion 6360 was developed and sized accordingly.

Q Do you know in terms of cubic yard removal what the overburden removal as contrasted with the coal production figures was required at this site?

A The machine was developed with the capability of handling about 5 million cubic yards a month.

I would say, again, as a good comparison, this is like 50,000 standard hopper cars, to give you some idea of the production.

Q Mr. Drollinger, has Marion ever made an attempt to determine the per hour cost of operating the Marion 6360?

A As part of our initial study—as part of Marion Power Shovel's initial study, we tried to establish [1164] what the operating cost of a machine of that size might be or what the down time would actually cost. We estimated that that down time would run in the order of magnitude of $3,000 an hour. This number was confirmed, by discussions with mine management after they had the machine in operation.

Q In determining these costs, Mr. Drollinger, what assumptions were made in terms of the machine's operating life?

A It is general practice for a machine of this size to be operated on a year-round basis, three shifts a day. It is generally assumed that the machine would operate for no less than 25 years. That is pretty much determined to be the minimum period of operating life for these machines.

[1165] Q In terms of the assumptions relating to the machine's operating life, on a daily basis, what type of

operation were you considering here? Was it a virtual 24-hour operation? You mentioned three shifts.

A Yes. It is a three-shift operation virtually, as much as practical, 24 hours a day.

Again, to give you some idea of the necessity of keeping this machine in operation, it is standard practice for the coal companies to allow the oiler—this is a two-man operation generally, an operator and an oiler. In order to keep the machines in operation during the period of time that the operator is eating his lunch, the oiler is given the opportunity and the requirement to operate the machine and keep it digging. That is the whole requirement.

Q Mr. Drollinger, in the context of the Southwestern Illinois project involving this 80 feet of overburden removal, I would like to get some idea as to how difficult a task it was to design this Model 6360.

Can you describe any major difficulties you encountered in the design of this machine, if any?

A Yes. There were many, many problems involved. The sheer size of the unit alone brought on many problems, many that we had not planned on initially.

[1166] We talked before about the crawler shoes; the problem in getting a million and a half pounds of good sound castings is a real problem in itself.

To give you some idea of the engineering time involved in the development of a machine of this size, Marion spent about 80,000 engineering hours alone in the development of this machine. This is like 40 man-years for one man to work up the machine.

Q How important a consideration was reliability in designing this 6360 machine?

A Without question—

MR. EISEN: We would stipulate that reliability was important, your Honor.

MR. HAUBOLD: I would prefer that the witness answer the question and describe the context in which reliability played a role.

THE COURT: Go ahead.

BY THE WITNESS:

A Reliability was the number one item of consideration in the development of these machines. As I say, this

is not an excavator. It is for all practical purposes a digging factory. When it is not in operation, the man's factory is down. It is vital that the machine stay in operation.

[1167] BY MR. HAUBOLD:

Q Were there any problems encountered in terms of this particular machine's operations in the context of the pit operations which caused you special difficulty when the overburden approached or exceeded 80 feet?

A Well, there were a number of problems that had to be considered as a part of the initial design. Some of the problems—some of the considerations we had fortunately did not turn out to be problems, but there is difficulty in the operation of a machine of this size in knowing whether or not the sheer weight alone would destroy the pit.

This is difficult to describe. Perhaps the best comparison I could make would be to consider a billiard ball or something of this nature sitting on a wet napkin.

We had concern—no one had ever put a 28 million pound machine on a coal seam before. No one knew whether or not the coal seam would sustain that kind of a weight. The gambles involved and this kind of thing, I am sure you can appreciate, were rather large.

If the coal seam would not hold the weight, if the material below the coal seam would not give firm [1168] enough footing, it is conceivable that the unit would have gone through the coal and, for all practical purposes, the $16 million investment, the initial cost, would have been lost because the machine can't operate that way. It is necessary that it operate on the coal.

[1169] Q Mr. Drollinger, in the event that an unforeseen technical problem might have arisen involving the inapplicability of this machine to the given site who bears the risk of this cost in terms of industry custom and practice?

A It has been industry custom or practice in the past that the vendor, the machine vendor bear the cost of any field failures, any field fixes that are necessary.

I am told that Marion Power Shovel is now available for sale at some number like $22 million. This is im-

portant only in saying that the Marion 6360 for all practical purposes represents the net worth of the company. An error in judgment for all practical purposes could bankrupt the company.

Q Mr. Drollinger, are there any problems which become more accentuated in terms of difficulty and expense when overburdens increase concerning removal of the overburden or the material under the surface?

A Well, the purpose of the machine as we talked is to remove the overburden and deposit it in such a manner that it doesn't come back into the excavation. As the overburden increases in depth, the problems involved in depositing this material far enough away to keep it from coming back into the pit, into the [1170] excavation, presents more and more of a problem.

I do know of instances where the spoil pile, the overburden deposited off to the side, has come back into the pit and has in some instances caused fatalities by crushing the operator as he was caught in the cab of these machines. So, this is a real problem.

Another problem that any excavation faces is that possibility of operating below the water table where they might flood the excavation and it might make pumping necesary if pumps will do the job. This only increases the cost. So, there are a number of considerations involved.

Q Mr. Drollinger, based on your experience and knowledge, do you have an opinion whether there are any practical limits on the maximum overburdens and overburden ratios likely to be achieved in the Midwest coal field within the next five to ten years?

A Based on my experience and the intimate customer contact that I have had, I would say that probably we are facing the limitations of about 100 foot in overburden depth, and at the outside, the maximum overburden ratio of 25 to 1.

Q Mr. Drollinger, is it possible by simply [1171] increasing machinery size to design and operate a stripping machine in the Midwest which is capable of stripping in excess of 100 feet of overburden?

A I think perhaps, Mr. Haubold, that it is possible to build, to design and put the lines on paper of a machine

that will dig in excess of 100 feet in depth. The method of fabrication of a machine of this size, the problems involved in operation, I don't know. There are many unknowns still involved.

Q Well, in your judgment, would it be economically feasible to build and operate such a machine in the Midwest?

A I can't believe that it would be economically feasible. I have indicated the numbers of problems involved in the design and fabrication of a machine of this size. There are companies besides the vendors of the equipment that also get involved in the fabrication of a machine of this size.

For example, one of the electrical vendors had to design and build an electric motor specifically for the Marion 6360, an electric motor larger in size of that particular type than they had ever built before.

[1172] I also know that for successful operation of the large Bucyrus walking drag line, it was necessary for a rope vendor to spend approximately $1 million to develop a machine capable of manufacturing the five-inch diameter rope that that machine required.

My point is that the participation of not only the company doing the initial design, but all of the associated companies, has a bearing on whether or not a larger machine could be built.

Q If the decision were made today that a larger machine would be built or, at least, it would be attempted, do you have any opinion as to how long it would be until such a machine could conceivably be operating in the field?

A Well, that is a difficult question to answer. The Marion 6360—and I guess that is the only way I can answer it—the Marion 6360, the 180-cubic yard machine, required some three years from the time the initial discussions started until the machine was ready to go into operation. Without knowing what problems might be involved and without considering any unknowns at this time, I would presume that perhaps as long as five years would be required before a machine larger than the 6360 could be developed and put into operation.

[1173] Q Do you have any kind of rough estimate as to what this machine might entail in terms of consumer cost if it could be technically built?

A It is safe to assume that the Marion 6360, ready to dig, costs in the order of $20 million. It is conceivable to me that a machine perhaps half again as large as the 6360 might run double the cost, perhaps as much as $40 million.

Q So that I understand you, you do not believe that this is as feasible possibility at this time from an economic standpoint?

A No, sir.

Q Are these large machines that we have been talking about such as the Marion 6360 readily transferable from one coal mining site to another?

A Mr. Haubold, these machines are designed to operate in a particular pit. The overburden ratio, the type of pit, the coal—all of these have a bearing on the machine design.

If you will recall, we also said some 300,000 hours erection time was required to put them together initially. So, it is plain to see that to tear a machine down—the machines are actually fabricated in the field much the same as a ship is built on the waves.

[1174] Both Marion and Bucyrus follow the practice of taking to the field regular machining equipment, milling equipment and this type of thing. The machine is too large to bring into a machine shop. I am sure you appreciate that.

So, because of all of these limitations, it is not practical to assume that a machine like that could be torn down, shipped and reassembled in another area.

[1175] Q Mr. Drollinger, in your discussions with coal mining companies concerning the economic feasibility of utilizing your Marion machines for various coal mining sites, has the subject of reclamation requirements or laws ever been considered?

A Yes. Reclamation, of course, is becoming more and more of a consideration for mining companies. It is a definite cost in stripping that must be considered. The higher the overburden—I am sure you appreciate

that the larger the machine and the higher the overburden, the more difficult it is to level out the spoil piles that are deposited from the excavation. The more difficult it is, of course, then the more cost is involved.

I know that coal companies have been searching for equipment large enough to allow them to perform this reclamation at some reasonable cost. The present equipment with the large machines is not practical from a cost standpoint.

Q Mr. Drollinger, did you have the opportunity to examine Table 5(a) in the report prepared by the Paul Weir Company in this case?

MR. HAUBOLD: A copy of this report, your Honor, has been received in evidence as Exhibit 87.

[1176] MR. EISEN: Is that a defendants' exhibit or a Government's exhibit?

MR. HAUBOLD: It is defendants' exhibit.

BY THE WITNESS:

A Yes, sir, Mr. Haubold, I have examined this Table 5(a).

BY MR. HAUBOLD:

Q This table purports to reflect the initial investment per ton required to strip mine coal at various overburden ratios.

Now directing your attention to the data on the cost of stripping equipment, are the figures set forth accurate?

A Looking at the column for overburden ratio, 25.2 to 1, Mr. Haubold, I see that the stripping shovel capital costs are estimated to be $15 million.

As I have indicated, I would expect that the ready-to-operate cost of that machine is in the order of $20 million. So, these figures are conservative.

The initial investment, this $11.75 investment per annual ton, I would think should be higher than it is shown here.

MR. HAUBOLD: I have no further questions, your Honor.

[1232] GEORGE GAMBLE,

called as a witness by the defendants herein, having been first duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. HEDLUND:

Q Would you please state your name, address and occupation.

BY THE WITNESS:

A George Gamble.

THE COURT: Spell your last name, please.

THE WITNESS: G-a-m-b-l-e.

BY THE WITNESS:

A (Continuing.) My address is 1821 Viking Way, La Jolla, California. I am a self-employed consultant, working primarily for Gulf General Atomic in La Jolla.

BY MR. HEDLUND:

[1233] Q Mr. Gamble, would you please briefly describe your educational and business background.

A I graduated from the University of Virginia in 1922 with an E. E. degree, electrical engineering.

I went to work for the General Electric Company in Schenectady, New York, on their test course, and later worked in the field and office for them for about two years.

I then went with the Stone & Webster Engineering Corporation of Boston, and worked in the field and also in the office for them for a total of 7½ years.

My last job was that of resident electrical engineer on the Osage Hydroelectric Project in the State of Missouri which was being built by Stone & Webster for the Union Electric Company of St. Louis.

At the completion of that job, construction work was at a very low ebb, indeed. I was offered a position by the owning company, Union Electric. I had the presence of mind to take the job and stay there the rest of my working life.

When I went with Union Electric, I started as a, I presume, a junior engineer with no particular title. Over the course of the next 34 years, I became [1234] Superintendent of Power Production and Vice President of Power Production and Vice President of Production and Distribution and Operating Vice President and Executive Vice President.

[1235] Q Was executive vice president your title upon your retirement from Union Electric?

A Yes. That was on October 1, 1966.

THE COURT: After that, you went to a sunny climate?

THE WITNESS: I went to a good climate, yes. Not St. Louis. St. Louis was not good. I will take up St. Louis, too.

THE COURT: In the summer?

THE WITNESS: Yes, sir.

BY MR. HEDLUND:

Q Mr. Gamble, at any time were you a member of the board of directors of Union Electric Company?

A Yes. I was elected in April of 1962 as a director, and I am still a director.

Q You are still a director?

A Yes.

Q Would you tell me, Mr. Gamble, what responsibilities you had in the last six years of your employment by Union Electric, what responsibilities you had with respect to the coal buying by that utility?

A Well, the last six years, that was after we had divested ourselves of any coal mining properties. I simply had broad supervision over the Purchasing Department where we had, you might say, a very highly [1236] qualified expert who was actually the coal buyer. I didn't do any coal buying as such myself, but he did the buying and he was responsible to me. He was one of, oh, roughly six or seven departments that reported to me.

Q Could you tell us the name of the man to whom you were just referring?

A Mr. Mark Covell.

Q Could you spell that, please?

A C-o-v-e-l-l.

Q Did anyone succeed Mr. Covell in his function?

A Mr. Louis R. Tomey, T-o-m-e-y, succeeded Mr. Covell just about the time that I retired. Mr. Covell and I retired within six months of each other.

Q At the time you retired, was Mr. Tomey reporting directly to you?

A Frankly, I have forgotten whether Tomey—whether Mark retired a little ahead of me or a little after; I don't remember. But he would have reported to me had he succeeded Mr. Covell at that time.

Q You mentioned the coal mining activities of Union Electric. Could you tell me what, if any, participation or responsibilities that you had in that regard and the dates on which you had those responsibilities?

A When I became operating vice president in [1237] 1954, I took over from the preceding operating vice president, who at that time became executive vice president. I took over the running of our coal mines as part of my several departments of responsibility.

I had, more or less, administrative disposition, management of those mines. I never pretended to be a coal miner, but I was seeing that the mines were run in a way acceptable to our management.

Q Was the coal mining activity of Union Electric carried on by a subsidiary of Union Electric?

A It was under the Union Colliery Company which was a subsidiary of our company.

Q Did Union Colliery have a mine in Illinois?

A Yes.

Q What was the name of that mine or mines?

A The name is the Kathleen Mine down in DuQuoin, Illinois.

Q Would that be in the Belleville freight rate district, if you know?

In that connection, I show you what has been received in evidence as Nugent Deposition Exhibit 38, which is a map of shipping coal mines in Illinois by Jack Simon.

MR. FUTTERMAN: Mr. Hedlund, the Government will [1238] stipulate that it is in the Belleville freight rate district.

MR. HEDLUND: Thank you.

[1239] BY MR. HEDLUND:

Q Mr. Gamble, let me start this way, if I may. What became of the Union Colliery properties in Illinois in, say, 1958?

A The Union Colliery mine and reserves were sold in, I believe it was 1958.

Q To whom were these properties sold?

A A combination of Truax-Traer and United Electric Coal Company.

Q Do you recall what was sold to each of those companies?

A It was my impression at the time that it was a joint sale, but I know that they divided up. Maybe we knew that, but I wasn't really negotiating the sale. So that the coal mining reserves, especially the strip reserves, which were contiguous to the United Electric Coal properties and were part of our coal reserves, were taken over by United Electric. The mine itself and the equipment and tipple and what-have-you were taken over by Truax-Traer.

Q Do you know whether the mine continued in operation after this sale?

A I am quite sure it did not, certainly not for any length of time.

[1240] Q Could you tell me, sir, prior to this sale, who consumed the output, if you know, of the Kathleen Mine of Union Collieries?

A That was a 100 percent captive operation of our company. We burned all of the coal that came from it. We had our own railroad to deliver that coal from DuQoin to our plants.

Q Why did Union Electric decide to dispose of the mining properties of Union Colliery?

A Well, at the time that decision was made, the coal business was becoming a very large business, indeed, in general. There were a good many strong companies in the field. The cost of strip mining and other things were beginning to bring down the cost of coal.

Frankly, we didn't feel that we could be in the best interest of ourselves and our customers by continuing

what might be a small mining operation. We thought we could do better by getting competition between professional coal mining suppliers.

Q Did you believe that you would be able to buy your coal cheaper from coal producers than to mine it yourself?

A That was our belief.

[1241] Q Did subsequent events prove you correct?

A I am very sure they did.

Q Mr. Gamble, I show you what has been received in evidence as Government Exhibit 87, which is a table entitled "Acquisitions in Eastern Interior Coal Province Since 1954."

MR. HEDLUND: Does the Government have a copy of the report?

MR. FUTTERMAN: Yes. Just a moment.

(There was a short interruption, after which the following further proceedings were had herein, to-wit:)

MR. CUSACK: (Handing document to Court.)

BY MR. HEDLUND:

Q I direct your attention, Mr. Gamble, to page 2 of this chart. You will notice in the left-hand column that it is headed "Acquiring Coal Company." In that column, there is the name of Truax-Traer. It refers to an acquisition of the new Kathleen Mine of Union Colliery.

My question, sir, to your knowledge, is that the properties that we have been discussing in terms of the sale to Truax-Traer?

A I am very sure it must be.

Q You will note that that acquisition on that [1242] table is dated 1958, and there is a production figure for the last year prior to the acquisition, the tonnage of 1,157,000, I believe.

Was that approximately the production of the new Kathleen Mine in 1957?

A We called it normally a million-and-a-quarter-ton-year mine that qualifies in any one year.

[1243] Q Do you recall when the new Kathleen Mine was opened?

A 1947.

Q Mr. Gamble, I show you what has been received in evidence as Government Exhibit 53, which is a chart entitled "Production of Coal in Illinois by the Leading Companies and their Subsidiaries for the 1958 Calendar Year."

I direct your attention—

MR. HEDLUND: May I approach the bench, your Honor?

THE COURT: Yes, you may.

MR. HEDLUND: Thank you.

BY MR. HEDLUND:

Q I direct your attention to the listing of companies, and ask you if the name Union Colliery Company appears thereon?

A Yes. It is roughly the fifth from the bottom.

Q Would that be the same Union Collieries, to your knowledge, that we have been speaking of?

A Yes, I am quite sure it must be.

Q I note that on that table, there is production of 577,000 tons. You have testified this was basically a million-and-a-quarter-ton mine of annual [1244] production.

Do you know why the production of that mine decreased from 1957 to 1958?

A Well, the mine was sold in May, I think it was, of 1958. I think it was May 29th. So, we had only five months of production in that year. That would be far short of an annual production.

Q Mr. Gamble, could you explain briefly the nature of your consulting work for General Atomic and briefly how you came to become a consultant for General Atomic?

A Well, how I became that was somewhat of an accident. I called up Mr. Claire one day to ask him a question. When we got through, I said, "I hope I see you someday before long, Ty. If you want to see me before I retire, you better get by here pretty soon." He said, "My God, are you going to retire?" I said, "Yes."

So he said, "Come here and go to work for us." That was the story. It was a longer story than that, but I did go to work for them.

Q Mr. Claire was whom?

A Titus Claire, he was one of the Gulf dealers at that time at General Atomic Division of General Dynamics. He was in charge of their so-called commercial—[1245] we never used the word—sales department. That is what it amounted to. So, he got me to come out there and go to work for them primarily on account of my—well, two things: my general knowledge of the way power companies function in the field of power, and also primarily because I knew a great many people in the industry, having been reasonably active certainly within the last 20 years. So, I worked with them out there since that time.

At first, I put in a year or two of doing a fairly decent job of learning the science. I thought that my ripening years had got me past completely in the atomic field. I graduated from Union Electric without knowing a thing about atomics, but I went out there and had to start over again. I did a fair job and I do understand what it is they are doing. I don't pose as an expert, but I can keep up with a good many people on it. I have used that in my contact with utilities and have helped them make contacts and it helped make some of the presentations to the utilities.

Q Could you briefly describe the reactors under development by General Atomic?

A Yes. The first reactor is what we call the high-temperature gas-cooled reactor, which is a [1246] reactor in the thermal spectrum. It is, you might say, a competitor or similar to the water reactor as manufactured by the four other manufacturing companies in that it generates heat through the use of what we call slow neutrons, namely, in the thermal field.

[1247] I state that to differentiate it from the so-called fast reactor which I will talk about a little bit later.

Now, in the high-temperature gas-cooled reactor, Gulf General Atomic, as I will now call it because we were

bought in November of 1967, I believe it was, by Gulf Oil—that must be November of 1968 by Gulf Oil.

We did complete in the early summer of 1967 a 40,000 kilowatt—a 40 megawatt plant on the system of Philadelphia Electric Company which illustrated and used the technique of gas cooling. I might say that it did so very successfully.

In the power business these days, that is a comparatively small plant, but it did illustrate the principle.

We then moved on and are building currently, some 65 percent complete, a 330,000 kilowatt plant of the same type near Denver, Colorado, on the system of the Colorado Public Service Company. Now, that plant will use the same physics and atomic principles, but its hardware will be considerably different and more nearly like we would use in the large plants. We expect that plant to be essentially completed next year and in [1248] commercial operation the first part of 1972.

Very recently, we have submitted a proposal for an 1,100 megawatt, 1,100,000 kilowatt plant up in Oregon to the Eugene Water Board. They have also received bids from the four light water manufacturers, and those bids are currently being considered. If we are a successful bidder, that will be our first large plant.

Q Mr. Gamble, if I may interrupt, if you know, approximately—you referred to an 1,100 megawatt station in Oregon. What would a comparably-sized coal-fired plant consume in coal?

A Well, a thousand megawatt plant consumes roughly 2½ million tons a year on about an 80 percent load factor basis. Eleven hundred would take 10 percent more than that. I would say 2,750,000 tons.

[1249] Q Can you go up the scale in direct proportion, that is, a million killowatt station would consume 2.5 million tons of coal, and therefore a 2 million kilowatt station—

A That is a straight line law, yes.

Q (Continuing)—would consume 5 million tons of coal?

A Well, I was talking, I'm afraid, when you were asking your question, so I didn't get the 5 million as fast as you did.

Q Would a 2 million kilowatt station consume approximately 5 million tons of coal?

A That's correct, yes.

Q Is Gulf working in the development stage or otherwise on a reactor other than the high-temperature gas-cooled reactor?

A Yes. We are currently right far along, at least with all the preliminary work, on a gas-cooled fast breeder reactor, which will be the next generation of reactors after the so-called thermal reactor, and we believe we have a very effective principle, and we are hopeful of seeing that developed in due course.

Q Can you tell us briefly, without going into too much detail, say, the most significant aspect of the [1250] gas-cooled fast breeder reactor under development by General Atomic?

A The most significant feature is this, that since we have no water in our reactors at all and since we have no sodium or any other material except gas, our fast neutrons are able to stay fast and do a very thorough job of reacting with other atomic particles and consequently performing the breeding function, which means that we can produce in our fast gas-cooled reactor, we expect to produce, 155 percent as much fuel as we burn. The other reactors in the field are not able to come up with that ratio of reproduction because they have more things within them which slow down the neutrons.

Q In other words, this breeder reactor will produce approximately 1.5 times the amount of fuel that it consumes?

A It will fuel itself again and give you enough to charge half of another reactor.

Q Mr. Gamble, without asking you to be too much of a salesman, could you tell me briefly what benefits the high-temperature gas-cooled reactor that you have already built and have a proposal in, what advantages that has over the pressurized water reactors [1251] and the boiling water reactors?

A Well, there are fundamentally two. The first is that we, since we are at high temperature and high pressure, we have the same thermal efficiency as a high

pressure, high temperature fossil fuel plant, which now is the end of many years of industry experience, and, consequently, those plants now are very efficient, and by that more of their heat is converted into electricity and less of it goes into the cooling water.

[1252] Now, our atomic reactor, the high temperature gas-cooled reactor, does not reject any more heat to the river or require any more condensing or cooling water than does the fossil fuel plant. Unfortunately, in the water reactors, they are not able to go to that high temperature and high pressure, and consequenly they have a lower over-all efficiency, which means that they do reject to the river at least a third, almost 50 percent, more than we reject to the river or that a fossil fuel rejects. By "rejecting", I mean that they put that much additional heat into the circulating water that is used to condense the steam after it goes through the turbine, which is just part of the steam power plant cycle. Now, that is one.

Now, the other one, which I think is really more significant, is that we do not use a large charge of uranium 238 and uranium 235 as do the water reactors. They generate plutonium. When you take—let me backtrack a second.

Uranium in nature is about 99.3 percent uranium 238, and only about seven-tenth's of one percent uranium 235. Uranium 235 will fission, split, send out neutrons, whereas uranium 238 will not, and the water reactor, when the uranium 235 atom splits, some of [1253] those neutrons split other atoms, releasing heat and continuing the reaction. Others of them hit and stick, you might say, in the uranium 238 atom and make it uranium 239, and after it goes through certain of its own little stunts, it turns itself into plutonium 239, and plutonium 239 is fissionable, and that is where the breeding—there's a breeding takes place in all reactors.

Now, you do not call it a real breeder until it makes more than it consumes, but in the water reactor, they make plutonium, which is really best used in a fast reactor and not best used in a thermal reactor. It can be used there.

In our reactor, we do not use a great quantity of this uranium 238. We use enriched uranium 235 and a great quantity of thorium 232, and when one of these electrons, neutrons, hits the thorium 232, it converts it into uranium 233, picks up one, 233, which is a very fine atomic fuel, a better reactor than the uranium 235. Now, neither uranium 233 nor plutonium appear in nature. Those are man-made, and they are made in these reactors, and we have a better fuel that we can make in uranium 233, which is applicable to be used in other thermal reactors, has not got the [1254] weight for the fast breeder to come along to use up the plutonium. Now, plutonium is going to be used in thermal reactors, I'm very sure, but it is not a simple process. I hope that's not too technical.

[1255] Q So that I understand, the second significant aspect of the high-temperature gas-cooled reactor is that it is a better breeder or a more efficient breeder of additional nuclear fuel than the water reactors.

A The thermal reactor, our high-temperature reactor is what we call an advanced converter because it does make some 75 to 80 percent as much fuel as it burns, whereas a water reactor makes something less than 60. I don't know what the—

Q To sum up the first significant aspect that you mentioned of the high-temperature gas-cooled reactor, its thermal pollution, if you will, aspect is no different than the thermal pollution aspect of a similar sized fossil or coal-fired plant, is that correct?

A That's correct. The high-temperature gas is the same as the fossil.

Q Mr. Gamble, has Gulf Oil been engaged recently in a survey or study with respect to the future demand for oil by electric utilities?

A Yes. Somewhat informal, but it is being carried on.

Q Did you participate in that study?

A Yes, I did.

[1256] Q Could you tell me what the results of that study were?

A I'd rather give a little fuller outline. They came to us because—

Q I am sorry, sir. "They" being who?

A Gulf Oil came to General Atomic because we do have this commercial department, you might say, that has good contact with utilities, and of which I am a member, and it's the reason I'm here, frankly, and so I was asked to participate in that study, and we did that by calling up and contacting and visiting, in several cases, various people in the utility business in the larger companies who happen to know pretty well, and find out from them what their current thinking is about the consumption of oil.

As a matter of fact, some surveys have indicated the consumption of oil by utilities was going to be on a downgrade, a negative tangent, but at least two of these people who had participated in the survey, as a matter of fact, said that they were sorry to say the survey was out of date even before it was published, and that things had changed markedly since that time, and that they were very much interesting in getting, if they could, low sulphur residual oil to burn in large [1257] quantities, on account of the impact of the air pollution regulations on the burning of coal.

THE COURT: Would now be a good time to take a five-minute recess?

MR. HEDLUND: Fine, your Honor. Yes.

THE COURT: All right. We will recess for five minutes.

(There was a short recess, after which the following further proceedings were had herein, to-wit:)

THE CLERK: Case on trial.

THE COURT: You may proceed, Mr. Hedlund.

MR. HEDLUND: May I have the last question and the last portion of the answer read back, please.

(The record was read by the reporter.)

BY MR. HEDLUND:

Q Mr. Gamble, based upon the information obtained as a result of the survey, your participation in it, are you able to predict what the future demand for oil will be by electric utilities in this country?

A That's a pretty big order. All I can say is this, that there is going to be a great deal more demand for residual oil in the next few years than even as much as one year ago we would have anticipated. The demand [1258] may not be met, there may not be enough residual oil available for the utilities to get all they would like to have, but we do know that the air pollution restrictions on burning coal, and most of the coal is high sulphur coal, has got the utilities in a bind where they will have to burn oil until they can get some of the SO, devices working, and that's not on the immediate horizon. [1259] Q Would you be able to quantify, assuming that this demand is met, the amount of oil you think will be consumed by electric utilities on an annual basis?

A You have to recognize this is pretty much of a guess, but I think I know the order of magnitude.

Q If you could just give us that.

A The order of magnitude will be somewhere between 300 and 500 million barrels, let's say with a ceiling of a billion barrels.

Q Do you know offhand what the coal equivalent of a million—did you say 100 million or 1 million barrels?

A Ceiling would be a billion.

Q A billion barrels?

A A billion barrels, yes.

Q Would you be able to compute the coal equivalent of that just in an order of magnitude?

A The other day I took a look at 300 million tons of coal, which is roughly the coal consumption now, and that came out to be something under 2 billion barrels, and I also put that against the amount of oil that may be in the Alaskan oil fields, and if we would be burning 2 billion barrels of oil a year, we could burn up all the oil that is believed to be in those reserves in a [1260] matter of definitely under ten years, so it is not an infinite supply of oil.

Q Mr. Gamble, based upon your experience with Union Electric, I would like to ask you some questions about the coal purchasing policy of Union Electric and utilities in general.

With respect to the coal supply for large power plants, for new power plants to be constructed, is that supply likely to be contracted for from the output of one, two or three or more mines?

A It's apt to be contracted for from the output of one mine, although it is possible it could be two, but fundamentally one mine would be most apt to get the contract for a unit.

Q Why is that, sir?

A Well, because both the coal mining business as well as the power business these days are mass production operations, and you build a million kilowatt machine or even a 500,000 kilowatt machine, you build a very large machine, and a 500,000 kilowatt machine will take about a million two hundred fifty thousand tons of coal a year. That takes a lot of trains of coal, and consequently you have to go to a big operation to produce that kind of coal. We bring a trainload of [1261] coal into our Sioux Plant every day from a mine, I think it is roughly a hundred cars. So, it's a mass production deal and a mass consumption deal at the utility end.

So, when you are preparing to build a plant, a new plant with large units, one of the first things you have to do is to find out where you are going to get your coal and what type of coal that is going to be, so you know best how to design your equipment.

So, it has become within the last decade, certainly more intensively as about the time that I was retiring than it had ever been before, a big business, because we have to buy, and do buy, 20, 30, as many as 40 million tons of reserves at one swipe.

Q Prior to the construction of a new power plant, how far in advance does a utility typically arrange for its supply of coal?

A Oh, I'd say a couple of years, long enough so you know what you are going to do, and when you go out for your boiler bids, that you will know what you are going to buy, so at least two years before you start your plant you ought to have a pretty good line on your coal.

Q Let me rephrase the question, because I think you may have misunderstood me.

[1262] What I am trying to get at is, prior to the construction of the power plant itself, how many years' supply of coal is normally contracted for before that plant becomes operable.

A I would say that you would not want to contract for less than a 15-year supply. Many times it's done for ten, but 15 years—and frequently those contracts will carry an option by the purchaser to renew for a period of 15 years. So, you could potentially have a 30-year supply, which incidentally would represent about twice as much value in coal as the whole power plant costs.

[1263] Q In negotiating for new coal contracts, what does a utility normally require with respect to the reliability of the coal supplier and the reserves available to that supplier?

A Well, as I said you're in big business, and you have great responsibilities of keeping that power plant running and turning out electricity to supply your customers, so consequently you do everything you can to see that you have the highest integrity type of supply. That means not only expertise in the business of producing coal, but also financial stability and also a good reputation for having been able, labor problems and other things, to live up to your commitments in the past.

Now, that's background, but then you've still got to have the amount of coal in the ground that is required to take care of the type of an obligation I've been speaking to. In other words, you've got to be able to sell coal that's in the ground, and whether you can produce a certain rate doesn't mean much, as long as it is big enough to take care of this plant, but you've got to have the coal in the ground that you are in a position to mine to supply that plant for the "X" years that you contract for.

Q Mr. Gamble, in terms of the responsibility [1264] for buying coal by a utility, is this a low echelon or a medium echelon or a top echelon management responsibility?

A Well, I'd say that it's medium to top. Some of the detail work, of course, is done by people further down the line, but it would be a very responsible department head. In the days when I was, say, broadly responsible for our coal purchasing, Mr. Covell, who is a very responsible and a very well paid man, was in charge of that among his other duties, and he was an expert on the subject of buying coal. Now, he had a certain amount of supervision from me, and we were both responsible to the executive committee and ultimately to the Board of Directors for such things as very large contracts. If you sign a contract for $130 million, why, you want to have a pretty good company feel of that before you undertake to do so.

Q Would you give me, Mr. Gamble, sir, your opinion with respect to the bargaining power that a utility has in negotiating contracts for the supply of coal?

A Anytime that you are in a position to sign up over a period of 15 or 20 years for a block of business between $50 and $100 million, you've got power [1265] in the market, and the coal producers can get hold of a large contract, which would run over a number of years, why, they know what they can do, they know what they can afford to do in the shape of opening mines and buying machinery, and it's a very important thing to them.

Consequently, there is great economic power in the hands of the coal purchaser.

[1266] Q Mr. Gamble, I show you what has been received in evidence as Defendants' Exhibit 102, which is a report of the National Fuels and Energy Study Group to the Committee on Interior and Insular Affairs of the United States Senate, dated 1962.

If you will, please, turn to page 274 of this document. With respect to the matters set forth in paragraph 1 on page 274, Mr. Gamble, I would like to know whether you agree or disagree with the following statement, as of 1962:

(Reading.) "Competition among fuels is a complex of economic, technologic and political forces. The three fuels, coal, oil and gas, compete with one an-

other for the electric energy, space heating and process heat markets. Electric energy, including hydro power, then competes with coal, oil and gas for parts of these same markets."

A That was certainly true in 1962 and partially true today.

Q In what respects is it only partially true today?

A Well, we have other competitors. We didn't think about in 1962—we didn't really realize in '62 [1267] how much competition there would be shortly from the atomic plant.

Q Would you please turn to page 289 of this document.

A I have it.

Q In the second full paragraph on that page the following is stated:

(Reading.) "The power generation market is probably the best mirror of what happens in inter-fuel competition. Minor differences in delivered price multiplied by very large quantities can amount to large sums of money to the user. Costs associated with utilizing fuels, handling, storage and entry facilities, also are large. The electric utilities are among the most well-informed buyers of energy and the quickest to take advantage of price differentials and changes in technology of utilization. Since electricity can be generated equally well by gas, oil or coal, no single fuel has an impregnable position in this market."

Would you agree or disagree with the portion I just read?

A That's correct.

[1268] Q I am sorry, sir.

A That's correct.

Q You would agree?

A None of them have any lock on the market.

Q Mr. Gamble, I show you what has been received in evidence as Defendants' Exhibit 150, which is an excerpt from the National Power Survey, a report by the Federal Power Commission, dated 1964 and published by the United States Government Printing Office.

First, Mr. Gamble, were you involved and, if so, to what extent, with respect to this National Power Survey?

A When this National Power Survey was started, I was requested by Mr. Swidler's office to be a member of the committee from the power companies who made a contribution to this study for the purposes of having the staff of the commission basically put together the final report, and I did work on that for the period, I imagine, about two years. I was chairman of one of the sub-committees on peaking, let's call it, and I was a member of, oh, four, five or six various committees in the some 17 or 18 various sub-reports that were as parts of this study.

[1269] Q Would you turn to page 54 of this document, please.

A (Witness complying.)

Q With respect to the second sentence in the first paragraph on this page, which reads as follows:

> "Just as nuclear technology is shooting at a continually moving target and attempting to overtake conventional steam electric generation, nuclear technology in turn is expected to set a continually lowering cost target which the fossil fuels and their modes of transport will be forced to meet."

Do you agree or disagree with that statement?

A I agree with it.

Q Turn, please, to the preceding page of this document.

A (Witness complying.)

Q In the first full paragraph on the page, the following is stated, and I will in reading it make an amendment to it which I am sure you will notice as I go.

> "In determining the type of fuel to be used for electric generation, there are a number of factors to be reviewed and evaluated. [1270] Each of these has a bearing on cost and influences the degree to which an electric utility is able to meet its obligation to provide reliable service at a reasonable price. The cost of storing, handling and in some instances disposing of the fuel product are economic factors

which can make a low-cost fuel the most expensive fuel. In locations where land costs are high and areas heavily congested, these costs become a major consideration in selecting a proper fuel. In some areas, operating conditions such as air control regulations may justify a premium fuel. Therefore, while a general picture can be drawn concerning the availability and price of fuel, the final determination in selecting a fuel or fuels for a particular plant must be based on the specific facts pertinent to that plant and its location."

Mr. Gamble, would you agree or disagree with the statements contained in this report as I have just read them?

A Yes. I think that is certainly true.

Q Mr. Gamble, were you aware, I believe it was [1271] in 1968, of the proposal made by Humble Oil to sell coal to the Union Electric Company?

A I am not sure I was acutely aware of it at that time. I probably heard of it, but I do not recall at the moment that I did.

MR. FUTTERMAN: Your Honor, I would like to make a statement for the record at this point.

As you know, the Pretrial Order No. 2 called for defendants to submit to the Government the expected testimony of the witnesses who would appear at the trial. I believe, although I haven't made any objection, that Mr. Hedlund is getting into a number of areas with this witness which were not specified to us in his letter of June 6th, 1969.

This may have some bearing or effect on the length of the cross examination.

MR. HEDLUND: Your Honor, I would be pleased to get that letter. I also want to point out that Mr. Futterman took Mr. Gamble's deposition. He has talked with Mr. Gamble on numerous occasions as to what he was likely to testify to, as recently as last evening.

I do not believe at this point that I have gone beyond any of the subject matters set forth in my initial letter, with the possible exception of this [1272] present line of inquiry which I believe is responsive to information

that the Government developed with respect to the examination of Mr. Tomey.

[1273] MR. FUTTERMAN: Well, I will just say at this point that at no time during my conversation with Mr. Gamble, nor during his deposition, did matters relating to Union Electric's fuel purchasing policies or his experience at Union Electric occur. The only thing that was brought out during the deposition was the fact that he was employed by Union Electric for the period he specified.

I am not making any objection, but I would just like to—

THE COURT: All right, let's proceed.

BY MR. HEDLUND:

Q Since that time, have you become aware?

A Yes, I have.

Q Mr. Gamble, what, if you can tell me, was the proposal by Humble and what were the results of its evaluation by Union Electric?

A As I now recall it, having looked into the matter more recently—I don't recall it in 1958—they offered to supply coal for our Labadie 2 unit. That was more recent than 1958, though.

Q I thought I said 1968.

A 1968. I realize I am wrong there.

In 1968, which, of course, was after my [1274] term of office with the company, but as a director I would have an opportunity to hear about it at least.

The proposition which I have recently learned consisted of supplying or offering to supply a full-fledged million and a half tons a year over a period of I think it was 20 years of coal from their mine up in the Springfield area.

Now, there were three things in the analysis which militated against that contract. The first is that it happens to be particularly high sulphur coal. Most of our coal we think of in terms of 3.4 to 3.5 percent sulphur. As I understand it, this coal was 3.5 to 4 percent sulphur which in these days and times is a pretty bad start.

Furthermore, it is very low BTU per pound, only 9,500 BTU per pound as against ten-five or eleven of most of the coals we get, and twelve and twelve-five for real good coal which we don't burn much of. But 9,500 is a very low BTU which means there is a lot of ash that has to be handled, because what is not burned is left over to handle through the ash disposal system.

Furthermore, they were handicapped by not having a single rail line haul into the plant. They would have to trans-ship it on a second road.

[1275] Now, there is some advantage to some diversity on railroad supply on account of wrecks and other things, but not when it amounts to a very substantial increase in the freight rate, which in this case it did.

So, the end product was that these people had a coal that was too high in sulphur, that was a poor coal from the point of view of BTU content and consequent handling and burning, and the price was too high. So, it was a very simple decision that they were not going to get the business.

* * * *

CROSS EXAMINATION

BY MR. FUTTERMAN:

* * * *

[1278] Q You testified that a utility has bargaining power in buying coal. Would it be your testimony that utilities have an unfair bargaining power over the coal producers?

A No, absolutely not.

Q Would your opinion be that the bargaining power is relatively equal?

A Yes. There are a number of strong producers of coal. They confront, the utilities, I say, across the buying or bargaining table both with great strength.

Q Is it to the advantage of the utilities to have a number of strong competitive coal producers soliciting their business?

A Yes, it is.

Q Do you believe that Union Electric as a utility

is in a better or worse or about the same bargaining position in relation to the coal producers as TVA?

A I don't see why we are in any better position than TVA. We do have and they do have, too, both a combination of rail and possible water transport. That is quite an adjunct to a competitive situation.

Q What about that same question as applied to [1279] Union Electric vis-a-vis Commonwealth Edison and the coal producers?

A I don't know that our competitive position would be any better. We ought to be able to get a somewhat lower price ordinarily because I think our freight rates to us would be lower or less than theirs, but that doesn't hold to the basic competition situation.

* * * *

AFTERNOON SESSION—2:15 P.M.

* * * *

[1325]

RECROSS EXAMINATION

BY MR. FUTTERMAN:

* * * *

Q Mr. Gamble, referring back to the area which you discussed during your cross and redirect examina- [1326] tions, that is, the area described by the Government as the Eastern Interior Coal Province Sales Area, do you anticipate that within that area in the next ten years that the total amount of electrical generation will greatly expand?

A It should follow the same law as the country as a whole would follow, and roughly each ten years the generation will double.

Q Do you anticipate, Mr. Gamble, that within that area the total tons of coal consumed will increase over the present level?

A The equivalent tons of coal will definitely go up and I would think that the present tons of coal will also go up, but we are in a transition period here when

coal is going to have a fairly rough time until these SO_2 devices get developed, and between now and the next ten years, it is not clear in my mind, and I don't know anyone else whose mind it is clear in, how the situation is going to be handled. It's really a,—well, for a man that's got to do it, it's a nightmare. You just cannot see through that maze.

* * * *

[1331] THOMAS LATIMER,

called as a witness by the defendants herein, having been previously duly sworn, was examined and testified further as follows:

CROSS EXAMINATION

(resumed)

BY MR. SIMS:

Q Back to the mines.

Mr. Latimer, UEC has listed on its reserve books approximately 5.3 million tons of deep coal at its Fidelity Mine, is this not true?

A Yes.

Q UEC may ultimately mine this coal, is this not true?

A It's possible.

THE COURT: What was the answer?

THE WITNESS: It's possible.

THE COURT: Yes.

BY MR. SIMS:

Q Mr. Latimer, UEC has attempted to acquire the Murphy tract at the Cuba Mine for some time, is this not true?

A Yes, for a long time.

Q Approximately how many acres are there in the [1332] Murphy tract?

A 193 acres.

Q You have estimated before, have you not, that there could be approximately one million tons in this tract?

A Something in that vicinity.

Q In 1969, did not UEC acquire at Cuba a portion of the Landis property?

A Yes, a small portion.

Q In 1969, did not UEC acquire at Cuba some coal at the Deakin property.

A Which property?

Q Deakin, D-e-a-k-i-n.

A Deakin, yes.

Q Yes.

Is it not true, Mr. Latimer, that at Cuba UEC has mined coal under 90 feet of overburden?

A Yes, indeed.

Q In fact, it has gone up as high as a hundred feet, is this not true?

A No, sir.

* * * *

[1340] MR. SIMS: Your Honor, the witness has testified among other things, to the fact that in January of 1970, [1341] UEC exercised its option to acquire the D. Harris property at Fidelity, which property contains approximately 1,700,000 tons of coal.

The witness also testified that these reserves do not appear on the latest reserve schedule of UEC which is dated December 31, 1969, and this property does not appear on Defendants' Exhibit 60-D.

The Government will not move to strike Defendants' Exhibit 60-D, which shows that UEC's reserves at existing mines are stated at 52 million tons, approximately, and have "a potential acquisition at UEC's present mines" of approximately 3,600,000 tons, as long as the Government will not be precluded from introducing in our rebuttal case evidence to show that these figures are not complete.

THE COURT: You certainly have that right at all times.

MR. SIMS: Fine.

THE COURT: Is there any question about the statement make by Mr. Sims here?

MR. HEDLUND: Your Honor, I am sorry, but may I have it read back? I am sorry to burden the Court with—

THE COURT: All right.

(Record read by the reporter.)

[1342] MR. SIMS: We have no further questions at this time, your Honor.

THE COURT: Do you accept it?

MR. HEDLUND: Your Honor, we will accept that, but we have some redirect examination.

THE COURT: Well, you have that right.

MR. HEDLUND: Yes.

THE COURT: All right.

MR. IRVING: Your Honor, may I have a moment to consult?

THE COURT: You may.

Well, all we are dealing with is the introduction of this document.

MR. IRVING: Yes, sir.

THE COURT: I just wonder what the redirect is.

MR. IRVING: Well, some of the redirect intends to go into the matters raised by Mr. Sims a moment ago.

THE COURT: Well, all I was dealing with was the introduction of the document here. They are not objecting to the document. The document is in evidence.

Now, I just inquire in that the direct examination was to lay the foundation for the introduction of the document, the Government cross examined to indicate whether or not the document would be admissible, [1343] and the Government now concedes that it is admissible, subject to that condition.

So, I ask, what would the redirect examination be on it?

* * * *

[1371]

IN THE UNITED STATES DISTRICT COURT
NORTHERN DISTRICT OF ILLINOIS
EASTERN DIVISION

No. 67 C 1632

UNITED STATES OF AMERICA, PLAINTIFF

vs.

GENERAL DYNAMICS CORPORATION; THE UNITED ELECTRIC COAL COMPANIES; and FREEMAN COAL MINING CORPORATION, DEFENDANTS

Before HON. EDWIN A. ROBSON, Judge,

Monday, April 13, 1970,

10:30 o'clock a.m.

PRESENT:

MR. JOHN THOMAS CUSACK,
MR. ROBERT L. EISEN,
MR. RONALD L. FUTTERMAN,
MR. HUGO SIMS, and
MR. RICHARD J. BRAUN,

appeared for Plaintiff;

MR. REUBEN L. HEDLUND,
MR. DONALD G. KEMPF, JR., and
MR. RICHARD H. IRVING, III

• • • •

[1376] MR. CUSACK: I am referring to page 1222. At that time, and it did come as a surprise to us, Mr. Hedlund asked us what the witnesses would testify to. We stated that in regard to Mr. Hooper of Ayrshire Collieries, on page 1222 we would go into those matters, and we said that it is believed that is all we would presently ask him—Mr. Eisen said, "That is

all we presently have in mind," and Mr. Cusack said, "This is all we have presently in mind."

[1377] On Friday when we had the day off, I had an opportunity to review the file we had on Mr. Hopper. I then told Mr. Hedlund, I called him immediately after I had reviewed that file, and told him that in addition to the matters set forth at page 1222 of the transcript in reference to the expected testimony of Mr. Hopper, we may possibly ask Mr. Hopper three other matters: the availability of strip and underground coal reserves in Illinois; the cost to Ayrshire of its coal reserve acquisitions; and the mineability of the Industry Field.

In regard to Mr. Shumate, your Honor, we told Mr. Hedlund and the Court at page 1223 what we would ask him there. We certainly anticipated—we said we would examine him on the future strip mining possibilities in Schuyler and McDonough County areas.

I told Mr. Hedlund on Friday after reviewing Mr. Shumate's file that in addition to the possible testimony of Mr. Shumate as set out at page 1223 of the transcript, we may possibly ask him regarding the availability of strip and underground coal reserves in the Midwest and the cost to Zeigler of its acquisition of coal reserves.

We believe, your Honor, that this does not substantially change the testimony of the witness.

• • • •

[1382] NICHOLAS T. CAMICIA,

called as a witness by the defendants herein, having been first duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. IRVING:

Q Please state your full name and home address for the record, sir.

A My name is Nicholas T. Camicia.

THE COURT: Would you spell your last name, please.

THE WITNESS: C-a-m-i-c-i-a.

BY THE WITNESS:

A (Continuing) My home address is 85 Country Club Lane, Pelham Manor, New York.

BY MR. IRVING:

Q Mr. Camicia, by whom are you currently employed?
A The Pittston Co.
Q What is your business address, sir?
A 200 Park Avenue, New York, the Pan-Am Building.
Q What is your current position with the Pittston Co.?
[1383] A I am president and chief executive officer.
Q For how long have you held that position?
A A year.
Q Would you please briefly describe the fields of enterprise and operations of the Pittston Company?
A Well, briefly, the Pittston Company is a holding company diversified into principally coal mining. We also have armoured car services through our Brinks operation. We are a fuel oil distributor in the metropolitan area of New York and New England and Canada. We also have an interstate trucking company.
Q Approximately what would the annual production of your bituminous coal be, sir?
A We are presently at the rate of about 23 or 24 million tons a year.
Q To whom do you sell that coal principally?
What type of coal is it, may I ask?
A Principally, it is about 85 percent metallurgical coal. The remaining is utility and general use coal. We sell approximately 40 percent of our production for export.
[1384] Q Mr. Camicia, could you briefly describe your educational and professional background up until the year 1965?
A I am a graduate mine engineer from Virginia Polytechnic Institute. I went to work for a coal company called Island Creek Coal Company immediately after graduation. I spent a year or a year and a half as a common laborer in order to get some experience. Then I held a job as an engineer for a couple of years, proceeding from that to a section foreman or first line

foreman, superintendent, general manager, and finally vice president of operations and then I served as executive vice president of that company and on the board of directors.

Q About what year was it that you were named to the Island Creek Board of Directors?

A I think it was 1962. And at the same time I became executive vice president.

Q Did you serve in the Armed Forces at any time during this period?

A Yes. I forgot. During that period I was off for about five years and was in the Armed Services. Part of my service was on the staff of General Eisenhower, rehabilitating the coal mines of Holland and Germany.

[1385] Q Was most of your mining experience and training during this time in deep mining?

A Practically all of it. Essentially all of it.

Q Mr. Camicia, could you please describe the nature of your experience and positions held from 1965 to the present.

A In 1965 I came with the Freeman Coal Mining Company, which is a subsidiary of General Dynamics, as executive vice president. I held that position until January 1, 1968, at which time I was made president of Freeman Coal Mining Corporation and the United Electric Coal Companies.

During the time I was executive vice president of Freeman, of course, I had mainly responsibilities in the area of the deep mines of Freeman Coal Mining Company.

Q I take it about a year ago you were named president of Pittston Company, is that right?

A Yes. April, 1969.

Q During your term as executive vice president of Freeman were you primarily concerned with the deep mining operations as opposed to the strip mining operations?

[1386] A Yes. Almost entirely. I had an occasional discussion on the strip mining operations, but I had no responsibility whatsoever.

Q During your term as president of Freeman and UEC, did you become familiar with the strip mining operations of United Electric?

A Yes, I did. I was principally interested in the operations of the pits, and I spent a lot of my time during that year as president trying to find additional reserves, strip mining reserves, for UEC.

[1387] Q During your career in the coal industry, Mr. Camicia, would you say your experience has covered all phases of the business?

A I don't think there is any question about it. At least I have covered every phase possible in the deep mining.

Q As the chief executive officer of a deep mining organization, would you please give us an estimate of about how much of your time in the past year has been spent at the Pittston mines?

A I would estimate that I have spent about 80 percent of my time since I have been with Pittston on the coal mining phase of the company.

Q Does this include actually going underground—

A Oh, yes. I have covered every section, every mine and every facet of the operations.

Q Would it be normal in your opinion for the chief executive officer of a deep mining company to spend about this much time at the mines gaining first-hand knowledge of the mining operations?

A Well, deep mining being a highly technical and very difficult operating type of business, I would say that any prudent executive must spend a great deal of his time in order to become fully familiar with the operation.

[1388] Q Could you please briefly describe the different types of operations which are included in the term "deep mining"?

A Essentially on a broad basis there are perhaps, you could say, three types of deep mining, one of which would be called drift mining.

Drift mining means that the coal seams are exposed above the water level and are uniformly flat or level. The operation consists merely of punching or going into

the mine from the outside. It is the easiest type of mining, of deep mining.

[1389] The second phase could be classified as slope mining, which is a seam of coal below the creek bed or water level. It consists of putting in a slope of about a maximum of 17 degrees with a belt to bring out the coal.

These types operations are usually limited to a maximum of about 300 feet below the surface.

Then we have what we call shaft mining or strictly deep mining, and these will vary from, say, 300 feet down to, in this country, a maximum so far of about 1,600 feet. In Europe, of course, they go down as much as 4,000 to 5,000 feet.

In this country, it is 1,500 feet. That means you must sink a vertical shaft or several of them, so that the coal is hoisted by skips and hoisting machinery and the coal is brought out in that manner.

Q When referring to slope mining, you mentioned a belt. Could you further explain that?

A The belt is merely a means of lifting the coal from, say, the 300 foot level to the surface, as opposed to hoisting it vertically. It comes up a slope on a belt, and this, of course, is a cheaper method and an easier method of extracting the coal, bringing the coal out, than the shaft type of operation.

[1390] Q Would it be in the order of a conveyor belt?

A Yes. A belt conveyor.

Q Mr. Camicia, could you please describe some of the major problems faced in setting up a deep mining operation?

A Well, a deep mining operation is a very, very difficult type of operation and highly technical. Before you can even start a deep mining operation, you must have expert knowledge and know-how as to how to explore the seam. You must drill the seam, fore-drill the seam, to try to study what type of roof you will have, the roof being the seam rock above the coal seam.

You must try to determine how much gas will be emitted by this coal seam as you extricate the coal, as

you extract it. You must determine how much water you will perhaps have in this seam, so that you can plan on the drainage of that mine.

[1391] You must determine of ventilation that is needed to neutralize or to carry away the gaseous emissions and to comply with the Federal laws.

You must determine in advance what type of mining machinery can be used or should be used.

All of these items have a sense of risk about them, because you can make one bad judgment in any one of these items and your mine could be a failure. Every deep mine that is put in is a risk proposition from the word go.

Q You mention the planning for a deep mine. What level of employee would take part in this planning?

A This would be from the chief executive officer or the top mining man in the organization down through the engineering group and the operating group. It is the top management level really.

Q Are these problems that you mentioned similar in nature to those faced by strip mining outfits?

A Absolutely not. It is just a different ball game, a different business altogether.

Q Were a strip mining operation to attempt to open a deep mine, could it adapt and carry over knowledge and expertise to the deep mine which would enable it to carry out the deep mining of coal?

[1392] A I know of no phase that could be carried over, except perhaps in the marketing and sale of the coal.

There is no correlation whatsoever between the engineering or management or knowhow or knowledge of mining.

Q Would there be any similarity in the type or nature of labor force used at the mine once it was opened?

A No. It is an entirely different thing. You have to understand that strip mining is very, very similar to construction work. It is just an earth-moving problem. You can go out and pick up any kind of construction worker and start up a strip mine. But in deep mining it is a very different business, and it takes a different type of person, even insofar as attitude.

Q Mr. Camicia, based on your knowledge as former president of both Freeman and UEC, do you know if UEC has or has had any managerial level personnel, including mine engineers and superintendents, who have had deep mining experience?

A To my knowledge, at the time that I was there there was no one that could be classified as knowing anything about deep mining.

[1393] Q Based upon your knowledge and experience as former president of UEC and Freeman, and based upon your knowledge and expertise as a deep mining engineer and executive, do you think that it is likely that United Electric could make a successful grass roots entry into deep mining coal. By "grass roots," I mean an entry made through internal expansion rather than affiliation with a deep mining company.

A I don't see how it could possibly at all. I don't see how they could even make a start at it. It would be very difficult to even get any notion to try to do it.

Q What factors lead to this opinion, sir?

A Well, because I know the technical requirements of opening up, developing and operating a deep mine. The problems are so different as compared to the strip mining and so foreign to strip mining that it is just a different business altogether; because they are in the strip business would give them no reason whatsoever to think they could go into the deep mining business, no more so than—and I presume you are not a miner—no more so than you could go into the deep mining business.

THE COURT: You would be surprised at how versatile [1394] some attorneys are.

MR. IRVING: I will stipulate I am not a miner, your Honor.

BY MR. IRVING:

Q Do you know, from your experience, if the availability of qualified deep mining personnel—and I am including all levels now—is greater or lesser than those equivalent level personnel for strip mining operations?

A Yes, I guess I could be classified as an expert on that, because—and it is a good thing for we mining

engineers that there is a great, great scarcity of qualified managerial people in the deep mining, and there has been for a number of years.

[1395] The situation now is even worse and more critical, as a matter of fact.

Now, insofar as strip mining is concerned, and during my tenure as president of UEC, I had no problem going out and finding people, because I could go to a good construction job and pick up a pit foreman or a maintenance foreman that knew how to run trucks and take care of them. But to get a good foreman or superintendent for deep mines is entirely a different situation.

Q Mr. Camicia, from your personal experience do you know of any strip mining firm which has made a successful grassroots entry into deep mining in, say, the last 20 to 25 years?

A I know of none. I can only recall several years ago that Kennicott, who is a company that I think is principally in metal mining, copper mining, and so on, approached me to try to help them get into the coal mining business, the deep mining business. They had a number of what they called deep mine reserves, and they were trying to get into the business by employing someone like me to build up an organization and to try to get started.

I rejected the job. I advised them that [1396] it would be almost an impossibility to try to get into the business in that manner and suggested that they go out and try to acquire the management by acquisition. I think they did that. Peabody.

MR. IRVING: The defendants have no further questions at this time.

THE COURT: You may cross examine.

CROSS EXAMINATION

BY MR. EISEN:

Q Mr. Camicia, isn't it a fact that one of the reasons for the shortage of technically qualified help in underground mining is due to the fact that the coal industry

was depressed up until about 1960, which led to few people becoming interested in that field?

A I think you could say that that is one of the factors that perhaps kept young men from going into college and studying mine engineering, because the opportunities were not great.

Q Following 1960 the future of coal became much more optimistic as a successful enterprise, did it not?

A No. That is not true at all. From 1960 to 1968 is probably one of the worst periods in the coal business that you have had.

* * * *

[1398] Q Are you aware of the fact that Peabody has been retraining some of its strip miners to work in deep mines?

A No, sir, I am not.

Q Haven't other companies been doing this?

A Not that I know of.

Q You mentioned the similarity of deep mining and strip mining at least to the extent of the marketing of the coal, did you not?

A Yes, sir.

Q Would it not also be true that there was a similarity insofar as the processing of the coal is concerned and the exploration for reserves are concerned?

A Well, you are putting two things together. Let's first talk about the processing of coal, if you wish. There is some similarity between the processing of coal, but I included that with marketing. That is part of marketing. That is the processing and marketing and sale of coal.

But insofar as exploration work, there is very little similarity in that the only similarity is that in both cases, you find out whether there is coal there. But how to analyze what you have seen, that takes an expert in deep mining to determine whether that coal [1399] is minable by deep mining methods.

The strip miner can only determine whether it is minable by stripping methods.

Q You are aware of the fact, are you not, that UEC

acquired deep mining coal reserves some years prior to your coming with the company?

A Yes, I knew that.

Q Did they continue to acquire some of those reserves during your association with the company?

A Not while I was associated with them. As I said, we were looking for principally strip reserves for UEC during my tenure as president. I must say that during that time, I had a blank check from General Dynamics to get whatever strip mine reserves we could possibly find. I used every person available on this proposition.

Now, in looking for strip mining reserves, some of them are connected with deep mine coal. You cannot in certain instances accept or get strip coal without accepting responsibility for buying the deep mine portion of those reserves.

Q But you did learn, did you not, in the course of your association with UEC that they had acquired approximately 50 million tons of deep reserves at Round Prairie?

[1400] A Yes, sir. I knew that we had those reserves.

Q When did you first hear of the Round Prairie Field?

A Not really until I became president, which was the first of January 1968.

Q Did Mr. Nugent tell you why UEC had acquired Round Prairie reserves?

A I don't recall that he did.

Q Did you have any discussions along that line?

A After I became president, we had some discussions as to the possibility of mining these reserves. We had some feasibility studies made on it and some market feasibilities. It proved that it wasn't the right vintage yet, meaning that it may be mined someday, but it certainly wasn't time yet because of the market conditions.

Q Did you say that you had some feasibility studies made?

A Yes. On my own, yes.

Q What did those feasibility studies consist of?

A It consisted of studying the bore holes, determining what type of top there was, what the height of the coal was, what the quality of the coal was, what the drainage problems would be, what type of operation [1401] would be required to extricate the coal, what type of machinery would be required to mine the coal, what the capital costs were, and what the cost of mining would be, all of which proved that the coal could not be mined at a profit.

* * * *

[1418] "Q Mr. Camicia, assuming that a company owns or controls 100 million tons of underground coal, that such coal may be mined at a profit, either now or within the next 10 years, and that company is experiencing in processing, shipping and marketing of coal in the area, and that you have six [1419] to eight million dollars cash—given these facts, would it, in your opinion, be possible to hire competent personnel to put in a slope mine costing approximately six to eight million dollars?")

THE COURT: Now, do you recall the other question?

THE WITNESS: No, your Honor. I would like to have it read.

THE COURT: Read the question.

(The question read by the reporter, as follows:

"Q Does the foregoing hypothetical that I have given you apply, would you say, to United Electric as you know it, with regard to its financial position and its reserves?")

BY THE WITNESS:

A Well, to answer the first question, I don't think it is possible for the hypothetical company to do as you have so indicated.

Secondly, United Electric Coal Companies certainly was not in a position to go into a deep mine venture.

* * * *

[1422] BY MR. EISEN:

Q You do not know, do you, Mr. Camicia, whether had UEC not become affiliated with Freeman, it would

have gone into the underground mining business?

A I don't know the answer to that.

Q You cannot answer that?

A I would just have to guess.

Q It might have gone into the underground mining business had it not been associated with Freeman, is that right?

A Had they not been associated? I don't know that. All I can say is they would have made a mistake if they had tried it.

Q Are you aware of the fact that Carter Oil Company, an affiliate of Humble Refining Company, has gone into deeper mining in Illinois, is going into the deep mining business?

A Yes, sir, I am aware of that.

Q Are you familiar with the particular reserves they are developing?

A Yes, sir.

Q What is the seam thickness?

A About five feet.

* * * *

[1423] Q And it is a fact, is it not, that Humble, to your knowledge, has never been in the underground mining business?

[1424] A To my knowledge they have not been in the underground coal mining business.

Q So that would be one company that would be an exception, would it not, to your statement, if you want to call it an exception, that it is difficult if not impossible for someone inexperienced in underground mining to go into that business?

A I don't know that it is an exception yet, because, as you might say, the jury is still out.

Q But you do know that this company has contracts to supply Commonwealth Edison with three million tons a year at its Powertown Station?

A Yes, sir, I know that.

Q Are you familiar with the Inland Steel Mine?

A Yes, sir.

Q When was that developed?

A Perhaps starting in 1968, something like that, I believe.

Q Who developed that particular mine?

A Inland Steel's coal mining operation group.

Q When did they first go into the coal mining operations?

A Possibly 50 years ago.

Q Where was their mine located?

[1425] A Wheelwright, Kentucky.

Q Where is that?

A Wheelwright, Kentucky. That is in eastern Kentucky.

Q What part—

A In the United States.

Q Pardon me?

A I said eastern Kentucky, in the United States.

Q Do you know whether or not they brought their personnel from their eastern Kentucky operation to open up their Illinois mine?

A Yes, they did.

* * * *

[1427] Q Are you familiar with the Parton Coal Company?

[1428] A What is that?

Q Parton, P-a-r-t-o-n.

A No, I am not.

Q There are, are there not, smaller companies than Freeman in underground coal mining in Illinois?

A Certainly there are, because they are No. 1. If there are any more of them, they have to be smaller.

Q About how many would there be?

A I would guess five or six or seven companies.

Q How large an operation would you say an underground mining company would have to have in order to have the know-how to open up a new mine of, say, one million tons production a year?

A I don't know that there is a definite figure, but I would say it should be in the neighborhood of five million, four million tons plus, before they could support the proper staff to do the work.

Q When you say five million tons, you are not talking, are you, in terms of technical know-how? You are talking in terms of financial resources, aren't you?

A What I am trying to say is that it takes a certain amount of business to support a staff large enough to do your work. That is what I am trying to say.

Q My question was not clear. I am sorry. I [1429] wish you would apply this to United Electric. Assuming that you do have a large corporation already engaged in strip mining, about how large a company would they have to acquire in order to acquire the technical know-how to open up, say, a slope mine at Round Prairie?

A I understood your question and my answer was four to five million tons.

Q What is there about the extent of that operation, the four to five million tons, which is necessary to acquire the know-how to open up a deep mine?

A I will answer that again. In order to do business, which apparently you do not know too much about, you have to be able to support a staff. You have to be able to make money so you can have staff that has the knowledge. You can't have a dog hole and have sitting on the staff three or four vice presidents of engineering and maintenance, and so forth. You have to be big enough to have a staff that can support you.

* * * *

[1439] Q You did not attempt to acquire any reserves in LaSalle County?

A Where is LaSalle County? Orient me. I am not that familiar with this state. I am a newcomer here.

Q That is in the area of—

THE COURT: Indicate on the map to expedite it.

THE WITNESS: Show me about where it is.

BY MR. EISEN:

Q It is in central Illinois.

A Near what city?

Q Well, let me ask you this, Mr. Camicia. What counties in the state did you have your people explore in for coal reserves?

A My instructions—

MR. IRVING: Your Honor, I think it is unclear to me at any rate, and perhaps it is to the witness, too, whether Mr. Eisen is speaking of acquiring reserves for UEC or Freeman or both.

THE COURT: Would you specify, Mr. Eisen?

BY MR. EISEN:

Q For UEC.

A My instructions to my staff was to find any reserves they possibly could in the State of Illinois, Indiana, Missouri or any place else in the United States [1440] that could be stripped for UEC. We had a team that searched all over the country. I don't know which counties they went in, which counties they did not go in, but we looked at every possible area in Illinois where there are strip reserves that could be available.

Q What were your instructions to them insofar as the quality and quantity of reserves they should look for?

A I didn't even put any reservations on it. I just said find some coal that could be stripped, and then I would decide whether it was worth buying or not. Anything that can be stripped, just so it is black. That is really my instructions to them.

Q To whom did you give these instructions?

A I gave them to Burl—I can't remember all these guys' names now, but one was Burl Jensen, who is the company geologist. I gave the instructions to Peter—the chief engineer, Peter Spartan. I gave the instructions to Tom Latimer. I also gave instructions to three people in Freeman to help United Electric look for strip reserves. They were Jack Madsen, Bill Mullins and Tom—I can't remember his name, but he was an engineer with Freeman named Tom, an older fellow.

Q Did they ever report back to you any specific [1441] reserves that you can recall, any particular fields they found?

A Yes. They found a field in central West Virginia called, what I call, the LaRosa property. They had some potential of strippable reserves, but it was tied in to deep mine reserves, and the study of the overburden and the quality of the coal was such that you just couldn't make a profit of it, so we just let it go by the

boards. It is still sitting there if anybody wants to buy it.

Q Did they report any strip reserves to you in the State of Illinois?

A Only very small patches of contiguous reserves that we tried to get and in most cases were unsuccessful.

Q You did not have them look for any deep reserves?

A You asked me about UEC. Now you are asking me about Freeman?

Q While you were at UEC.

A I did not have UEC looking for deep mine reserves, no.

Q Where would you draw the line between a deep mine reserves, sir, and underground?

A Well, it depends on a lot of things, but in [1442] general you can say about a hundred feet. If the overburden is not solid rock. But if it is solid rock you couldn't even afford to go that high.

* * * *

[1444] Q Would you say that a man whose experience had been exclusively in deep mining could successfully run a strip company?

A After a short period of training, yes.

MR. EISEN: I have no further cross, your Honor.

THE COURT: All right. Any redirect?

MR. IRVING: Your Honor, may I have a moment to consult?

THE COURT: You may.

(There was a brief interruption, after which the following further proceedings were had herein, to-wit:)

MR. IRVING: Thank you, your Honor.

THE COURT: All right. You may proceed.

REDIRECT EXAMINATION

BY MR. IRVING:

Q Mr. Camicia, during the course of the cross examination, you referred occasionally to what you called a dog-hole mine.

Could you please define for us and for the Court what you mean by a "dog-hole."

A Well, it is a general term used by coal mining people, meaning a very small operation, employing perhaps less than 20 people, usually a family-run organization [1445] that produces up to, say, from 100 to 200 to 300 tons per day.

Q How long do these dog holes generally stay in operation, if you know?

A Usually a dog hole is good for maybe six months or a year. Then they get their house so dirty, they have to move rather than build a new house.

Q Could such a mining operation as you have described and defined as a dog hole support a modern long-term contract business in the coal industry?

A Oh, certainly not. Any customer that would consider a dog hole as a source of supply—well, they just couldn't do it. They may get it on a spot basis temporarily in an emergency, but they certainly wouldn't make a long-term contract with anybody, I don't think.

Q Sir, when you stated that there were, I believe, five to seven companies in Illinois who are deep miners smaller than Freeman, did that include any companies which you would consider to be dog-hole operations?

A No, sir. I wasn't thinking in those terms, no, sir.

MR. IRVING: We have no further questions, your Honor.

[1446] THE COURT: Any recross?

MR. EISEN: No, your Honor, except may the record show that there has been an extensive deposition with Mr. Camicia's testimony on some of the same subject matters.

THE COURT: All right. Thank you, sir. You are excused.

THE WITNESS: Thank you.

(Witness excused.)

THE COURT: You may call your next witness.

MR. KEMPF: Your Honor, can we have about a five-minute recess?

THE COURT: In other words, you want to recess until 2:00 o'clock?

MR. HEDLUND: Well, no, your Honor. If we could have about five minutes—

THE COURT: All right. We will take a five-minute recess.

(There was a short recess, after which the following further proceedings were had herein, to-wit:)

THE COURT: Are you ready to proceed?

MR. KEMPF: Yes, your Honor.

THE COURT: You may call your next witness.

* * * *

[1448] SAMUEL F. SHERWOOD,

called as a witness by the defendants herein, having been first duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. KEMPF:

Q Please state your full name, sir, and spell your last name.

A Samuel F. Sherwood; S-h-e-r-w-o-o-d.

Q What is your home address, Mr. Sherwood?

A 1221 Golden Hill Drive, Indianapolis, Indiana.

Q By whom are you employed, sir?

A I am employed three ways. I am president of the Calvert Youngblood Coal Company. I operate an independent consulting firm by the name of S. F. Sherwood & Associates. More recently, I have become vice president of Empire Energy Corporation, which operates a small drift mine in Colorado.

Q Could you describe for us Calvert Youngblood Coal Company's operations.

A It is a strip mine operating about an 18-yard shovel, mining very high quality coal, thin seam, overburden running up to about 80 feet. The coal almost [1449] exclusively goes into the metallurgical market to make foundry coke.

Q How long have you been in the coal business, Mr. Sherwood?

A Well, I have been in the coal business all my life. My father started mining in Danville, Illinois, in 1918. After graduating from Harvard and serving four years during World War II in the Navy, I went into the coal business with my father, which by then had developed into the Stonefort Coal Mining Company, and worked for it until its sale to Peabody in 1966.

Q Could you please speak up a little louder so that all counsel can hear you.

A All right.

Q What was your position with Stonefort at the time it was sold to Peabody Coal Company?

A I was president of the corporation.

Q What properties was Stonefort operating at the time it was sold to Peabody?

A The company operated the Will Scarlet Mine in Saline and Williamson Counties, Illinois, which is in the southern Illinois freight district, and the Allendale Mine in Stark County, Illinois, which is in the [1450] Fulton-Peoria freight district.

Q Mr. Sherwood, did any of Stonefort's mines reach the end of their mine life while you were active in the company's management?

A Yes. Prior to the Allendale mine, we had a mine known as the Little John mine in Knox County, Illinois, just west of Peoria. It did reach the end of its reserves.

Q What, if any, marketing problems did the mine face as its reserves neared exhaustion?

A Well, we had a number of problems, most of them in keeping customers and finding replacements for those that were lost. The word got around that we were on our last few years. We had no success, obviously, in making any long-term contracts which were coming in with utilities. Even the regular year-to-year customers with which we had had good relations began to fall off. We really had to resort to lowering our price and struggling along as best we could, which gave our last few years a pretty tough financial situation.

[1451] Q Did this affect not only yourself but also your customers?

A Yes, yes. If we had had the reserves, we could have continued to service them. Instead, we could not.

Q Did you have any other mines which experienced similar difficulties?

A Well, a year or two later, our Sherwood-Templeton operation in Indiana, this mine approached the end of its reserve life. It had only a couple of years to go. In that case, with the experience of our Little John operation, we arranged—we made a sale eventually of that mine as a going property to Ayrshire Collieries which had adjacent reserves. They took over our customers, took over the mining operation and continued that operation. As it petered out, as the reserves that we had petered out, they just carried on with their own reserves, and they are still operating.

Q Was that a benefit both to that particular mine and to the customers in your opinion?

A I think so.

Q For what reasons?

A Well, they had a continued supply of coal from the same region. So much of the business, particularly in the utility field, is becoming long term. These [1452] utilities had the knowledge of where their coal was coming from, whereas in our situation prior to selling to Ayrshire, we just were unable to give them the confidence of continued supply that they would have liked.

Q You mentioned that at the time Stonefort was sold to Peabody, you were operating the Will Scarlet Mine in the southern Illinois freight district and the Allendale Mine in the Fulton-Peoria area.

Was the coal mined at Stonefort's Will Scarlet Mine in southern Illinois similar in its characteristics to that mined at the Allendale Mine in Fulton-Peoria?

A No, it wasn't. They were very dissimilar. The Will Scarlet coal was about 2,000 BTU's greater. It had very low moisture versus high moisture at Allendale. Its sulphur was different. The amount of ash and the flagging characteristics, fusion and all this were dissimilar.

Q Are these differences between the two coals a factor in marketing coal?

A Yes, they are. Practically any large customer or small customer, I presume, designs its boilers for the expected type of coal that it expects to burn. If [1453] they attempt to burn a dissimilar coal, they become inefficient and run into operating difficulties and generally have a bad time.

Q What would you estimate the number of boilers designed to burn coal, say, from both your Will Scarlet and Allendale Mines?

A Well, I doubt that there was too much similarity where we could sell one or the other coal. There was not too many similar boilers where they could burn it efficiently. You can burn anything; you can burn match sticks if you want to, but it isn't efficient.

Of course, we never really got to that very much because our freight rate districts were different and our natural markets were in different areas.

[1454] Q Where would the coal from, say, the Allendale mine be sold?

A It was sold practically exclusively in the immediate area of Peoria and west and north until you ran into the Mississippi River where barge competition denied much sales.

Q What about the coal from your Will Scarlett mine in southern Illinois, where was that sold?

A It was sold—we had one major contract with TVA. It went to the Shawnee plant down below Paducah. The balance of that coal went into Wisconsin, practically all into Wisconsin or even further north.

Q Mr. Sherwood, do you have any experience in mining coal by the underground method?

A No.

Q What has your experience been involved in in this time you have been in the coal business?

A Well, it has been exclusively in the stripping end of the business.

Q Did Stonefort Mining Company have any experience in deep mining?

A No.

Q What was their experience confined to?

A Pardon me?

[1455] Q What was their experience related to?

A Strictly strip mining. As I said, my father started out as one of the first strip miners in 1913. The organization had been exclusively strip mining ever since.

Q In your opinion, Mr. Sherwood, could Stinefort have successfully entered into the mining of coal by the underground method?

A No.

Q Why do you say that?

A Well, except for the product, about everything else you can imagine as far as operating is entirely dissimilar. The stripping is a question of moving overburden. Underground operations are making a hole in the ground. There is just no relation.

Q Mr. Sherwood, prior to the time that I contacted you with regard to this lawsuit, did anyone else contact you with regard to this suit?

A Yes. About a year and a half ago, Mr. Sims and Mr. Futterman came down to Indianapolis and talked with me.

Q Did they indicate to you why they wanted to talk to you?

A Well, they indicated that they understood I [1456] was familiar with the midwest coal industry, and they wanted to talk to me in regard to this case.

Q Did such a discussion occur?

A Yes. They spent, oh, about two hours, I guess, with me in my home.

Q Did you ever hear from them again after that discussion?

A Well, no, not until last fall sometime after they heard that you were going to ask me possibly to be a witness in this case. Then they called me, and later on, I believe it was Mr. Sims who came down and talked with me for a short while.

Q They came down a second time at that point?

A Yes.

MR. KEMPF: Your Honor, we have no further questions. Perhaps the Government has a few more today, however.

THE COURT: Can you complete your cross examination in two minutes, Mr. Cusack?

MR. CUSACK: I doubt, your Honor, whether I would be able to, even moving with alacrity.

THE COURT: All right. We will recess until 2:00 o'clock.

(Whereupon, the hearing in the above-entitled cause was recessed to 2:00 o'clock p.m., the same day and date.)

[1458]

* * * *

AFTERNOON SESSION 2:10 P.M.

* * * *

SAMUEL F. SHERWOOD,

called as a witness by the defendants herein, having been previously duly sworn, resumed the stand and was examined and testified further as follows:

CROSS EXAMINATION

BY MR. CUSACK:

* * * *

[1464] Q Would the tendency be dropping off because of the disappearance of the smaller size producers?

A No. They are probably the people who need it the most. It is the fact that a sales agent—you really don't need one in dealing with your major customers such as utilities because you make a deal for a long-term, and there it is. You don't need to have a person on the payroll just working off his shoe leather, which you used to have selling to dealers and domestic coal and small businesses which mostly have gone to gas and other fuels in the past ten years and more.

Q Is it a fair statement to say that you don't need a sales agent so much any more because there is a shortage of coal and there is a relative ease in the sale of coal?

A You need a sales person, but usually the sales

agencies charge so much a ton. This is not really a good way to—it isn't fair to the producer to pay the kind of brokerage fee that these people as a rule try to get.

* * * *

[1471] Q That was Stonefort that finished a number of capital improvements, had finished making a number of capital improvements, and that the future for Stonefort was bright in 1966 at the time of its acquisition by Peabody?

A We had made the capital improvements, and the future was bright, with the exception of the exact time of acquisition. The major improvement, a 60-yard dragline at Will Scarlet, wasn't putting out the yardage that we had expected, and we were not producing the coal we expected.

Q But you were reluctant, were you not, to sell Stonefort to Peabody?

A I wish we had gotten a better price.

Q Isn't it a fact that you told the Government you were reluctant to sell Stonefort to Peabody?

A The timing of it was poor. We had been going into a project to put the company in shape where it would be a good property to merge, sell or dispose of in some way. We had some reserves in Gallatin County, which were chiefly underground reserves. We had a bear by the tail there, awfully good, but we didn't see how we could finance them or felt we had the capacity to operate.

* * * *

[1474] Q Would it be nearly a half million dollars?

A If my memory serves me right, it was about a million dollars.

Q About a million dollars? The approximate net worth of the Stonefort Company when it was sold to Peabody was about $8 million, is that correct, sir?

A Seven or eight, yes.

Q Isn't it a fact, Mr. Sherwood, that there were plans at the Stonefort Coal Mining Company for Stonefort to develop the deep coal reserves at Shawneetown?

A We discussed the possibility many times and came to the conclusion that we, as I said earlier, neither had

the capabilities nor the financial ability to develop a mine of the size necessary to compete in today's market.

* * * *

[1478] Q We are familiar with that.

Is it true, is it not, Mr. Sherwood, based on your knowledge and experience in the coal mining industry in the midwest, that there have been a number of instances where underground coal reserves were later stripped, is that correct?

A In a way, usually—sometimes the reserves that were underground were maybe not counted as very economical underground reserves and deeper stripping made them available, where otherwise they wouldn't be there at all.

If you have a thin seam, they might be underground, but not really be viable reserves under present economic conditions, and deeper stripping equipment make them available.

On the other hand, there has been a lot of good stripping that was ruined by old works years ago.

Q Is it fair to say that, generally, strip coal reserves, or what is thought to be economically mineable strip coal reserves, have increased over a period of time with the development of larger stripping shovels and equipment?

A The reserves have been added to by this equipment. Of course, the shallower stripping has been going [1479] away on the other side. Probably—I don't have any statistics, but you might be adding by going a little deeper from 50 to 60 to 70 or 80, but as this is going on, you are eating up the cream in the 40 and 50 and 60 stuff. So, you would have to study everybody's records to see how things stand as of now. You are adding one end and taking up the other. The addition, in my opinion, is coming pretty close to the end.

THE COURT: Can both sides hear the witness?

MR. HEDLUND: I am having difficulty, your Honor.

THE COURT: Would you speak up a little, please.

THE WITNESS: Oh, yes, sir.

THE COURT: Thank you.

BY MR. CUSACK:

Q You stated, Mr. Sherwood, did you not, that the quality of the Will Scarlett and the Allendale mine coals was substantially different, is that correct?

A That is right.

Q Would that be on a wash basis?

A Yes. Both—well, the Allendale coal had to be washed, no question about that. The Will Scarlett coal in certain markets, probably only to TVA, could have been sold raw. As a matter of fact, for a few months, when we started the mine, we did sell, I think, 70,000 [1480] tons of raw coal to TVA because our preparation plant was not in operation.

* * * *

[1485] Q 133 is Will Scarlett.

My question, sir, is this: Isn't it true, based on your recollection and based on these documents, that the BTU rating of the washed coal at Allendale was [1486] approximately the same as the BTU rating of the washed coal at Will Scarlett?

MR. KEMPF: May I have that question read?

BY THE WITNESS:

A No, these are entirely different. As I said in my testimony this morning, there is a 2,000 BTU difference. Allendale has as received washed at 10,444. Except for the carbon here, Will Scarlett had 2,000 more, 12,470 and another one at 12,524 and another one at 12,496.

I think I was correct in saying there is a 2,000 BTU difference in the coals.

BY MR. CUSACK:

Q Would your testimony be that on a wash basis there was also a 2,000 BTU difference?

A Well, those are on a wash basis. That is exactly what it says: "As received."

You have been confused with the dry basis which has no relation to how you sell your coal or what a customer wants for it. He doesn't care about the dry basis because he is getting water and moisture.

Q Is it your testimony or your belief, Mr. Sherwood, that the coal mined at the Will Scarlett mine and the coal mined at the Allendale mine, even though being 2,000 difference in BTU's, could not be used by [1487] the same utility generating station?

A It might be possible that they could use it, but from an economic point of view, they would be very reluctant to. As I said earlier, depending upon—when a utility builds a plant or a large customer, they get some idea where, what region, what types of coal they expect to draw their fuel supply from over the years. They relate traditional freight rates, cost of transportation, coal qualities and coal values in different areas to get delivered cost for a million BTU's, and they design their plant with as narrow a range as possible to fit where they expect the coal to come from.

Q Mr. Sherwood, the evidence in this case shows that the plants of the Commonwealth Edison Company can take a coal with a minimum sulphur of 2.5 percent and a maximum sulphur of 5 percent, a minimum ash of 5 percent and a maximum ash of 17 percent, a minimum percentage moisture of 7 percent and a maximum of 22 percent, a minimum BTU of 9,400 and a maximum of 13,000.

Isn't it true that both the coals produced at the Allendale mine and the Will Scarlett mine would come within those ranges?

A Well, I don't have a table right in front of me, but—

* * * *

[1490] BY MR. CUSACK:

Q No, sir, it runs—

THE COURT: Let the witness finish his answer, Mr. Cusack, then you can ask him another question.

BY THE WITNESS:

A They could be. Either Will Scarlett or Allendale coal basically fit these specifications, but I think in taking Commonwealth Edison, you are taking a company that has a number of power stations built at different years, and they have this for each station. Undoubtedly

their operating people would try to channel a certain grade of coal, a certain quality of coal, to a certain station where it would most economically burn the best.

Another point of view is that they are such a big buyer, burning something like 15 million to 18 million tons a year, I think, that they just have to buy from more than one producing area in one grade of coal, because they just gobble up everything in one area, and if they wanted to go to Fulton-Peoria and get all the coal out of there, no one else would have any.

Q Commonwealth Edison does buy coal, does it not, from almost every producing district in the midwest?

A Yes.

• • • •

[1492]Q Mr. Sherwood, do you believe an Illinois coal mining producer with average net profits after taxes of over $3 million a year was in a better or in a worse position than Stonefort in going into underground mining?

A I don't know. That is a hard question to answer. I don't think you really have given enough basic facts.

Q Just on the basis of profitability of the two companies.

A You are saying one company has a net profit of $3 million?

Q Per year, sir.

A Per year? As against Stonefort?

Q Yes.

A I don't know that the profitability makes too much difference. The question is do you have the know-how to do it and on what scale are you going to have to learn.

Q Mr. Sherwood, does Stonefort ever attempt to acquire any strip coal reserves from any other coal producer?

A Well, we did in the Allendale situation. We took over a whole reserve area, which was rather limited, but something that we thought we could do with our used equipment.

[1493] Q You purchased this entire mine field, did you not, from Pittsburgh & Midway?

A We simply leased it. We assumed control of it,

what they had, and added to it as we saw fit and were able to.

Q And Allendale was a profitable operation, was it not?

A Yes. It had a rather limited life, and that was the reason that P & M turned it over to us. They claimed the reserves were seventeen million. We figured it a little more conservatively and came up with twelve million, which wouldn't support new equipment.

The reason we got together was that our Little John Mine was fading out. They heard of this. I think a year and a half to two years before Little John closed, they got in touch with us and said, "We have reserves that we don't think we can operate a mine on, put a mine on. You have a mine that is going out and some equipment nearby." They are only about 30 miles away.

Also their problem was that they had made—their leases were 20 year leases basically, and ten years had run on them. So there is only ten years to go.

We took that risk of renegotiating these leases, and, of course, in part of the ten years we would have mined them out.

[1494] But if we had to start in with a whole new plant, new shovel, new trucks, new tractor, new loading shovel, new preparation plant, we wouldn't have done it, and they wouldn't either. We brought in all our pit equipment. The only thing new we put in was the preparation plant.

Q Is it true Stonefort examined the property where the Banner mine was located in the early 1950's?

A We examined, as I recall, a portion of it that was controlled then by a fellow by the name of Cook. I had some discussions with him on it. We didn't examine it too much. I recall that back in the 30's, the late 30's, I guess, looking in the records and talking with my father, that it was worked on at that time and nothing came of it.

Q Is it fair to state, sir, that Stonefort had an opportunity to acquire the Banner property?

A I don't think we got far enough down the road with Mr. Cook to say we had a real opportunity. I believe he was running non-union. There were some prob-

lems with that property. They were rather limited reserves, very thin coal and along the Illinois River you are working behind a levee, a low drainage level. There is the risk of having a major seepage or, if something happened to that levee, bringing the whole Illinois River into your [1495] pit. That is a pretty troublesome risk.

* * * *

REDIRECT EXAMINATION

BY MR. KEMPF:

* * * *

[1503] Q You discussed the moving of the equipment from the Little John to the Allendale Mines during the course of your cross examination. When did this move occur?

A That was in the 1959-60—I can't remember. It was right in there.

Q Approximately a decade ago?

A Yes.

Q My question is would you expect that the figures you estimated concerning the cost of moving that equipment, if indeed the equipment were the same—I think you referred to a 35-yard shovel.

A Yes.

Q Assuming the moving of the same equipment, only of the same equipment, at the present time, would you expect that cost to be lower, higher or about the same?

A It would be much higher obviously, and not only that, but Allendale's was designed for a five or six hundred thousand ton a year operation, and really that is hardly a viable size mine. As things go, you would really have to start with a bigger machine, which would cost a lot more.

Q Was any part of that equipment moved by rail?

A A few of the major pieces. I think the dipper stick and bucket and a few pieces that were too big and [1504] awkward to move—we could have cut them up, but it would have been even worse. So we put them on flat cars, and we moved them. They were too big for the highway basically.

[1507] NORMAN W. MOSER,

called as a witness by the defendants herein, having been first duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. KEMPF:

Q Please state your full name, sir, and spell your last name.

A Norman W. Moser; M-o-s-e-r.

Q What is your home address, Mr. Moser?

A 440 North 22nd Street, LaCrosse, Wisconsin.

Q By whom are you employed, sir?

A I am employed by the Dairyland Power Cooperative with offices at LaCrosse, Wisconsin.

[1508] Q What position do you hold with Dairyland Power Cooperative, Mr. Moser?

A I am chief engineer.

Q Do you have anything to do with Dairyland Power Cooperative's power production activities?

A I am in charge of power production for Dairyland.

Q How long have you been with Dairyland Power Cooperative?

A I started with Dairyland Power Cooperative as a turbine operator in Genoa Plant 1 in 1941. I was transferred to the general office in 1945 and became chief engineer in 1951. However, I have been in charge of power production since 1945.

Q In your capacities both in charge of power production and as the company's chief engineer, have you taken an active participation in the company's plant construction and fuel procurement activities?

A Yes, I have.

Q Would you briefly describe for us the general area served by Dairyland Power Cooperative?

A We serve the rural areas in western Wisconsin, the northwestern tip of Illinois, the southeastern portion of Minnesota and the northeastern portion of Iowa.

[1509] Q Mr. Moser, I am going to hand you what has been received in evidence as Defendants' Exhibit

145. This is a map entitled "Service Area, Dairyland Power Cooperative, LaCrosse, Wisconsin," as of June 1, 1968.

If you would look at that, please, tell me does that accurately portray the specific service area served by Dairyland Power Cooperative?

A Yes, it does.

Q What electrical generating facilities does Dairyland Power Cooperative have, Mr. Moser?

A Well, we have three generating stations on the Mississippi River, one at Cassville, Wisconsin, that has a capacity of about 52,000 kilowatts. We have a station at Alma, Wisconsin, that has a capacity of 205,000 kilowatts. At Genoa, Wisconsin, we have our original steam generating station of 14,000 kilowatts, and our two newest generating stations, a nuclear generating station of 60,000 kilowatts, and a new coal-burning station that went into operation last year of 350,000 kilowatts.

In addition, we have diesel stations, one diesel station at Twin Lakes, Minnesota, of 10,000 kilowatts, and one at Chippewa Falls, Wisconsin, of 3,200 kilowatts, and a hydro station on the Flambeau [1510] River near Ladysmith, Wisconsin, of 20,000 kilowatts.

Q From whom does Dairyland Power Cooperative secure the coal which is burned at its coal-fired generating stations?

A Well, since our plants are on the Mississippi River, we secure the coal from the Belleville area of Illinois as a general rule. There are exceptions of receiving coal in small amounts from other areas along the river.

[1511] Q You indicated that you at some time last year brought in your newest coal-fired station at Genoa. When did you bring that into operation last year?

A That station went into operation in July of 1969.

Q Did this materially increase your coal requirements?

A By a substantial amount.

Q What did that lead to in terms of acquiring additional coal?

A In acquiring additional coal last year, that coupled with some of the problems in the Belleville area, required us to get into the West Kentucky fields a little more than we had in the past. There were several factors.

First, the river was in flood stage, putting locks out of operation for about one month last year that thoroughly fouled up our shipping schedule. We must receive all of our coal on the river during the time it is open, about seven months of the year. One of these months was lost due to flooding.

With our additional requirements immediately behind the flooding of the upper river, the mines in the Belleville area were subject to problems that were weather-induced, flooding in this area, in the Belleville [1512] area. So, this resulted in us looking in particularly the West Kentucky fields for additional coal.

Q How was that coal shipped to you?

A It was shipped by barge. We have no facilities for handling rail coal in large quantities.

Q Are you encountering the same weather difficulties this year? I realize the season is not substantially under way, but thus far this year, have you encountered these difficulties?

A No. The navigation season looks like it is opening in a much better note than it did a year ago, because at this time last year, we were approaching the flood stage. At the present time, there is no indicated flood on the upper Mississippi River.

Q As a result, have you increased, again, your shipments of coal from the Belleville district?

A Yes. The coal is coming fairly well on schedule this year.

Q I would now like to show you what has been received in evidence as Government Exhibit 90, a table referred to as "Common Known Customers of The United Electric Coal Companies and Freeman Coal Mining Corporation," showing destination points. This particular exhibit is for the year 1967.

[1513] There are similar exhibits designated as Government Exhibits 88 and 90 which cover much the same information but which are for the years 1965 and 1966.

THE COURT: You said 88 and 90. Do you mean 89?

MR. KEMPF: Yes, 88 and 89. I am sorry.

THE COURT: All right.

MR. KEMPF: This is 90.

THE COURT: Yes.

MR. KEMPF: If I may approach the witness, your Honor—

THE COURT: You may.

BY MR. KEMPF:

Q I would now hand you this exhibit and refer you to page 2 thereof.

The first entry on page 2 thereof refers to Dairyland Power Cooperative. It indicates that Dairyland Power Cooperative has received shipments at, I believe, both its Alma and Cassville Stations from Freeman and United Electric.

My question is, do you consider Freeman and United Electric to be competitive for the business of those stations.

A I do not consider them directly competitive. The product we get from Freeman is dust. This is shipped [1514] as a by-product to us.

We do have limits in how much we can receive of this material.

Q What do you receive from United Electric?

A We receive the wash screenings from the Fidelity Mine.

[1515] Q What type of purchasing system does Dairyland Power follow in securing its coal, Mr. Moser?

A Most of our coal is on long-term contracts.

Q Of how long a duration are these?

A These are from 10 to 20 years.

Q Why do you secure your coal under these type of arrangements?

A Well, because of our substantial investment in power plants, why, we must have some assurance of our supply.

Q What restrictions, if any, are there with respect to the coal which can be burned in the boilers operated by Dairyland Power Cooperative?

A Well, while we request design flexibility as much as possible, the modern boilers do have to be designed around the specification of coal. This deviation from this coal begins to cause operating problems such as loss of efficiency or even inability to keep the unit either at its rated load or on the line at all.

Q What about your newest station that you described that came into operation last summer at Genoa? Does that have a narrower, a wider or about the same range of specification regarding coal characteristics as your older plants have?

[1516] A As these units get larger and more sophisticated, their ability to handle a range of coal becomes narrower.

Q Have you had any actual experiences where the use of a type of coal which did not meet the specifications of your boilers led to difficulties such as you have described?

A In this new unit, as I mentioned, we had to go to some west Kentucky fields that we were not so sure of the quality of the coal. As a result, we loaded this new unit with slag to the extent that it was off the line, and we had to get in and remove the slag. The first attempt at this was done with jack hammers. However, this was not too effective. So, finally, we used the jack hammers to drill holes and used dynamite to blast the slag out. We estimated between 40 and 50 tons of slag accumulated in this boiler.

Q I am sorry, I didn't pick up the tonnage amount.

THE COURT: Read the answer.

MR. KEMPF: Just the latter portion.

THE COURT: Just the last part.

(Record read by the reporter.)

BY MR. KEMPF:

Q 40 and 50 tons of slag?

A Yes.

[1517] Q You mentioned that of your two newest facilities, one is the coal-powered station at Genoa, to which we have just been referring, and the other you indicated also at Genoa is your nuclear-powered station.

Has Dairyland Power Cooperative made any decision as to what fuel will be used at the next station you add to your system?

A No, we haven't decided what fuel will be used in the next station. We are continually comparing nuclear coal. Unfortunately, we have to look at the air

pollution problems caused by coal. We are looking at gas and oil as possible alternate fuels.

Q Are any of the coal-fired stations which Dairyland Power operates, Mr. Moser, near metropolitan areas?

A No, they are not. You wouldn't think that we would have the problem of air pollution, but we have been sued at our Alma station by three farmers in the area. This suit has led to a landmark decision by the Wisconsin Supreme Court, indicating that we are a nuisance and that the farmers in the area have the right to sue us for damages.

Q This is damage caused by what?

[1518] A This damage, the suit was based on damage caused by sulphur oxide emisions.

[1519] Q And what was the damage done to? The farmers individually?

A The damage was done primarily to the alfalfa crops, some of the trees on the farm, and some damage to the farm buildings themselves.

Q When did this decision come down?

A This decision came down in December of 1969.

Q Do you and other executives of Dairyland Power take an active interest in the subject of the regulation of air pollution?

A Yes, very much so. Our general manager, John Madgett, was on the President's Environmental Committee, and at the present time the State of Wisconsin is in the process of establishing air pollution rules. I have attended a number of those hearings.

In addition to that you might say I am quite a regular visitor to the City Council of Alma, Wisconsin, and, well, just last week I had to face some of the teach-in people that are getting ready for the environmental teach-in next week.

Q Will the subject of air pollution have any effect on the fuel purchasing decisions of Dairyland Power Cooperative?

A It necessarily will have to, because the [1520] regulations are coming. We in Wisconsin do not know exactly what they will be. We have a general idea that the proposed rules are very strict on particulate emission.

As yet they have not established a criteria for gaseous emissions.

Q Are the people in the rural areas you serve concerned with air pollution?

A They definitely are. They feel that they have clean air now and they intend to keep it that way.

Q As a result of the impact of the air pollution regulations do you think this may affect your fuel purchasing in the future?

A Yes. We have to look at ways of abating the pollution in existing plants and in future plants. It will have a definite bearing on the design of the fuel that we burn. The regulations are dictating to us to a certain extent the type of fuel that we will be able to burn.

[1521] Q Mr. Moser, what effect, if any, does the combined ownership of United Electric and Freeman by General Dynamics have on the competition for Dairyland Power Cooperatives' fuel business?

A We do not feel that it has any detrimental effects, primarily because we use different types of coal from each of the companies. In our long-term contracts, we are not sure and United Electric is not sure of their reserves, and we feel that in the competitive field of coal, strong companies are better than a great number of companies.

MR. KEMPF: No further questions at this time.

THE COURT: You may cross examine.

CROSS EXAMINATION

BY MR. FUTTERMAN:

Q Mr. Moser, you stated on your direct examination that your company will be forced to consider other types of fuels in its future decisions. At the present time is Dairyland Power purchasing any interruptible gas?

A Yes.

Q And you confine those purchases to the summer months, do you not?

A Yes. These gas purchases are for the small [1522] diesel station that is less than 1 percent of our total generation.

Q You could not afford to buy gas at the firm rate, could you?

A In view of the air pollution, we do not know all of the answers yet. We may have to buy gas at firm rate.

Q Didn't you tell me the other day when I spoke to you on the phone that the Wisconsin Public Utility Commission told your company it should not ask the gas company to increase the supply of natural gas being supplied your company because of the shortage of natural gas in Wisconsin?

A We received a letter from the Public Service Commission saying in effect that until further gas was allocated to Wisconsin, the new pipeline would likely not be built.

Q So as of the present time you would not be able to increase the supply of interruptible gas or contract to purchase firm rate gas to fuel any future generating stations, is that correct?

A The only place we have a gas line now is in the diesel station.

Q Is that a peaking station, sir?

A It is used for peaking largely.

• • • •

[1524] Q You testified you also would consider oil. Are you presently burning oil at stations other than your diesel station?

A Only light-off oil. We are not burning any of the heavy oils.

Q Light-off oil is not used for purposes of generating electricity, is that correct?

A No, it is not.

Q At the present time oil is not priced competitive with coal for the purpose of generating electricity within your system, is it?

A On similar equipment we still have to consider all of the factors of meeting air pollution control regulations, particularly in existing units that are very expensive to put additional equipment on, and in the case of sulphur emissions, why we are not to the point that there is equipment that can be installed that will work satisfactorily to our knowledge.

Q You are experimenting at the present time. Are you negotiating with Foster-Wheeler Company at the present time to install some equipment which may be designed for the purpose of controlling SO_2 emissions?

A We are negotiating to enter into a research project with the Foster-Wheeler Company on the process [1525] that is as of yet untried, and Foster-Wheeler has asked to work on one of our units, and we are very happy to work with them in the hope that we will achieve a breakthrough in the recovery of the sulphur oxide gases.

• • • •

[1529] Q (By Mr. Futterman) When you talk about the air pollution problems your company has had, isn't it true that until the very recent past, your generating facilities did not have electrostatic precipitators on them?

A The only electrostatic precipitator we have at the present time is the new unit at the Genoa Station, the 350,000 megawatt unit.

Q Isn't it true that most of the large utilities have had electrostatic precipitators on their units for some time?

A They have on their larger units. The smaller size, such as we have at Alma, for instance—it has not been the common practice in an area such as the Alma plant is located into have electrostatic precipitators. They are equipped with mechanical precipitators. They will not meet the proposed air pollution control regulations of the State of Wisconsin with mechanical precipitators.

[1530] Q Would they meet these regulations with electrostatic precipitators?

A They would, provided we know the sulphur content of the coal, because an electrostatic precipitator has to be designed to a certain extent around the sulphur content of the coal. If we would go to a low sulphur coal at the new station at Genoa, the electrostatic precipitator would lose enough of its efficiency to cause a particulate problem.

Q That is because with low sulphur coal you have a greater proportion of particulate matter than you do with the higher sulphur coal?

A No. It is a matter of ionization of the flue gas.

Without the sulphur dioxide present, the ionization does not occur as readily as it does with the sulphur dioxide present, so the two problems are interrelated.

Q Mr. Moser, when you are receiving a barge load of coal, how do you determine which of your stations that barge load should be assigned to?

A To some extent we delegate this to the people that handle our shipments. Generally speaking, we do not designate, except in some cases, the coal that we would like to go to one station.

• • • •

[1534] Q What percentage of the coal that your company is currently receiving would you estimate is purchased on the spot market?

A My estimation now would be about 40 percent.

Q And that coal comes from the Belleville district, the southern freight rate district, and west Kentucky, does it not?

A Primarily west Kentucky.

Q In the past you have purchased some coal from Fulton County, have you not?

A Very small amount.

Q In the event that you would have trouble satisfying your coal requirements from Belleville freight district, from the southern freight district and from west Kentucky, would you consider the possibility of purchasing coal from the Fulton-Peoria freight rate district?

A Purchasing coal in the Fulton County area has been a rather difficult thing for us to accomplish. It is a long river haul. We do not have the rail handling facilities. As I say, in the past we have purchased some of this coal, and it has given us some operating problems.

• • • •

[1540] Q Once having decided the point from which or the coal field from which the coal for this new station would originate, would you then design the boiler to accommodate that kind of coal or coals if more than one field is involved?

A We would try to get as much range as we could in there, but we would have to specify the coal that we

expected to get for this new unit and then request as big a range as we could talk the boiler manufacturers into bidding on.

As I mentioned earlier, the larger and more sophisticated units are getting narrower in their range of coal burning.

Q Mr. Moser, isn't it a fact that Freeman and United Electric are currently supplying coal which is consumed in both your Alma and Genoa generating stations?

A Yes.

Q Isn't it true, also, that Freeman has the option of furnishing this coal from any of its southern Illinois mines?

A The contract with Freeman is for the dust. I believe it lists three mines, as I recall, three or four. I am not sure which, but the contract does call for a minus-10 pulverizer mix or a dust product.

[1541] Q At the present time, do both United Electric and Freeman salesmen call on your company?

A Yes.

Q Isn't it a fact, Mr. Moser, that the price of the dust is determined by its BTU content?

A No. These contracts, of course, were entered into some time ago. At that time—and an escalation has changed these, the relationship. But at the time we entered into the contract for the dust, it was our lowest BTU cost, and no other supplier would attempt to meet it.

Q That is not true today, though, is that correct?

A I am not sure if that is true today because of the escalations that have gone into effect, because the escalations for labor in deep mines have been more. There has also been some freight increases.

Q Isn't it true that at the present time, you are receiving coal from the United Electric Fidelity mine with a BTU value of 11,400 and a cheaper delivered cost than the dust with the same BTU value that originates in the Freeman mines?

A That is possible that that has crossed. I haven't checked that yet this year or last, but it is [1542] possible that that has crossed with the frieght increase. They are both on long-term contracts with escalation. The es-

calation on deep mines has been more for labor. Since the southern Illinois freight rate is greater, the freight rate increase has been more than some of the Belleville increases.

[1543] Q Isn't it true that you are receiving coal screenings from southern Illinois at a delivery cost which is cheaper per BTU basis, per million BTU basis, than the dust received from the Freeman Mines in the southern freight rate district?

A That might have been for the dog-hole coal that we received later. I don't believe we are receiving any coal at the present time on that basis from southern Illinois.

Q Mr. Moser, isn't it true that the screenings and the dust are consumed in the same facilities?

A Yes. They are mixed before they go into our facilities.

Q When the screenings are pulverized, they go into the boiler in the same form as the dust, do they not?

A Yes. They are pulverized together.

Q For every ton of dust that you consume, that means that you do not consume a ton of screenings, is that correct?

A Yes. Up to the limit that we can receive and handle and mix the dust, which I have prescribed an arbitrary limit of approximately 10 percent, yes.

Q The dust which your company consumes, that is delivered to you on barges, is it not?

[1544] A Yes.

Q All the screenings which you purchase are delivered on barges, are they not?

A Yes.

Q The dust and the screenings are used for the same purposes, to generate electricity, is that right?

A Yes.

Q Mr. Moser, in regard to your testimony concerning the possibility of using Western coal for the purpose of generating electricity, didn't you tell me that you thought there might be a shortage of railroad cars which could be utilized to move coal to the Midwest markets from the West?

A That is a problem that I think we might have at the present time in transporting this coal. I have not explored that to the extent of being told solidly this. My only contact with the railroad people were before the merger of the Great Northern and the Burlington was in effect. They said, "We will talk about that after the merger." I haven't made the move and neither have they to further discuss it.

• • • •

[1549]

IN THE UNITED STATES DISTRICT COURT
NORTHERN DISTRICT OF ILLINOIS
EASTERN DIVISION

No. 67 C 1632

UNITED STATES OF AMERICA, PLAINTIFF

vs.

GENERAL DYNAMICS CORPORATION; THE UNITED ELECTRIC COAL COMPANIES; AND FREEMAN COAL MINING CORPORATION, DEFENDANTS

Before HON. EDWIN A. ROBSON, Judge,
Tuesday, April 14, 1970,
10:30 o'clock a.m.

PRESENT:

MR. JOHN THOMAS CUSACK,
MR. ROBERT L. EISEN,
MR. RONALD L. FUTTERMAN,
MR. HUGO SIMS, and
MR. RICHARD J. BRAUN,
appeared for Plaintiff;

MR. HAMMOND E. CHAFFETZ,
MR. REUBEN L. HEDLUND,
MR. DONALD G. KEMPF, JR., and
MR. RICHARD H. IRVING, III,
appeared for Defendants.

ALSO PRESENT:

DR. PETER STEINER.

• • • •

[1554] NORMAN W. MOSER,

called as a witness by the defendants herein, having been previously duly sworn, resumed the stand and testified further as follows:

CROSS EXAMINATION (continued)

BY MR. FUTTERMAN:

• • • •

[1564] Q Mr. Moser, on your direct examination, you stated that you were not sure and United Electric is not sure of their reserves. What did you mean by that?

A The last time we requested United Electric to extend the period of our long-term contract, they put in a provision on the last two years of the contract, "Subject to availability of the coal."

Q Did you examine United Electric's reserves books at that time?

A No, we did not examine their books.

Q Has United Electric ever offered to supply you with coal from the McDonaugh-Schuyler County area in Illinois?

A No, they have not.

Q If I were to suggest to you that the coal in the McDonaugh-Schuyler County area is a better quality coal than the Fulton-Peoria coal, would you be interested in purchasing it?

MR. KEMPF: I am going to object unless the witness knows where the McDonaugh-Schuyler area is. I do not think Mr. Futterman has laid a proper foundation.

BY MR. FUTTERMAN:

Q Do you know where that area is?

A No, I am not aware.

[1565] Q Mr. Moser, I direct your attention to what has been received in evidence as Government Exhibit Nugent Deposition Exhibit 38, and I point on the map to the McDonaugh-Schuyler County area. If you would like to come over and take a look at it, you can.

Do you have my question, sir?

THE COURT: Read the question.

(Question read by the reporter.)

BY THE WITNESS:

A It is possible. However, from looking at the map, it appears that there would be a transportation problem, that this would have to go down probably the Illinois River and back up the Mississippi River.

I know of no loading docks in that area on the Mississippi River or the ability to get it over there.

BY MR. FUTTERMAN:

Q Do you think it would cost more money to transport coal from that area in the manner you have just described than it is currently costing you to transport coal from west Kentucky to your generating stations?

A I would expect so.

Q You testified on your direct examination that you rely on the Belleville district for substantial tonnages of coal, is that correct?

A Yes.

[1566] Q I should like you to assume that one of your suppliers in the Belleville district has undeveloped reserves in that freight rate district, and assume further that the supplier is controlled by a large company which is not permitting the supplier to develop these Belleville reserves to their fullest potential. Would that be adverse to your company?

MR. KEMPF: I object, your Honor. Again this is similar to the questions I have objected to before. I think again the assumption is based upon facts which are not in evidence. I have no objection if he wishes to reframe it in terms of a hypothetical question, but in the terms of the question, that is, based upon assumptions on the record, I do not think there is any evidence to that effect.

THE COURT: Is there anything in the record to that effect?

MR. FUTTERMAN: Your Honor, I believe I did phrase it in the form of a hypothetical question. I think the record clearly shows that United Electric has reserves in the Belleville freight rate district and these reserves are not being developed at the present time.

I think there has been testimony in the record that these reserves may be developed at a future date.

[1567] MR. KEMPF: There is evidence of that, but Mr. Futterman's characterization of the reasons for that are part of his question.

THE COURT: Read the question.

Q (Read by the Reporter.)

THE COURT: He may answer.

BY THE WITNESS:

A Based on an assumption that reserves are not being developed, it would be adverse to our company.

BY MR. FUTTERMAN:

Q Mr. Moser, do you know that there is a coal unloading dock at Warsaw on the Mississippi River just west of the McDonough-Schuyler County area, and that this dock is served by the Toledo, Peoria & Western Railroad?

A We have never used this dock. I am not fully aware of its capability.

Q You have testified that you have had active participation in plant construction and fuel procurement and because of the substantial investment in power plants you need the assurance of a supply which is provided by long-term contract.

Have you participated in the negotiations of coal contracts?

[1568] A Yes, I have.

* * * *

Q Isn't it true that pursuant to the contract with United Electric, Dairyland Power Cooperative may have coal consigned to its Alma, Cassville and/or Genoa [1569] stations?

A Yes.

Q Mr. Moser, isn't it true that the price which you pay for coal may be renegotiated each January under the terms of that contract?

A I believe there is that provision in that contract. We usually have a provision for some renegotiation. However, we also have the escalation provisions in all of these contracts, which are tied to supplies and to labor cost.

[1570] Q Is it not true that if the parties fail to reach agreement with regard to this price negotiation, the contract is then cancelled for the succeeding 12 months and is again subject to price renegotiation the following January?

A That could be a provision. I haven't read that contract that recently.

Q Would that be a typical kind of a provision in a long-term contract?

A We have had provisions that the price was subject to negotiation or subject to negotiation if price did not meet substantial competition. Now, I am not sure if that is in the present United Electric contract or not, that provision.

Q Mr. Moser, at the present time are Freeman and United Electric supplying the Genoa station?

A Yes.

Q Did you ever have any conversations with any officers of the defendants, that is either Freeman or United Electric, in regard to this case?

A With the officers? I believe not.

Q Did you have any conversations with any representatives of the defendants in this case?

A We have had some conversations with the counsel.

* * * *

[1573] REDIRECT EXAMINATION

BY MR. KEMPF:

Q Mr. Moser, during the course of your cross examination by Mr. Futterman, he asked you a number of questions about your developmental nuclear station at the Genoa location. Do you consider that the company's participation in that developmental project has been a benefit to the company?

A Yes, it has, because we have developed nuclear capability in operation so that we are in a position to consider seriously a nuclear station in our next expansion.

Q Have you made any preliminary cost projections comparing the cost of fossil as opposed to nuclear for your next station?

A We participated in a study with the other power cooperatives in the area. I believe that study was completed about a year ago for a nuclear station to be constructed by, I believe it was, five power cooperatives in the area.

Q Did the study indicate that it would be more attractive from an economic standpoint to build a nuclear or fossil plant?

A From an economic standpoint it looked like the 500 megawatt nuclear station was, from an [1574] economic standpoint based on that study.

Q During your cross examination yesterday you referred to both Western coal and Western lignite. I take it these are two distinct and different things to which you have looked?

A Yes, the lignite that we tried was a North Dakota lignite that was a small quantity tried in the unit.

The Western coal we considered was a subtuminous from either Wyoming or Montana.

Q This morning you indicated that for a comparably-sized fossil unit the cost of your hydro station in terms of capital cost exceeded the cost of a comparably-sized fossil unit, coal unit.

My question is, if you compared the operating costs of the two, which would be the higher?

A The operating costs of a fossil-fired unit are much higher than the hydro costs.

Q If you then took and combined both the operating and the capital cost, what would be the comparison between your hydro station and your fossil station, specifically your older fossil stations which are comparable size?

A Our hydro station has the lowest over-all cost.

* * * *

[1575] Q You indicated that you had spoken with Mr. Futterman last week. Had you spoken to him on prior occasions also in connection with this case?

[1576] A Yes, I believe a week or two earlier I also had a telephone conversation with Mr. Futterman.

Q Would you describe that as a lengthy or short conversation?

A I would say it was the greater part of an hour.

Q Mr. Futterman posed a question to you based on a number of assumptions. He asked you to assume that a company had some undeveloped deep reserves and that the parent company had not developed them. I have a somewhat different but somewhat similar question to pose to you.

My question is, I want you to assume that a supplier with whom you have been dealing is a strip mine operator and has no experience or expertise in operating a deep mine. If that supplier came to you and indicated that notwithstanding its lack of experience and expertise in deep mining it would like to open some deep coal reserves and sell them to you on a long-term contract, what would your reaction as a coal purchaser be?

A My first reaction would be to want to see his deep mining capability. If he had only mined strip in the past, I would have serious doubts about his capability of mining deep coal.

* * * *

[1580] GORDON R. COREY,

called as a witness on behalf of the defendants, having been first duly sworn, was examined and testified as follows:

THE COURT: Mr. Corey was one of my experts in the electrical equipment cases.

THE WITNESS: Thank you.

THE COURT: It is nice seeing you. You may proceed. I don't know how good he is on coal. You may proceed.

MR. HEDLUND: We will endeavor to find out, your Honor.

DIRECT EXAMINATION

BY MR. HEDLUND:

Q Would you please state your name and present occupation?

A Gordon R. Corey, Chairman of the Finance Committee of Commonwealth Edison Company.

Q Mr. Corey, how long have you held the position of Chairman of the Finance Committee?

[1581] A Four or five years, I guess. I have been in charge of that at the Edison Company for about, nearly ten years.

Q Have you been a director for the same period of Commonwealth Edison?

A Yes.

Q What, briefly, are your duties and responsibilities as chairman of the finance committee?

A In general charge of the corporate financial, purchasing, legal and rate making activities of the company as well as treasury and accounting.

Q Would contract activities also come within your responsibilities?

A Yes.

Q Among the purchasing activities for which you are responsible, is the purchasing of fuel included therein?

A Yes.

Q Are you a director of any other company?

A Yes, I am a director of the Continental Illinois Bank and its holding company, Conill Corporation, and I have been proposed as a director for Inland Steel Company.

[1582] Q Would you please give me a brief summary of your educational background?

A I have a Bachelor's degree from the University of Wisconsin, an M.B.A. degree from Northwestern University. I am a Certified Public Accountant in Illinois.

Q Could you tell me how long you have been with Commonwealth Edison Company?

A Since 1939 with Commonwealth Edison or Commonwealth Edison subsidiaries.

Q Is Commonwealth Edison an investor-owned public utility?

A Yes.

Q Do you know how it ranks in size among investor-owned public utilities in the United States?

A Well, it is second or third, depending on how you measure it. In terms of kilowatt hour sales, I believe it is No. 3.

Q Tell me approximately how large the revenues of Commonwealth Edison were in 1969?

A Something like $750 million.

Q What about the assets of the company, just generally again?

A Net $2.5 billion.

[1583] That is net $2.5 billion?

A Yes.

MR. CUSACK: The Government objects, your Honor. All this information is in Commonwealth Edison's annual report for 1969, which is in evidence as Defendants' Exhibit 90.

MR. HEDLUND: I am not going to go into detail on this.

THE COURT: All right. Let's not be repetitious.

BY MR. HEDLUND:

Q Could you describe generally the service area of Commonwealth Edison?

A Yes. It is roughly the northern one-third of Illinois, about 13,000 square miles, including the City of Chicago and all of the Chicago metropolitan area which is Illinois.

Q Mr. Corey, I direct your attention to what has been received in evidence as Defendants' Exhibit 144, which is a map of Investor-Owned Electric Utility Services Areas. I wonder if you could describe by color and number the service area of Commonwealth Edison as shown on that map?

A I don't know whether that is mauve or purple, but it is No. 30.

Q Can you tell me, please, sir, what approximately [1584] Edison's net generating capacity was at the beginning of this year?

A Approximately 10 million kilowatts.

[1585] Q Could you tell me generally what the mix of fuel is as used by Commonwealth Edison in its generating plants?

A Yes. It is about 18.5 million tons a year of coal, 3 million tons of gas, 1 million tons of uranium, and an insignificant amount of oil, but we are changing this mix, and for the year 1971 we expect to burn approximately 16 million tons of coal, 5 million tons of gas, and with our nuclear units coming on, with additional nuclear units coming on, and Dresden 2 produced first power late last night, 5.5 million equivalent tons of uranium, and 1.4 million equivalent tons of oil.

When I use tonnage figures for oil and gas and

uranium, I am simply stating the BTU's in terms of equivalent tons of coal. It is for a total of about next year something on the order of 28 million tons of coal and other coal equivalents.

Q Prior to last evening, where was the nuclear fuel burned that you referred to with respect to 1969?

A Well, I was not referring to 1969. I was referring roughly to a normal annual burn of fuel. In 1969 we burned a little less uranium than I mentioned because the unit which you are asking me about was not [1586] in service all year. We burned only 700,000 equivalent tons of nuclear fuel, and that was burned at Dresden Unit 1, at Dresden station, where the Kankakee and Des Plaines Rivers come together to form the Illinois River.

Q How long has Dresden 1 been in operation?

A Since 1960.

Q What other nuclear plants do you have presently in operation or under construction?

A Well, the one that came on, that produced first power late last night, was Dresden Unit 2, an 809,000 kilowatt unit, located at Dresden station.

We have a third unit scheduled to come in service at Dresden station, Dresden Unit 3, another 809,000 kilowatt nuclear unit scheduled for service toward the turn of the year, either late December or early January, next year, scheduled to produce first power.

We have then two units scheduled for service at our Quad-City station, which is located on the Mississippi River north of the Quad Cities of Davenport, Moline, Rock Island and East Moline, and each of these two units will be 809,000 kilowatt units, one scheduled for service early next year and the other scheduled for [1587] service late next year or early the following year.

Then we have two units under construction at our Zion station, which is located near the municipality of Zion, on Lake Michigan, near the Wisconsin-Illinois line.

These are each 1100 megawatts, that is, 1,100,000 kilowatts, nuclear units, one schedule for service in the

Spring of 1972 and the second scheduled for service in the Spring of 1973.

[1588] Finally, we have two nuclear units just announced. They have not been ordered. We have received bids and are currently evaluating bids. These are for approximately 1,100,000 kilowatts for each unit. We have not designated the location, but we expect it to be on the Illinois River some place in central Illinois.

These are scheduled for service in 1976 and 1977.

This brings our total nuclear capacity, after deducting a portion that is owned by Iowa-Illinois Gas & Electric Company, a portion of the Quad-City stations—it brings the total capacity to approximately 7,400,000 kilowatts.

Q And that would include the two new units that you have just announced?

A Yes.

Q Could you tell me roughly what the coal equivalent would be of the nuclear fuel to be burned in the stations which will total 7,400,000 kilowatts?

A Well, we think it is on the order of 20 million tons per year.

Q Do you know how Commonwealth Edison compares with other utilities in the country in terms of nuclear units in operation or under construction?

[1589] A Yes. We have the largest nuclear program announced, to my knowledge. We are just about neck and neck with TVA. TVA had some 5½ million kilowatts announced prior to our announcement of a week or two ago, and we at that time had about 5,400,000, including 200,000 portion to be owned by Iowa-Illinois Gas & Electric Company. I believe our recent announcement makes us larger than TVA, but I know they are considering two or three additional nuclear units. So we are about neck and neck with TVA, and we represent, oh, about some place between 8 and 10 percent of all the nuclear capacity on order, under construction, or in service in the United States.

So the two of us together would have about one-fifth of the capacity, or a little less than that.

THE COURT: Can you hear the witness at the table? There is no indication that you cannot. Proceed.

BY MR. HEDLUND:

Q Mr. Corey, I believe you gave us an indication of your fuel mix for the year 1971. Could you give me a similar indication for the year 1974?

A Yes. About 15 million tons of coal, 4½ million tons of gas, 14 million equivalent tons of uranium, and 1½ equivalent tons of oil, making a total [1590] of 35 million tons of coal or equivalent tons of other fuels.

This, however, is subject almost to constant change, Mr. Hedlund. We announced a low sulphur coal program early in March. We announced an additional modification of that low sulphur coal program or fuel program, I should say, later in March. Recently the mayor introduced a new Chicago ordinance or a proposed new ordinance further limiting sulphur output. This will further modify our future program.

Moreover, neither I nor anyone else knows what the future of the oil import situation may be. I have given you a figure of 1.4 equivalent tons of oil. That represents the oil we expect to get for the generating stations, plus a minor amount for our peaking units.

[1591] As we all know, the oil import picture is in a very uncertain situation. I don't know what the Administration is going to propose with respect to oil import quotas, so that I really am simply giving you a figure that represents today's figures unchanged for oil and for gas, a little less than we have today, simply on the assumption from everything I have read in the papers that probably we won't be getting much gas sometime in the future, but maybe we will.

If it is available, we certainly will be burning more gas and more oil than we are now.

Q Just based on the figures that you gave me, of the 35 million tons of coal equivalent, actually about 40 percent of that total will be coal, is that correct?

A That is our expectation.

Q Is it fair to say, Mr. Corey, that you cannot predict with any real precision what your fuel mix is going to be in the next five years as it relates to coal, oil and gas?

A That's right.

Q I believe you have stated that Dresden 1, your first nuclear plant, went on stream in 1960. When did you order that plant?

A 1955.

[1592] Q At the time you ordered it, what were the reasons that led you to that decision?

A We thought nuclear power was a bright new idea and we wanted to be in the forefront of its development. We have been working with Argonne National Laboratory and the Atomic Energy Commission since 1950, or approximately 1950. We had a study team working on the development of the concept of the boiling water reactor, which we finally ordered in 1955 for our Dresden station.

Q In terms of results at Dresden 1, has it been satisfactory with respect to safety and the reliability of performance?

A Yes. Extremely so.

Q Has it been satisfactory with respect to cost?

A Yes. This requires a little qualification. This was a "Model T" unit in the sense that it was intended to be a full scale unit but not a unit benefiting from improvements in technology which we hoped at the time would reduce full burn-up, increase the kilowatt hour output per pound of uranium burned, which would eventually cut costs.

When we ordered Dresden 1, we had some targets in mind and it met the targets.

Q What about your experience with Dresden 1 [1593] in terms of its flexibility in meeting changes in load-up requirements?

A It has been very satisfactory in that respect. It has been more flexible than a large coal-fired boiler would be.

Q Can you explain that, sir?

A Well, it can move up and down faster and follow load changes better.

Q With respect to the other units which you have under construction or have announced, could you tell me, please, generally, what your reasons were for ordering these nuclear plants?

A Well, at the time the first one was ordered, that is Dresden Unit 2 was ordered on February 5, 1965, and during the ensuing 18 to 24 months, we ordered the remaining units, Dresden 3, Quad Cities 1 and 2, and Zion 1 and 2, and during that period it appeared that whereas we can't be terribly precise about these things, in trying to project a cost of a unit which may not be completed for five or six years, we recognize we were dealing with estimates, but we felt the costs were very close between nuclear and the coal-fired units, and in which we felt that the nuclear units had a bit of an edge, something on the order of a quarter to a half a mil per kilowatt hour in cost advantage.

[1594] Since then, why, so many changes have occurred, changes in the cost of money, changes in the whole picture with respect to the environment and the possibility of having to spend very large amounts of money to remove sulphur from Illinois coal or to bring in coal from Wyoming or Colorado or Montana, that I find it hard to feel that today we can predict these costs even of these existing units that are under construction with the kind of accuracy that I thought we could predict in 1965 and 1966. But it certainly appears that the costs are very close. Moreover, today, as well as in 1965 and 1966, when we were ordering these units, we have a strong incentive to lean towards nuclear, because it is cleaner. It doesn't produce any fumes, any fire ash or sulphur dioxide. That is a nuclear-powered station does not. We had this definitely in mind when we ordered the units, the nuclear units, in 1955 and 1965.

THE COURT: We will take a short recess.

(A short recess was had, after which the following further proceedings were had herein, to-wit:)

[1595] THE COURT: Off the record.

(There was an off-the-record discussion, after which the following further proceeding were had herein, to-wit:)

THE COURT: You may proceed.

MR. HEDLUND: Could I have the witness' last answer? I think I can carry on without it.

THE COURT: You were interrogating on Dresden No. 2, Dresden No. 3, and the comparative efficiency of them, according to my notes.

BY MR. HEDLUND:

Q Mr. Corey, over, say, the last ten years, and without going into specific details, could you tell me whether or not the construction costs of your nuclear stations have increased beyond that for coal-fired stations, not increased as much or stayed about the same

A Well, for the—well, that is a large order in one question, Mr. Hedlund, but costs were declining for some time. That is the economics of scale in the power plant field were offsetting the costs of construction cost inflation, and this held true generally through the fifties, and into the sixties, up until the completion of our Joliet and Kincaid units, two units at Joliet and two units at Kincaid, which were placed in service in [1596] 1965, 1966, 1967 and 1968; and these four units represented sort of a low point in the construction costs, and since then construction costs have been rising, and they have risen for both nuclear and coal-fired units, and up until a few weeks ago I would have said to you without any question that they are going up about evenly.

In fact, I testified to that effect in our rate case last fall, that the low point for construction costs of coal-fired units was roughly $120 a kilowatt, and at about the time that low point was reached we ordered Dresden 1 and 2 and Quad Cities 1 and 2 from General Electric Company on a turn key basis under contracts which will enable us to complete those four units at roughly $120 a kilowatt, including all overheads.

Since then the costs have escalated so that the Zion units which are not being built on a turn key basis but which are being built by us and by the various contractors contracting with us—

Q Excuse me for interrupting, but these are the nuclear units, the Zion?

A Yes, nuclear. They are now budgeted on something on the order of $185 per kilowatt to $190 a kilowatt, and the Powerton 5 unit, a coal-fired unit which is scheduled

for service at just about the sametime, [1597] but which is being built on a slightly accelerated schedule, is budgeted at about $215 a kilowatt.

That is a coal-fired unit, and so I did testify and did feel with respect to those units that we had about a 50 or 60 percent cost escalation since 1965 on both coal-fired and nuclear units.

[1598] Now, we have taken bids on nuclear units for 1976 and 1977 service and anticipating further cost increases and, of course, all of these estimates include prospective cost increases through to the service date, and we find we may be talking about costs on the order of $300 a kilowatt, but our estimates of coal-fired unit costs don't show quite as much of an increase in construction costs.

I do not have the figure in mind as to what we are estimating coal-fired units, but I do know that all costs considered, including the cost of removing sulphur dioxide from the stacks of sulphur from the coal or of bringing in low sulphur Western coal result in the over-all cost per kilowatt being just a trifle higher or neck and neck, as I said a little while ago, with nuclear despite the increased construction costs on the nuclear.

Q Could you tell me why Edison decided to build Powertown No. 5, the coal-fired unit?

A Yes, we needed additional capacity for 1972, and we didn't have any way of building a nuclear unit in time to meet it. The alternative would have been to buy more gas or oil fired peaking capacity, that is gas turbines gas or oil-fired turbines or gas engines, and we had [1599] already bought about a million and a half kilowatts of that sort of capacity and felt we didn't need any more of that peaking capacity, and we wanted a base load unit, and the coal-fired base load unit was the only one that could be built in time.

The reason we were short of capacity was a combination of factors but, primarily, the delays in bringing our nuclear units into service.

Q Has Edison contracted for the coal to supply Powertown?

A Well, yes, certainly.

Q Are you familiar with that contract and with whom it is?

A I am just in a general way familiar with the fact we have contracted for coal to supply Powertown from the Carter Mine to be operated by a subsidiary of Humble Oil Company in Illinois.

Q Do you know what the length of that contract is and the tonnage is to be supplied each year?

A I might be able to refresh my memory. If you want me to take a look and see if my notes will tell me—

Q If I might try to refresh your recollection, might I suggest to you that the contract runs initially [1600] for ten years at about 3 million tons per year and with two five-year renewal options. Would that coincide with your recollection of that contract?

A Yes.

Q Mr. Corey, you have testified to some degree of comparable costs between nuclear and coal, and you testified to the air pollution considerations as they are applied to coal.

I would like to ask your opinion as to the future of nuclear-fired units or nuclear fuel units in the electrical utility industry and, by the future, I ask over the course of the next ten years.

A Well, as far as Commonwealth Edison is concerned, we have sort of put our eggs in the nuclear basket. We believe that nuclear power is the best way to provide base load electric generation, and we intend to move in this direction.

On the other hand, we don't intend to completely forget coal, and we do intend to look at the possibility of a coal-fired alternative every time a decision comes up, but I believe that we will—well, the very fact we have just announced that our 1976 and 1977 units will be nuclear indicates that we believe this is the best way to take care of our massive [1601] electric power generation problems with a minimum of disturbance to the environment.

Q Is Commonwealth Edison participating in the development of the breeder reactor?

A Yes.

[1602] Q Could you describe briefly your participation in that?

A We have engineers assigned to work with both Westinghouse and General Electric Company, and both Westinghouse and General Electric Company have breeder projects going forward, breeder research and development projects, studies going forward, and we are contributing to each of these projects.

We are also privileged as a result of our taking part in each of these projects also to sort of look over the shoulder of General Electric Company and its partners in a project for the construction of a prototype breeder down near Fayetteville, Arkansas, which I believe is almost completed, if it is not completed.

We have our engineers who are assigned to these breeder projects come back and brief the top management once a month or thereabouts in detail as to the outlook for the future.

I expect that within the next year or so the Atomic Energy Commission will select one or two commercial scale breeder projects to be built and tried out, and I would not be at all surprised if we were a member of the group selected.

Q Mr. Corey, there is already in evidence in this [1603] case a number of announcements by Commonwealth Edison in terms of its, if I may paraphrase it, environmental program in the city of Chicago, in which such things have been mentioned as the increased use of natural gas, the retirement of coal-burning facilities, the increased use of low sulphur oil and the use of low sulphur coal.

Taking these programs into consideration as far as your stations in the Chicago area are concerned, could you quantify the amount of high sulphur coal that will be displaced by these various programs in the Chicago area that will be followed by Edison?

MR. CUSACK: Your Honor, I think Mr. Hedlund should indicate what he means by "the Chicago area," or at least ask the witness what he means by it.

BY MR. HEDLUND:

Q Mr. Corey will explain.

In terms of the stations in the Chicago area that would be affected by this program, is what the question is directed at.

A Well, the best way I can quantify this is to say that based upon the programs we have announced, that is the programs for bringing in low sulphur western coal, for bringing in some medium sulphur west Kentucky [1604] coal, for converting Ridgeland station to oil and for burning more gas—based upon those programs, our guesses at the moment are that instead of burning something on the order of 18.5 to 19 million tons of Illinois coal a year, we may by next year be down around 11.5 to 12 million tons.

Another way of putting it is to say that we probably are displacing at least 5 million tons, annual tonnage, with several things—with 2 million more tons gas, 1.25 million more tons of oil, and at least 4.5 million more tons of low sulphur coal from outside Illinois.

[1605] Now, of course, those things add up to more than 5 million tons; but we also have some growth in our electric usage. We will be using a lot more uranium. But so far as the Chicago area is concerned we have got the additional oil, the additional gas, and the low sulphur coal from the west, and over a period of a couple of years it will be at least 5 million tons displacement.

Q And the 5 million tons displaced would be, would it not, high sulphur Illinois coal, that is, coal with a sulphur content of 2.5 percent or greater?

A Yes.

Q If I may ask you to go back to 1967, 1968 and 1969, in that general period, would you tell me approximately what percent of the coal produced in the State of Illinois was consumed by Commonwealth Edison?

A Roughly 25 percent.

Q Is there any other investor-owned utility in the country that you know of that consumes more coal than Commonwealth Edison?

A No. I don't believe I have made an outright comparison with American Electric Power Company, and I am not sure when you said "company" whether you were referring to holding company or operating company. [1606] American Electric Power Company produces more kilowatt hours than we produce, and they are a largely coal-fired generating company. So taking all of their

subsidiaries for their entire system, I would suppose that they use more coal than we do, but I haven't checked it.

Q Mr. Corey, do you recall an interview on which you and Mr. Ward and Mr. Behnke participated in that was published in "Nucleonics Week"?

A Yes. Are you sure it is Behnke and not Ayres?

Q It appears to be Behnke. To refresh your recollection on that and then to ask you some questions about this interview, I want to show you what has been received in evidence as Defendants' Exhibit 93. This document has an excerpt from "Nucleonics Week" for April 4th, April 11th and April 18th.

I direct your attention—

A 1968?

Q 1968, yes. I direct your attention to the third page of this document, which is the second series of this interview, and to the third paragraph on the page that starts as follows—this article purports to quote the substance of the remarks made by yourself and the other two gentlemen, and I wish to ask you after I have read it whether it accurately reflects the [1607] substance of those remarks at the time.

The third paragraph says:

> "You cannot buy coal now for such a plant without buying it on virtually a cost plus basis. Our policy is to buy it on five to ten year contracts. Coal is not a great big capital investment business. About all you do when you buy it is pay what it costs a man to get it out of the ground. We believe we can do better by buying it not from year to year, but in five or ten year intervals. That way we can buy from the most efficient miners, the ones who have the best people and are doing the best job at any given time."

Is that an accurate reflection of the remarks made by yourself and the other gentlemen during that interview?

A Yes.

[1608] Q Directing your attention to the last full paragraph on that page, which states as follows—

MR. CUSACK: Your Honor, the Government objects

to Mr. Hedlund's not reading the last sentence of that paragraph into evidence.

THE COURT: You mean in the third paragraph?

MR. CUSACK: Yes, your Honor. He should ask the witness the entire question and not take it out of context. It is obviously taken out of context as he read it and propounded the question to the witness.

THE COURT: Include it.

BY MR. HEDLUND:

Q The paragraph concludes:

"If we were to pick out one company and say, 'We are going to give you a long contract,' obviously he'll retort, 'Well, I will give you the best price I can, but I have to have escalation,' and then you end up with cost plus."

With that added, do the remarks now that I have read accurately reflect the remarks of yourself and the other gentlemen during that interview?

A Yes.

Q Directing your attention to the last full paragraph on that page, it states as follows:

[1609] "But once you get a mine-mouth plant, you absolutely have to contract for coal to supply it. The capital cost on the plant is $120 million. The capital cost on the mine is about $10 million. Obviously you can't be put in a position with a $10 million investor that holds you up because you have your big $120 million plant sitting beside his mine. So for all practical purposes, you have to buy the mine."

Is that an accurate reflection of the remarks made by yourself and the other gentlemen during this interview?

MR. CUSACK: Your Honor, Again the Government must object. He did not read the complete paragraph. I think the remaining sentences are imperative that they be asked.

THE COURT: Include them.

MR. CUSACK: He refers to one mine. I think the paragraph ought to be finished.

MR. HEDLUND: I think this can be done on cross examination, but I will finish it.

BY MR. HEDLUND:

Q It continues:

"That is the situation with our mine-mouth [1610] plant. We made a long-term cost plus contract for the coal. It runs to 1982; with three 10-year renewal options, that will take us to the year 2012. The need to protect your investment in a mine-mouth plant may give a false impression that longer term coal contracts result from the competition with nuclear fuel."

Is that paragraph an accurate reflection of the remarks made by yourself and the other gentlemen during that interview?

A Yes.

Q Is the contract referred to therein the contract which you previously have testified with respect to the subsidiary of Humble Oil?

A No. That is the contract with Peabody for Mine 10.

[1611] Q In your judgment, Mr. Corey, for the energy system of Commonwealth Edison, will nuclear energy continue to compete with coal?

A I don't understand the question.

Q Let me rephrase it. In your opinion, for the fuel business of Commonwealth Edison, the fuel requirements or energy requirements of Commonwealth Edison, will nuclear energy continue to compete with coal?

A Yes.

Q Mr. Corey, the evidence in this record indicates that Freeman and United Electric Coal have been affiliated companies since at least 1959. To your knowledge has that relationship had any adverse effect on Commonwealth Edison?

A No.

Q Assuming that United Electric neither owns nor produces coal having a sulphur content less than 2.5 percent and assuming that United Electric has sold or oth-

erwise committed all but approximately 4 million tons of its mineable reserves spread among its four existing mines, would the continued common ownership of Freeman and United Electric in your opinion have any adverse effect upon Commonwealth Edison?

[1612] A No.

Q In your opinion, Mr. Corey, what is Commonwealth Edison's major concern with respect to competition among its fuel or energy suppliers?

A I guess it is to have adequate competition and as the energy field gets more diverse, it is hopefully to continue to have effective competition between coal and oil and nuclear. I believe that is one way of putting it.

Another way of putting it is that we have some very, very, very large companies moving into both the coal field and the nuclear field, and I am referring to Humble Oil getting into the coal fields in Illinois. And I am referring to the large oil companies getting into the nuclear business. I am including Conoco—and what is small for an oil company is large for anyone else—Kerr-McGee, Gulf, Gulf General Atomics.

With these things taking place and coupling this with what we saw, how difficult it was for us to get very much effective competition from foreign oil, since it took us almost five months just to get permission to import a little foreign oil for one of our stations, I would say it is important that we continue to have a diverse number of capable financially-responsible [1613] competitors in the energy business so that they are able to compete with the kind of new entrants into our fuel business.

I really would hate very much to see that we had to turn for coal, oil and uranium to just two or three major oil companies. We might then find that we did have a very distinct lack of competition.

MR. HEDLUND: Thank you. That is all I have.

THE COURT: Are you ready to proceed now, or do you desire to recess? Will that expedite your cross examination?

MR. CUSACK: I think it might, your Honor.

THE COURT: We will recess, then, until 2:00 o'clock. Prepare your questions accordingly.

MR. HEDLUND: May we be off the record, your Honor.

THE COURT: Off the record.

(There was an off the record discussion after which the following further proceedings were had herein, to-wit:)

THE COURT: We will recess now until 2:00 o'clock.

(At 12:15 o'clock, a recess was taken until 2:00 o'clock p.m. of the same day.)

• • • •

AFTERNOON SESSION 2:00 P.M.

• • • •

[1623] GORDON R. COREY,

called as a witness by the defendants herein, having been previously duly sworn, resumed the stand and testified further as follows:

CROSS EXAMINATION

BY MR. CUSACK:

Q During your direct examination, Mr. Corey, you testified in regard to the commitment of Commonwealth Edison to nuclear plants in the future. You stated that Commonwealth Edison does not intend to completely forget coal and that you will look at coal-fired alternatives every time, is that correct, sir?

A Yes.

Q Is it true, Mr. Corey, that the Commonwealth Edison Company recently has petitioned the Illinois Commerce Commission for permission to set up a fuel subsidiary?

A Yes.

[1624] MR. CUSACK: I ask the reporter to mark for identification as GX-135 a 6-page document entitled "State of Illinois, Illinois Commerce Commission, Commonwealth

Edison Company Application for Authority to Cause to be Formed and to Invest in a Subsidiary Corporation to Conduct Certain Activities Ancillary to its Public Utility Business."

(The document was thereupon marked as GX-135 for identification.)

BY MR. CUSACK:

Q Mr. Corey, I hand you what has been marked as GX-135 and ask you, sir, if you please could identify that document?

A Yes. That is Commonwealth Edison's petition to the Commerce Commission for permission to establish a subsidiary.

Q This is the fuel subsidiary, sir?

A Yes.

[1625] Q And this petition is dated March 26th, is that not correct, sir?

A Yes.

Q Excuse me. What is the date of the petition?

A March 26, 1970.

Q Now, the petition states in part, Mr. Corey, at page 1, numbered paragraph 3:

> "Fossil fuel procurement has become increasingly difficult. The growth of nuclear power has had the effect of making coal mine operators reluctant to open new coal mines in and near Edison's territory."

Is that correct, sir?

A Yes.

Q Mr. Corey, is it true that a subsidiary of Commonwealth Edison Company is at the present time acquiring coal reserves in Menard County, Illinois, near the town of Petersburg?

A I am not acquainted with the location, but we are acquiring coal reserves.

Q Are these reserves being acquired, sir, by a corporation named PIAMCO, Incorporated?

A Yes.

Q Is this company headquartered in St. Louis?

[1626] A Yes.

Q Would it refresh your recollection, sir, if the land subsidiary of PIAMCO was called the Menard County Land Company?

A I don't know.

Q This corporation is in the charge of Mr. Snyder, isn't that correct, sir?

A That's right.

Q Formally of the Peabody Coal Company?

A Yes.

Q Mr. Robert Snyder?

A Yes.

Q Can you tell us, Mr. Corey, approximately how many tons of coal Commonwealth Edison Company plans to acquire through PIAMCO?

A I don't know.

Q Can you give us an approximate number?

MR. HEDLUND: At this point, your Honor, I am going to object. I believe further inquiry along this line is outside the scope of my direct examination.

THE COURT: The objection is sustained.

[1627] BY MR. CUSACK:

Q Mr. Corey, is it contemplated that when air pollution control devices are developed, Commonwealth Edison Company will strip mine the coal reserves being acquired through PIAMCO?

MR. HEDLUND: Same objection, your Honor.

THE COURT: How is this within the scope of the direct examination? All we are dealing with here is the sole question as to whether or not they are acquiring reserves, as indicated on direct examination, because there was a scarcity.

Now, the amount and all of this new matter, I don't see how that is relevant.

MR. CUSACK: What I am attempting to determine, your Honor, is whether or not Commonwealth Edison Company has plans for the future development of these coal reserves it is acquiring in Illinois and what it plans to do with these reserves going to the general problem or the question of the nuclear versus coal commitment of Commonwealth Edison Company for its electrical generating stations.

THE COURT: Do you have any response?

MR. HEDLUND: Again, I do not believe—well, your Honor, the petition, in a sense, covers it on its face in [1628] terms of the statement that it does not plan to mine this coal until air pollution devices are available.

Now, I believe this witness has testified on direct examination that they are not going to forget coal. The petition, I think, on that score speaks for itself.

Obviously, if they are going to acquire coal as well as other forms of fuel and other aspects of this petition, I think it is reasonable to assume that indeed Commonwealth Edison is not going to forget coal.

[1629] But I would argue that going into the minutia of this and the details of the coal, and so forth, is outside the scope of the direct examination.

THE COURT: The objection is sustained. Proceed.

CROSS EXAMINATION

BY MR. CUSACK:

Q Mr. Corey, approximately how many tons of coal were purchased and consumed by Commonwealth Edison Company in 1950?

A I don't remember.

Q Do you have any idea, sir?

A I am trying to think. It would be, at best, a wild guess. 1950?

Q Yes, sir.

A Well, it is somewhere between five and ten million tons.

Q Would it be under 10 million tons?

A I am not certain.

Q In 1960, sir, how many tons, approximately, of coal were consumed by Commonwealth Edison Company?

A Well, I would again—well, it is between twelve and fifteen million.

• • • •

[1632] Q Excuse me, the Kincaid Station, and is that the only minemouth generating station of Commonwealth Edison Company at the present time?

A Yes. May I now correct, for the record—I have finally located the precise figure on coal for 1969. It was 18,800,000 tons.

Q Thank you, sir. Sir, since 1950 the Commonwealth Edison Company has built the Ridgeland generating station, is that correct, sir?

A Yes.

Q This was originally built as a coal-fired station and has now been switched to oil, is that correct?

A It is being switched to oil right now, hopefully by July 1 of this year.

Q And the net generating capacity of the Ridgeland Station is about 337,000 kilowatts, is that correct, sir?

A That sounds right to me.

Q In 1951 Commonwealth Edison built the Waukegan generating station, is that correct, sir?

A No, it built a unit at Waukegan. Waukegan has been there 40 years.

Q Is Waukegan a coal-fired station, sir?

A Yes.

Q What is the approximate generating capacity of [1633] Waukegan?

A I can look it up. I would guess about 1,700,000 kilowatts. That is again my estimate.

If you want a precise figure, I will check it for you.

Q Commonwealth Edison Company owns the Dixon generating station, is that correct, sir?

A Yes.

Q Is that at Dixon, Illinois?

A Yes.

Q Is this a coal-fired station?

A All of these stations you are referring to are coal-fired, but both Dixon and Waukegan also burn gas.

[1634] Q How much gas is burned, approximately, in Waukegan, as a percentage of the total energy of that station?

A I would guess about a third.

Q And what would the figure be for Dixon, sir?

A I just don't remember. It is probably on that order, a quarter to a third.

Q Is the gas burned at Dixon and at Waukegan interruptible gas?

A Yes.

Q And available then only in the summer?

A Generally, yes.

Q In 1955 is it correct, sir, that Commonwealth Edison Company constructed the Will County Generating Station around that time?

A In 1955, yes.

Q And that is a coal-fired station, sir?

A Yes.

Q What is the approximate kilowatt capacity of that station? Would it refresh your recollection if I said 328,000.

A That was what was built in 1955, but we also built a unit in 1957 that was 280,000 kilowatts, roughly, and then we built another unit in 1963 that was about [1635] 360,000 kilowatts, I believe, so it is about a million kilowatts.

Q And that is a coal-fired station, sir?

A Yes.

Q In 1955, Commonwealth Edison built the State Line generating station, is that correct, sir?

A It built one unit in 1955. The station itself was started in 1929. Mr. Insull built the first two units there, I believe.

Q Is this a coal-fired station, sir?

A Well, again, it burns a lot of gas but it burns both gas and coal.

Q Is it interruptible gas which is burned at this station?

A Yes.

Q Approximately what percentage of the total energy consumed at the State Line station is coal?

A I really don't have these figures in my mind. I would say roughly a quarter to a third, but when I say that I am just picking the figure out of the air, Mr. Cusack.

Q Would it be any more than a third?

A I doubt it.

* * * *

[1638] Q You are putting in a foundation and a chimney, is that correct, for another unit?

A I don't know about the foundation. We are leaving space for another unit, and we are trying to get permission to build the stack high enough and large enough so that it will take two units.

Q Would you anticipate, sir, that if another unit is built at Powerton, that is Powerton No. 6, that this would be a coal-fired station?

A Yes. Not necessarily, though, Mr. Cusack, but this would be a strong possibility.

Q Would it also be a strong possibility, Mr. Corey, that Commonwealth Edison Company would construct in the next ten or fifteen years additional minemouth coal-fired generating stations?

A Well, it is certainly a possibility. You see, I just —at the moment I have just been going through an evaluation of coal versus nuclear for the two units we talked about this morning, and we came out on the nuclear side, and with environmental considerations what they are, I have to say that the chances were very—were preponderantly against the construction of a coal-fired station.

Q Mr. Corey, Commonwealth Edison Company is making [1639] great efforts, is it not, to control emission from coal-fired stations, is that correct, sir?

A Yes.

Q And the 1969 annual report of Commonwealth Edison Company states that:

> "Commonwealth Edison Company has already spent $53 million on facilities to prevent contaminants from getting into the air."

Is that correct, sir?

A Yes.

Q And Commonwealth Edison Company also has plans to spend substantial additional sums, does it not, on air pollution control devices?

A Yes, we have plans to spend about 160 to 170 million dollars on air and water pollution control specifically without respect to nuclear in the next few years.

This is with respect to sulphur dioxide to remove it.

Q Directing your attention, sir, to the coal-fired units of Commonwealth Edison Company, approximately how much money has already been spent to control pollution at the Commonwealth Edison Company coal-fired units?

MR. HEDLUND: Your Honor, I am going to object to [1640] the phrasing of that question because I think it is misleading. There are a number of ways of controlling sulphur dioxide emission from a coal-fired station. One way is to convert it to oil. Another way is to burn less coal or to burn low sulphur coal, and I submit that the question phrased is incapable of answer unless you parse it out in terms of what you are doing and then what you are doing as to cost.

THE COURT: Rephrase your question, Mr. Cusack.

[1641] BY MR. CUSACK:

Q Mr. Corey, at the present coal-fired generating plants of Commonwealth Edison approximately how much money already has been spent on pollution control devices?

A Are you speaking of air pollution?

Q Yes.

A I believe it is the $53 million figure you just referred to in the annual report.

Q Can you give us an approximate sum of money that Commonwealth Edison Company plans to spend on its present coal-fired generating stations?

A Well, I mentioned—

MR. HEDLUND: I object again. I don't think that is a question. Spend for what?

BY MR. CUSACK:

Q For pollution control devices.

A I just mentioned $170 million for air and water pollution in total, and I really don't remember how that is split between water and air. I do know that some of it applies to cooling water devices at nuclear plants, so I can't say that is directly responsive to your question.

If you want something right off the top of [1642] my head, and taking your question as a question with respect to air pollution, and including sulphur removal and the like, I would say on the order of $50 million.

This again is not a considered figure. It is a rough

approximation of what I think is in that $170 million figure.

Q It is a fact, is it not, Mr. Corey, that Commonwealth Edison Company has been a leader in electrostatic precipitators on coal-fired generating stations?

A Yes.

Q And it is a fact that Commonwealth Edison Company led in the development of these devices as far back as 1929?

A Yes.

Q And is it not also a fact, Mr. Corey, that Commonwealth Edison Company has been heavily engaged in research in regard to sulphur emission devices, control devices, on coal-fired stations?

A Yes.

Q And you have done work, have you not, with the Humble Oil Company in this regard?

A Yes.

[1643] Q Now Mr. Corey, approximately how much money already has been spent by Commonwealth Edison Company in the development of sulphur dioxide emission control devices on coal-fired stations?

A I don't know.

Q Could you give us an approximate figure?

A I just am not able to approximate it.

Q Do you anticipate that within the next five years, Commonwealth Edison Company, either by developing the equipment itself or by developing it in concert with others, will be able to achieve or will be able to develop an acceptable SO_2 emission control device on its coal-fired stations.

MR. HEDLUND: Your Honor, I think there are two questions in there. My confusion is with the "achieve" or "develop".

THE COURT: I think they are nearly synonymous. He may answer. It is clear to the witness.

BY THE WITNESS:

A Yes.

BY MR. CUSACK:

Q Mr. Corey, when these devices are developed, do you anticipate that Commonwealth Edison Company then will be able to continue to utilize high sulphur [1644] Midwestern coal?

A Yes, but I don't quite like your using the word "continue". We intend to reduce the sulphur content of the coal we burn in accordance with the ordinances and cut well below the requirements in the ordinances that are now in effect and are pending, and if and when we get good sulphur removal processes, then I certainly would expect that we would and should return to using Illinois coal. But not until that time happens. I am quibbling over the word "continue".

Q I understand. And based on your belief in the future of Illinois coal, Commonwealth Edison Company is in the process of developing coal reserves in Illinois which will be used when Comomnwealth Edison Company develops these devices, is that correct?

A Acquiring coal, you say?

Q Acquiring coal.

A Not developing.

Q Is that correct, sir?

A That's right.

Q During your direct examination, Mr. Corey, Mr. Hedlund asked you in regard to some statements made in Defendants' Exhibit 93, the interview in the "Nucleonics Week" magazine of April 4, 1968, between you, Mr. Ward [1645] and Br. Behnke.

Mr. Hedlund asked you in regard to paragraph 3 on page 5 of this exhibit, which I hand you, and the last sentence in that paragraph reads as follows:

> "If we were to pick out one company and say 'We are going to give you a long contract', obviously he will retort, 'Well, I will give you the best price I can, but I have to have escalation,' and then you end up with cost plus."

Mr. Corey, isn't it true that most of the coal contracts to supply Commonwealth Edison Company do have escalation clauses?

A Yes.

[1646] Q Could you tell us very briefly what this escalation consists of?

A It has been a long while since I worked on those clauses, but they generally are rather informal type clauses that provide for consideration of escalation in labor costs, in material costs, changes in—well, there was no provision for changes in productivity so I will strike that. Also consideration of changes in the coal market and changes in taxes and miner's royalties—that is United Mine Workers royalty provisions.

However, the clauses are not automatic clauses. They are clauses which provide for periodic negotiation based on a renegotiation of the escalation provisions based upon consideration of these factors. It worked quite well.

Q Mr. Corey, isn't it true that most of the long-term coal contracts of Commonwealth Edison Company are constantly undergoing renegotiation?

A I didn't realize it, but there is a fair amount of, from time to time, changes or extensions in the contracts. Our principal problem the last couple of years, however, has been to get performance. Everyone in the United States is short of coal and we just aren't getting the coal that is provided for in the contracts.

[1647] That, incidentally, does not apply to United Electric. They are one of the few contracts that we have had that we have had almost complete performance under.

Q It is a very fine company, isn't it?

MR. HEDLUND: Your Honor, I would like to hear that answer.

THE COURT: Are you moving to strike it?

MR. HEDLUND: No, I don't think so. I would like to hear it back.

THE COURT: Read the answer, please.

(Record read by the reporter.)

THE COURT: You may proceed.

BY MR. CUSACK:

Q United Electric is a very fine company, isn't it?

A I guess so.

Q Isn't it true, Mr. Corey, that for a number of years Commonwealth Edison was almost solely dependent upon coal as a source of energy?

A Yes.

Q And isn't it true, Mr. Corey, that in the future coal will be a very important source of energy to the Commonwealth Edison Company? Given, that is, [1648] the development of SO_2 pollution control devices?

A Yes.

Q In your direct examination, Mr. Hedlund asked you for the years 1967, 1968 and 1969 about the approximate percentage of Illinois coal production consumed by Commonwealth Edison. The evidence in this case shows that in 1967 total Illinois coal production was 64,814,000 tons. The evidence in this case also shows that in 1967 the total coal production in Illinois, Indiana and west Kentucky was 129,500,000 tons.

Approximately what percentage of this production was consumed by Commonwealth Edison Company in 1967?

MR. HEDLUND: I will object. I believe that question implies that there was consumption by Commonwealth Edison Company in those years of coal from Indiana and west Kentucky. If it does not imply that, he is just asking Mr. Corey to make a mathematical computation, and I object on that basis.

THE COURT: It is not clear.

MR. CUSACK: I will connect it up, your Honor.

THE COURT: I say your question is not clear. It is not clear how you are applying it to them, to all of these different states. Do you have the figures? If you do, give Mr. Corey the figures, and ask if they bought coal from those states.

[1649] BY MR. CUSACK:

Q Mr. Corey, I direct your attention to GX Weir Deposition Exhibit 1, which is a map entitled "Illinois-Indiana-West Kentucky Shipping Coal Mines, January 1969."

Mr. Corey, is it a fact that the Commonwealth Edison Company generating stations purchased coal from throughout the area set out on this map?

MR. HEDLUND: I will object unless Mr. Cusack takes that in terms of specific generating stations. I think it is misleading to lump the purchases for all generating stations in such a manner.

THE COURT: The objection is overruled. He may answer. He may answer if he knows.

THE WITNESS: What is the question?

(Question read by the reporter.)

BY THE WITNESS:

A In what period?

BY MR. CUSACK:

Q At the present time.

A Well, not exactly. I don't think we are taking any Indiana coal. I could be mistaken with respect to an insignificant amount, but I don't think we are taking any Indiana coal at the moment.

[1650] Until we contracted for some west Kentucky coal recently because we thought we could get some with a lower sulphur content down there and have been fairly disappointed about it, we haven't been taking any West Kentucky coal recently. We have during the early 1960's taken some from the River Queen Mine on the Green River in West Kentucky, but generally we have not been taking West Kentucky coal except occasionally to make up shortages.

Q Do you anticipate that Commonwealth Edison Company will in the next few months be increasing its consumption of west Kentucky coal?

A Yes. We are in a fair spot, however, on that. We as an interim measure tried to some buy some West Kentucky coal, and it is a medium sulphur content, and it is 2.5 percent sulphur, and this is not low sulphur, but it is lower than Illinois, and we got it for that purpose. But it will not meet the proposed provisions of the new Chicago ordinance. Whether we take that coal or not I am not sure what we are going to do.

Q Mr. Corey, in the last ten years, Commonwealth Edison Company has purchased coal from mines located in Indiana, is that correct, sir?

A I am quite sure sometime in the last ten years, [1651] yes, but not very much. You see, we anticipated buying a good deal of Indiana coal from the Lynnville Mine of Peabody. That was about 10 years ago. We started a unit train operation, but it never worked out, because we were stopped from crossing the EJ&E tracks and had to change the whole plan.

Q It is true that Commonwealth Edison at the present time does purchase coal throughout the Illinois coal field, is that correct, in the state of Illinois.

A Well, fairly widely. That is a pretty broad statement, Mr. Cusack. We buy from a lot of different Illinois mines.

Q Mr. Corey, do you consider that the Commonwealth Edison Company is in a position to overreach the midwest coal producers in negotiating with these coal producers?

A I don't understand the question.

Q Do you consider that the Commonwealth Edison Company is in a position to bargain unfairly with the mid-west coal producers in negotiating for the purchase of coal from these producers?

A I thought that we were the fat boy, but we bargain as well as we can and try to hold our own. I don't believe that we bargain with coal producers, though. We bargain with individual suppliers.

[1652] Q Mr. Corey, do you believe that the Commonwealth Edison Company's purchasing power in the acquisition of energy resources creates an unfair advantage over the Midwest coal producers?

A No.

Q It is true, is it not, Mr. Corey, that the Tennessee Valley Authority purchases more coal than the Commonwealth Edison Company?

A Yes.

Q Do you believe that Commonwealth Edison Company in its purchases of coal is in a better, a worse or about the same position as TVA?

A You mean as to its bargaining position?

Q Yes, sir.

A I think about the same.

Q Would your answer be the same with regard to Union Electric?

A I assume so. I am not quite clear what you mean. I assume what you really are saying is can we buy as effectively or can we bargain as effectively as TVA or Union Electric, and I think the answer is yes.

Q Do you believe that Commonwealth Edison can bargain more effectively than TVA?

A In one respect, and in one respect only, and [1635] that is that TVA is restricted in its bargaining by some rules which are generally applicable to Government buyers and not to private buyers. These rules pertain to such things as public opening of bids, and things like this, which in my opinion are not so much designed to protect the rights of the buyer as to protect the rights of the seller.

There are many rules that apply by custom and by law to Government buyers which are designed to ensure that all of the constituents of the Government have the right to deal with it on equal terms. There are no such rules binding a private buyer. So we don't have to publish all of the bids, and therefore I believe we are able to bargain a little more effectively.

This has been a matter of public record and long discussion before the Federal Power Commission in reference to proposed purchasing regulations. I believe the TVA is to some extent harmed by the regulations it has to operate under. I am very close to a number of the TVA people, and I believe they recognize this.

Q Mr. Corey, would Commonwealth Edison Company be in a better position to bargain with coal producers than the Union Electric Company?

A I suppose about the same.

[1654] Q Would your answer be the same with regard to Northern States Power?

A Yes.

Q Wisconsin Electric Power Company?

A Yes.

Q Mr. Corey, directing your attention to the nuclear commitment of the Commonwealth Edison Company and to GX-135, the petition of the Commonwealth Edison Company before the Illinois Commerce Commission, do you

anticipate, sir, that there will be a shortage of uranium in the late 1970's and early 1980's?

A I don't know. I don't think so. Certainly there will not be if the present embargo on foreign uranium is lifted.

[1655] Q Mr. Corey, the City of Chicago's proposed bill, proposed apparently by Mayor Daley, pertaining to the 1 percent sulphur limit on coal burned, refers only to the stations within the city limits of Chicago, is that right, sir?

A That's correct, but there are some more regulations pending with respect to stations outside.

Q With regard to the Zion stations, Zion 1 and Zion 2, is it true that the Metropolitan Sanitary District of Greater Chicago has a suit pending in which it seeks to prevent the operation of the Zion nuclear plant on the ground that its thermal and radiation emissions will pollute Lake Michigan?

A Yes, sir.

Q Is that case still pending?

A Yes.

Q In the event Commonwealth Edison Company builds cooling towers at Zion 1 and Zion 2, how much approximately do you think this will increase the cost of the stations?

A Oh, probably $50 million. This really is not a question of cost. To keep the record clear, Mr. Cusack, the problem is a problem of weighing one environmental problem against another. Cooling towers are very large [1656] and very bulky, and so far no cooling towers of this size have been built this far north. Cooling towers give off a large amount of steam and vapor, especially in the winter months, and it could occasionally cause icing and other problems.

We have had a clean bill of health from the Federal Water Pollution Control Administration, and we believe that the interest of the community best will be served by pursuing our plans at Zion. However, from the standpoint of the over-all economics, cost of the cooling towers is what I mentioned, about $50 million.

[1657] Q Mr. Corey, on your direct examination you were asked whether or not the merger of Commonwealth Edison Company—excuse me, the merger of United Electric Company and Freeman Coal Mining Corporation was harmful to your company.

Is it a fact, sir, that United Electric Company coal is consumed at your river stations outside of Chicago?

A Yes, it is consumed at river stations, both outside of Chicago and inside Chicago.

Q And isn't it true that Freeman also supplies coal for the river stations of Commonwealth Edison Company?

A Yes.

Q Directing your attention, sir, to the period prior to 1959, before Frank Nugent and the other Material Service representatives went on the board of United Electric, did you consider United Electric and Freeman to be competitors?

A Yes.

Q Sir, in regard to the coal-fired stations of the Commonwealth Edison Company, can nuclear fuel be burned at these stations?

A No.

[1658] Q Is it a fair statement to say, Mr. Corey, that for the coal-fired stations of Commonwealth Edison the principal competitors for the energy fuel of these stations are coal producers?

A Yes.

Q Sir, is it true that the major coal suppliers at present of Commonwealth Edison Company are the Peabody Coal Company, Freeman Coal Mining Company, United Electric and Southwestern Illinois?

MR. HEDLUND: I am sorry, your Honor; may I have that question read back, please?

THE COURT: Read the question.

(Question read by the reporter.)

BY THE WITNESS:

A No, I don't think you can say that because of our large low sulphur program, and the coal we have been buying lately, contracting for that is, from the west is com-

ing from various new suppliers, whereas in a sense we have been phasing out.

As you know, the United Electric contract expires this year and has not been renewed, our contract with United Electric. We have bought coal from, as I said, from west Kentucky. We have bought coal from Wyoming. We have bought coal from Montana, and these [1659] are from new suppliers.

What we are doing right now is looking at a number of other new suppliers, so that I think in the sense of the present competitive situation, that these are not the principal competitors. Certainly, they are the principal current suppliers of coal, except that you didn't name Consolidated, which is also a supplier through its Truax-Traer Division.

Q Sir, when Commonwealth Edison Company develops an effective SO_2 emission coal device on its coal-fired stations do you anticipate the companies which I have named and including the Consolidation coal will be the principal suppliers of coal for Commonwealth Edison?

A I don't know. It is a distinct possibility, but I find it hard to predict what will happen or what may happen if we are successful in developing good sulphur removal processes.

Q Is it true, Mr. Corey, that the western coal producers are not priced competitive with the Illinois coal producers at the present time?

A That is right. You mean western coal is more expensive delivered to Chicago, certainly, than Illinois coal.

Q How much more expensive, just generally?

[1660] A Well, it is at least 50 percent more and on a temporary basis as much as double, but we expect that when we get our unit train operations going from the west and the logistics worked out, we will have the price down to about 50 percent higher, more than Illinois coal.

Q Sir, in regard to the nuclear commitment of Commonwealth Edison Company, in your opinion is Edison is a better position to incorporate nuclear power in its system than a small electric utility?

A Yes, sir.

Q Sir, you stated that the first four of the six commercial sized units ordered by Commonwealth Edison,

Dresden 2 and 3, Quad Cities 1 and 2, were purchased from General Electric Company on a turn key basis, is that correct?

A Yes.

Q That means on a fixed price contract?

A Yes.

Q You also testified, did you not, sir, that the Dresden 2 plant went into operation last night, I believe?

A Well, it first produced first power last night. It is not, commercially speaking, in commercial service. A number of tests have to be done.

[1661] Q Is it true to say, sir, Dresden 2 is the first non-pilot nuclear power plant of Commonwealth Edison Company?

A I don't know—that requires a definition of pilot, and I don't consider Dresden 1 to be a pilot plant. I said it was a Model T, but it is full scale and not a prototype. That is what we normally think of when you say pilot.

It is just the first of its kind.

[1662] Q To put it this way, is Dresden 2 the first commercial size nuclear plant of the Commonwealth Edison Company?

A No, that is not right either, because when we ordered Dresden 1 in 1955, a 200,000 kilowatt unit was a commercial-sized unit.

I will put it this way. It is the first unit that we have ordered where the costs were competitive with coal.

Q Is Dresden 1, sir, producing power as cheaply as comparable-sized coal-fired plants?

A The answer is yes, after writing off $15 million of research and development costs which we were allowed by the Internal Revenue Service to write off. These were costs contributed by ourselves and some six or seven other members of the nuclear power group.

We obtained a ruling in 1955 for permission to write off these estimated excess costs and with these costs written off the over-all cost of generation at Dresden 1 is competitive with the cost of generation from similar-sized coal-fired plants of the same vintage, or, I should say,

which were in operation at the time Dresden 1 was ordered in 1955.

This was our benchmark, and it met the [1663] benchmark.

Q You have had some delay in Dresden 2, have you not?

A Yes.

Q Approximately how long has the delay been?

A Approximately a year. We expected it to be in commercial operation originally by the spring of 1969, and I guess, hopefully, it will be in commercial operation in the spring of 1970.

Q This delay has resulted in added expenses to General Electric, is that correct? It was a turnkey contract, wasn't it?

A It certainly was, but it has resulted in added expenses to Commonwealth Edison, too.

Q Approximately how much?

A I don't know, but if we measure it in terms of increased fuel costs it is pretty sizeable.

It is certainly measured in the millions of dollars.

Q Have there been some delays at Quad-Cities, too?

A Yes, all the nuclear units, all the first four units are delayed approximately a year. Excuse me; that is overstating it a bit, but between six months and a year due to a very well-known failure of Babcock & Wilcox [1664] to meet its schedules in fabricating reactor vessels in its Mt. Vernon Plant and this has been taken care of with respect to the Zion units by our purchase of an extra reactor vessel.

Q Sir, did Commonwealth Edison Company invite bids for coal-fired equipment in conjunction with its recent invitation for nuclear bids?

A No, because we were already building Powertown 5, and we were able to extrapolate very accurately, I think, what the cost of Powertown 6 would be.

The turbine prices are pretty well a matter of public knowledge, and the other components we are pretty well aware of what the prices are, and when we, as we have to do in a coal-fired station, do all the construction work ourselves, we have had a great deal of experience and

we are able to estimate these costs and have done so in great detail.

Q Sir, in your direct examination you testified that the cost per kilowatt hour at Powertown 5 was 215 a kilowatt hour. Would the increased cost be based on the acceleration, construction acceleration schedule there and also—would it be based on that?

A You misinterpreted my direct examination. I testified that Powertown 5's budget was $215 a kilowatt.

[1665] Q Yes, sir.

A Not per kilowatt hour.

Q Per kilowatt; excuse me.

A This is construction costs. Now, let's take it from there. What is the question?

Q Would that cost of $215 be accounted for partially because of the accelerated construction schedule at that plant?

A Very little of it, perhaps maybe $10, something like that, but it is not an important part of the cost.

Q Would this $215 cost be particularly ascribed to the work being done for possible Powerton 6 at that station?

[1666] A Yes, I think again we are talking something on the order of $10 for that figure. I don't have it precisely in mind.

It is in the record in our rate proceeding before the Commerce Commission, but I think it is about $10.

Q On direct examination, sir, Mr. Hedlund asked you regarding the coal contract for the Powerton station, and you testified this was with the Carter Coal Company, a subsidiary of Humble Oil & Refining Company.

It is a fact, is it not, that Humble is developing an underground mine in Macoupin County, Illinois, to supply coal for that generating station, is that correct, sir?

A I think so. I don't remember the county.

Q Do you have confidence that Carter Coal Company will make deliveries on that contract?

A Yes.

Q From that mine?

A Well, I have confidence that they will make deliveries. That is all that is of importance to me.

MR. CUSACK: May I confer with my colleagues, your Honor?

THE COURT: You may.

[1667] (There was a short interruption, after which the following further proceedings were had herein, to-wit:)

MR. CUSACK: Just two more questions, your Honor, if I may, please.

THE COURT: You may.

BY MR. CUSACK:

Q In reference to the coal reserve being acquired by Comonwealth Edison through PIAMCO, these reserves are located in Illinois, are they not?

A Yes.

Q Are they located in central Illinois?

A Some place in central Illinois. I am not precisely sure.

Q Would it refresh your recollection if I stated they were located near the town of Petersburg?

A You did a while ago, and I said I wasn't sure.

Q Is it a fact, sir, these are strip coal reserves?

MR. HEDLUND: I object to that, your Honor, on the same basis as before, that is, going into the minutia of these coal reserves. We have already established they are reserves and my objection is renewed.

THE COURT: Objection overruled. He may answer.

[1668] BY THE WITNESS:

A Well, we have no specific plans for mining coal. We do hope it will be strip.

BY MR. CUSACK:

Q Mr. Corey, who in your company would have the information as to the amount of reserves you are attempting to acquire in Illinois, coal reserves?

A Mr. Beeman.

Q Would Mr. Snyder also have this information?

A Yes.

MR. CUSACK: We have no further questions. Thank you very much, your Honor.

THE COURT: Any redirect?

MR. HEDLUND: Yes, your Honor, I will have redirect. I am mindful of the witness' convenience. If he would be agreeable to returning tomorrow, I would like to take him on redirect at that time.

THE WITNESS: I have made arrangements to—Mr. Ayres won't leave until 4:00 o'clock.

MR. HEDLUND: Then would you be willing to stay, your Honor?

THE COURT: Yes.

MR. HEDLUND: Could I have, then, about five minutes, your Honor?

* * * *

[1670] REDIRECT EXAMINATION

BY MR. HEDLUND:

Q Mr. Corey, I believe you testified on cross examination with respect to regulations on air pollution in the City of Chicago, and you mentioned that those were not the only regulations that were looming on the horizon, or something like that.

What other regulations were you referring to?

A The State of Illinois has some proposed regulations applicable to the Chicago metropolitan area.

Q Is that in connection with the Federal Clean Air Act of 1967 in the so-called Greater Chicago Interstate Quality Control Region?

A I think so.

Q Do you know what areas or what counties are included within at least the Illinois portion of that?

A I believe it is the area that is generally defined as the Chicago metropolitan area, which is, if my recollection is correct, Lake County, Cook County, DuPage County, Will County and possibly parts of McHenry County, though I am not sure. I am not sure whether it includes Kane County. I think it does.

[1671] THE COURT: You do not follow the Chicago Tribune's definition which carries it into Milwaukee, Iowa—

THE WITNESS: We stop short of the Twin Cities anyway.

BY MR. HEDLUND:

Q With respect to the question Mr. Cusack asked you as to who the principal competitors are at your coal-fired stations, directing your attention to the Ridgeland Station and its operation in the next year, who are the principal competitors for that station?

A The oil companies. The oil companies with international oil.

Q Isn't it true too, Mr. Corey, that that oil is going to cost you from a BTU delivered standpoint more than your coal cost in prior years?

A Yes.

Q Nevertheless, that is going to oil, is it not?

A Yes.

[1672] Q So it is fair to say that just taking the Ridgeland station, the delivered cost of energy per BTU is not the sole or indeed even the most significant factor in the competition between coal and, in this case, oil?

A That's right.

Q Is it not also correct, Mr. Corey, that as a result—let me back away from that for a moment. In the past you have burned a considerable amount of natural gas at Ridgeland, have you?

A Yes.

Q As a result of switching Ridgeland from coal to oil, you will be able to use this gas at other stations, will you not?

A Yes.

Q Will you use that gas at other coal-fired stations?

A Yes.

Q So that to that extent the gas will displace coal at these other coal-fired stations, will it not?

A Yes.

* * * *

[1678] RECROSS EXAMINATION

BY MR. CUSACK:

Q Mr. Corey, Commonwealth Edison Company does purchase some fuel on the basis of the lowest price per delivered BTU, does it not?

A Well, in the last six months, I would say our coal purchasing—the most important consideration in our coal purchasing has been the sulphur content. Once we get enough low sulphur coal to meet our needs, low sulphur coal that we can burn to meet our needs, that is, we certainly hope we will find our selves in a position where we can start picking and choosing and picking that burnable low sulphur coal which is cheapest. But at the moment, we are in the rather desperate situation of buying just about all the burnable low sulphur coal we can get.

Until we can assure the public and the Government that we are going to meet all of the requirements and meet all of our promises, we would just be buying whatever we could lay our hands on almost.

I hate to put it that way, because we obviously do consider price and have to, and that is what you are getting at, I am sure. I am not trying to quibble with you, but—

[1679] Q Well, in reference to GX Nugent Deposition 38, directing your attention to the mines in the Southern Illinois freight rate district, Commonwealth Edison Company does at the present time purchase coal produced in this district, is that correct, sir?

A I am not sure. Would you outline that district to me?

Q Yes. (Indicating)

A I don't know of any for sure. I should qualify an answer I gave to Mr. Hedlund, that I know we are buying some coal through O'Keefe and it is coming from various mines, and I don't know where the mines are. I think maybe some of them are in West Kentucky and some are in that district. I don't know. I am sure there are others here who do know. I don't.

Q In reference to the Kincaid station of the Commonwealth Edison Company, which is located contiguous to the Mine No. 10 of Peabody, are you at the present time burning high sulphur coal at that station?

A Yes.

Q And you do have stack precipitators on that station, do you not, which eliminate approximately 98 percent of the emission from those stacks?

A Yes. We have precipitators on virtually [1680] every, high efficiency precipitators on virtually every stack in our system.

Q In reference to the Powertown station, at Pekin, Illinois, you are burning high sulphur coal at that station, are you not?

A Yes.

Q And the new unit that is being built there at the Powerton 5 will consume high sulphur coal, is that correct, sir?

A That is correct. Assuming that we are able to develop an effective sulphur removal process by the time that unit goes in service or shortly thereafter.

Q And you do expect to develop that, do you not, sir?

A They are working very hard on it, yes.

* * * *

[1685] MR. CUSACK: Your Honor, at this time the Government moves the admission into evidence of GX-135, the petition before the Illinois Commerce Commission of the Commonwealth Edison Company.

THE COURT: Any objection?

MR. HEDLUND: No objection.

THE COURT: It may be admitted.

(The said document was received into evidence as Government Exhibit 135.)

MR. HEDLUND: I have just two quick questions.

THE COURT: All right.

REDIRECT EXAMINATION

BY MR. HEDLUND:

Q Just so the record is clear, electrostatic precipitators which you referred to in your cross examination by Mr. Cusack do nothing with respect to sulphur emissions or sulphur dioxide, do they?

A That's correct.

Q They are confined solely to particulates or what is known as fly ash?

A Yes, sir.

Q You mentioned your demonstration or pilot installation of a sulphur dioxide control device. That will not be completed for operation until the end of next [1686] year, is that correct?

A I think that is right. We will complete it as fast as we can. But we do not expect it to be more than a demonstration facility. We are still working. This is research and development in its present stage.

Q But as I understand it your target date for installation at this present time is about 18 months from now.

A That's right.

Q Is it not also a fact that right now you have no equipment installed on any of your generating stations to reduce or control the emission of sulphur dioxide?

A That's right. We have been experimenting with the addition of additives to the furnace so that the low sulphur coal we burn will not result in improper operation of the precipitators and will not result in increased dust emissions from the precipitators by reason of having not enough sulphur dioxide to cause proper ionization of the stack gases. So in that sense we are taking the steps necessary to make it possible to burn low sulphur coal without increased particulate emissions which might result otherwise.

Q By low sulphur coal, this would be with a sulphur content less than 2.5 percent?

A Less than 1 percent.

* * * *

[1693] JOHN D. AMES,

called as a witness by the defendants herein, having been first duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. HEDLUND:

Q Would you please, for the record, state your name and occupation.

A John D. Ames.

THE COURT: Spell your last name.
THE WITNESS: A-m-e-s.

BY THE WITNESS:

A I am a partner in the investment banking firm of Bacon, Whipple & Company, 135 South LaSalle Street.

BY MR. HEDLUND:

Q Mr. Ames, if you will, try to keep your voice up. That is not a microphone; that is simply a device for a tape recorder.

A I will; I am sorry.

Q Mr. Ames, could you please give me a brief description of your educational and business background.

A I went to preparatory school in Asheville, North Carolina, and to Princeton University where I [1694] graduated in 1928.

From 1929 to 1952 I was publisher of the Chicago Journal of Commerce. At that time we sold the Chicago Journal of Commerce to the Wall Street Journal.

I then became a general partner of Bacon, Whipple in, I think, 1952 or 1953 and have been there ever since.

Q Would you give us the names, sir, of some of the boards of which you have been a director in the last 15 or 20 years.

A Well, of course, there is United Electric Coal. Up to last year I was a director of the Wallace Murray Corporation. I am presently a director of the Pyle National Company here in Chicago, of the Homeowners Insurance Company here in Chicago, and the Clark Equipment Company of Buchanan, Michigan.

Q When did you first become a director of United Electric?

A In 1948, I believe, 1948 or 1949; I am not sure which.

Q And for how long did you serve as a director for United Electric?

A Until 1966.

Q Approximately or almost—

[1695] A 17 years.

Q When you became a director for the first time, who was president of United Electric?

A Mr. Frank Kolbe.

[1696] Q And he continued as a director, did he, I mean as president until 1959, is that correct?

A That is correct, yes, sir.

Q And who was president after 1959?

A John Morris.

Q While you were a director, I mean.

A Yes.

Q Do you recall back in 1955 whether or not the company, that is United Electric, was involved in merger discussions with any other company?

A I believe there was some talk at that time about a merger with Truax-Traer.

Q Do you know why at that time United Electric had entered into such negotiations or such discussions?

A I believe it was generally thought by the management and the board that a merger of some kind would be helpful to United Electric to gain additional reserves.

Q Do you recall in 1959 when representatives of Material Service and Freeman came on the board of United Electric, do you?

A I remember.

Q Can you tell me at that time and following whether there was any discussion by you with others [1697] in the company or any general discussion at which you were present where the subject of the possible merger between Freeman and United Electric took place?

A I don't remember any discussion except a very short conversation I had with Mr. Reuben Thorson.

Q We have heard of that discussion before. Can you tell me what you recall of that discussion?

A Mr. Thorson and I were walking back from a meeting, and he said that he thought it would be in the best interests of United Electric Coal if they merged with Freeman.

THE COURT: About when was this conversation?

THE WITNESS: In 1960. That is a little bit of a guess. I can't tell whether it was the end of 1959, 1960 or early 1961.

BY MR. HEDLUND:

Q Mr. Ames, do you recall whether or not prior to 1959, that is, prior to the Material Service, Freeman people coming on the board, whether there were any discussions at board meetings or any discussions that you might have had with management that indicated any interest by United Electric in becoming a deep miner?

A No, I had no such conversation. I believe United Electric had an experience with deep mining in [1698] western Kentucky that didn't turn out very well, and I don't think the management at the time to which you refer was really interested in deep mining.

Q What about after 1959; do you recall any discussions at the meetings of the board of United Electric or in your discussion with management, whether the subject of deep mining by United Electric ever came up?

A It did come up, and I think the reason it was given consideration was on account of the—how shall I say—talent for deep mining that the men of Freeman Coal had that were also members of the United Electric board.

Q Would you give me your best recollection, Mr. Ames, as to what the company was doing or what efforts United Electric were trying to make with respect to acquiring additional reserves after Mr. Nugent came on the board of United Electric and became chairman of its executive committee?

A Well, I think that one of the things that was uppermost in everybody's mind at that time, including Mr. Nugent's, was the fact that United Electric should somehow or other obtain some more reserves; and the matter was discussed, and I don't know how to say it, [1699] but I think regularly or at regular intervals.

Q Did you have enough contact with the company to form an opinion as to whether the reserve activity of United Electric was greater or lesser or about the same after Mr. Nugent came on the board than before?

A I think I would have to say it was greater.

[1700] Q Mr. Ames, the Government is contending in this case or has contended that following the election to

the board of United Electric of the representatives of Material Service and Freeman, these directors hampered and held back United Electric in acquiring additional coal reserves.

Mr. Ames, I ask you in your opinion is there any substance to such a charge?

A There is none.

Q From 1959, that is again upon the election of the Material Service-Freeman representatives, were you aware of any attempt or desire on the part of Mr. Nugent and the other Material Service-Freeman-General Dynamics directors to unnecessarily conserve United Electric cash or to hold back United Electric in any way from making needed capital improvements or for improving the financial basis, the equipment basis of the company?

A If I recall correctly, there was a great deal of money spent for capital improvements—I can think of two wheels, and I can't name much more—than there was in the previous five or six years, and I think I would have to answer that question that there was no indication that I could see that these directors were in any way trying to prevent capital expenditures or [1701] to hold back the growth of the United Electric Coal Company.

Q Mr. Ames, you served as a director up until 1966, that is up until the tender offer for the balance of the shares of stock, did you not?

A Yes.

Q Between 1959 and going up until that time, did you ever see any evidence or have any suspicion that the Freeman-Material Service or General Dynamics directors were trying to run United Electric for the benefit, not of all the stockholders, but for the benefit of Freeman-Material Service or General Dynamics?

A I didn't see any, and I think I would have been pretty upset if I had seen some.

Q Are you absolutely sure that you saw none?

A Yes, I am absolutely sure.

Q Going back to 1959, Mr. Ames, do you know whether or not Mr. Kolbe was in favor or opposed to the re-

structuring of the board that took place, that took place in that year?

A Can I give an opinion?

Q If you will also indicate the basis for that, yes.

MR. CUSACK: The Government objects, your Honor. [1702] Opinion evidence is not proper in response to that question.

THE WITNESS: I was wondering.

THE COURT: The way the question is framed, the objection is sustained.

BY MR. HEDLUND:

Q Mr. Ames, do you know of your personal knowledge whether Mr. Kolbe was opposed or in favor of the restructuring of the board in 1959?

A I would have to answer no.

Q Mr. Ames, would you give me your opinion, please, as to the competency and ability as a coal executive of Mr. Frank Nugent?

A Well, I thought he was excellent.

MR. HEDLUND: I have nothing further, your Honor.

THE COURT: You may cross examine.

CROSS EXAMINATION

BY MR. CUSACK:

Q Mr. Ames, is it a fact that from 1959 to 1966 when United Electric was merged into General Dynamics that United Electric made substantial progress?

In order for you to answer this question, I hand you what is in evidence as GX Nugent Deposition Exhibit 31 at pages 12 and 13.

• • • •

[1707] Q To refresh your recollection, sir, do you recall United Electric acquiring coal reserves at the Round Prairie Field?

A Yes, I do.

Q Isn't it a fact, sir, that while you were a director of United Electric, United Electric did acquire a substantial amount of coal reserves at the Round Prairie Field?

A I don't know. I don't know the number or how much.

Q Sir, based on your testimony on direct examination in regard to whether or not the General Dynamics directors on the board of United Electric were using United Electric for its own purposes, I ask you whether or not it was the intention of the board of directors of United Electric while you served to the board to turn over to Freeman Coal the corporate opportunity of mining the Round Prairie underground coal reserves?

A No.

Q Isn't it a fact, sir, that you were on the board of United Electric there were plans for United Electric to develop in the future its underground coal [1708] reserves?

A With the help of Freeman.

Q And Freeman would be compensated, would it not?

A This was my understanding.

Q And United Electric also could, could it not, have developed its underground reserves with the help of another underground company, could it not?

A I don't see that that would have been as good as doing it with Freeman.

Q Would it have been as good had United Electric acquired underground personnel to acquire the reserves without Freeman?

A That wasn't necesary. Freeman was there.

Q If Freeman had not been there, Mr. Ames, do you believe it would have been likely that United Electric on its own would have developed its underground coal reserves?

A I do not.

Q On what do you base your opinion, sir?

A Well, Mr. Kolbe, and even Johnny Morris—they had no leaning toward underground coal. They didn't know very much about it. As I said before, they had one bad experience, and I saw no indication or would have

no idea that without Freeman they would have gone independently by themselves.

[1709] Q Is it a fact, sir, that Mr. Kolbe felt that the future of strip mining was bright and that it would not be necessary for United Electric to go into underground coal?

A I think, if there were plenty of reserves, that future for strip mining would have been good, but there weren't plenty of reserves.

Q On what do you base this opinion, sir?

A Well, the numbers I think speak for themselves.

Q Did you ever investigate yourself the availability of strip coal reserves in Illinois?

A The only information I got was information given to me at directors meetings by Mr. Kolbe and subsequently by Johnny Morris and Frank Nugent.

Q Did Mr. Kolbe ever indicate to you that in his opinion United Electric would not be able to buy sufficient strip coal reserves to remain in business?

A He never went that far, but there weren't any strip coal reserves left. They were all gone.

Q Who stated that to you?

A Well, somebody on the board. Some of the management.

Q Did Mr. Nugent state that to you?

[1710] A I can't remember. I know every effort was made to get them at all times, first by Mr. Kolbe and then more intensely by Mr. Nugent.

Q Do you recall a meeting of the board of directors of United Electric where the board stated that the management could only buy strip coal reserves at the Industry Field at farm prices?

A Yes, I do.

Q Wasn't this proposed by Mr. Nugent?

A No, it was Mr. Kolbe, I think. He would be willing to do that, he said, if he didn't have to pay more than farm prices. The record will so show, I think. I could be wrong on it, but that is my recollection.

Q You voted, did you not, sir, for the acquisition by United Electric of strip coal reserves at the Industry Field, is that correct?

A Well, the record is there. I can't remember.

Q Mr. Ames, prior to your testifying today, did you read testimony in this trial of Mr. Thorson?

A Yes.

Q Who gave you that testimony?

A Defense counsel.

Q Mr. Hedlund?

A Yes.

• • • •

[1715] Q Mr. Frank Kolbe serves on the board of directors of the Clark Equipment Company at the present time with you, is that right?

A That's correct.

Q And Mr. Kolbe is on the executive committee of Clark?

A That's correct.

Q And you served together in that board?

A Yes.

Q In regard to the Truax-Traer merger, isn't it a fact that the primary motivation for the merger of Truax with United Electric in 1955 was that their mines were very close together, both in Fulton-Peoria and in Perry County near the Fidelity Mine, and that a merger of these two companies would create great operating savings?

A That was discussed.

Q Wasn't this the prime reason for that merger discussion?

A Well, I wasn't in on any of it. All we heard were results or progress or lack of it. I can't tell you the reasoning behind it, except that it would, as I stated once before, increase the total reserves of the combined companies.

[1717]

IN THE UNITED STATES DISTRICT COURT
NORTHERN DISTRICT OF ILLINOIS
EASTERN DIVISION

No. 67 C 1632

UNITED STATES OF AMERICA, PLAINTIFF

vs.

GENERAL DYNAMICS CORPORATION; THE UNITED ELECTRIC COAL COMPANIES; and FREEMAN COAL MINING CORPORATION, DEFENDANTS

Before HON. EDWIN A. ROBSON, Judge,

Wednesday, April 15, 1970,

10:50 o'clock a.m.

PRESENT:

MR. JOHN THOMAS CUSACK,
MR. ROBERT L. EISEN,
MR. RONALD L. FUTTERMAN,
MR. HUGO SIMS, and
MR. RICHARD J. BRAUN,

appeared for Plaintiff;

MR. REUBEN L. HEDLUND,
MR. DONALD G. KEMPF, JR., and
MR. RICHARD H. IRVING, III,

appeared for Defendants.

ALSO PRESENT:

MR. JAMES M. FOLSOM
DR. PETER STEINER,

• • • •

[1723] DARIC N. MILLER,

called as a witness by the Government in rebuttal, having been first duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. FUTTERMAN:

Q Would you please state your name and spell your first name, please.
A Daric Miller; D-a-r-i-c.
Q What is your business address, Mr. Miller?
A 818 Kansas Avenue in Topeka, Kansas.
Q By whom are you employed?
A Kansas Power & Light Company.
Q What is your occupation?
A I am manager of electric production.

• • •

[1726] Q How many tons of coal did Kansas Power & Light [1727] Company consume in 1969?
A Something like about 140,000 tons.
Q How would you characterize this coal in terms of its sulphur content?
A This is southeast Kansas bituminous which is, generally speaking, in the three and a quarter, three and a half percent sulphur area.
Q What other forms of energy besides eelctricity does Kansas Power & Light Company distribute?
A We are in the transmission as well as the distribution business of natural gas.
Q Does Kansas Power & Light Company have any base load generating stations under construction at the present time?
A Yes. We are in the process of building a unit of about 430,000 kilowatt capacity as an addition to the Lawrence power plant.
Q When will this plant be on line?
A The spring of 1971.
Q When this plant is completed, what percentage of your total generating capacity will it represent?

A It is about 30 percent.

* * * *

[1729] Q Why did Kansas Power & Light Company not [1730] choose oil as the sole energy source for the new Lawrence unit?

A We haven't been able to find that much oil in the state of Kansas that we can buy at a respectable price level.

Q When you decided to burn coal as one of the primary fuel sources at the new Lawrence station, were you concerned at all about stack emissions?

A Yes.

Q Which emissions were you concerned about?

A Well, we were initially, obviously, concerned about particulate emission.

In reading the trade journals and keeping our ears open and our eyes open, we were of the opinion that if something could be had for control of SO_2, it might be time to spend money and have the money well spent.

Q Was there any state or local legislation governing air quality or limiting stack emissions at the time the decision to burn coal was finalized?

A No, I don't think so.

Q Was any contemplated by the State of Kansas?

A Yes. The State was involved in setting up an air quality conservation law that looked like it was going to set forth standards to become effective some- [1731] time about the first of 1971.

Q What types of air pollution control systems, if any, were originally scheduled to be part of this facility?

A We initially laid the plant out with electrostatic collectors and a respectably tall concrete stack.

[1732] Q How much of a capital investment would a system incorporating electrostatic precipitators and a tail stack have required had it been installed?

A The system to include the ponds and the dust and the ash-handling facility in our economic study at about that time was in the area of about $3 million.

Q What kind of an air pollution control system, if any, will this facility contain when it is completed?

A It will have a Combustion Engineering air pollution

control system on it that has the ability to collect particulate as well as SO_2.

Q Why did you choose this system?

A In our examination at that time, it was really the only system that we could find that could do or was proposed that could do anything other than just remove particulate.

Q What is the system designed to accomplish?

A Its guaranteed accomplishments are 99 percent removal of the particulate and 83 percent of the SO_2 in in the flue gas in burning our southeast Kansas coal, which is something in the area of 12 percent ash and 3½ to 3¼ percent sulphur.

Q Did Kansas Power & Light Company install the Combustion Engineering air pollution control system on any [1733] of its other coal-burning units at Lawrence?

A Yes. We have an installation on an existing 125,000 kilowatt unit that we added it to.

Q How much of a capital investment did the stack emission system incorporating the Combustion Engineering air pollution control system require for the new unit at Lawrence?

A In trying to separate out the dollars between the two systems, at the time we made this purchase, we looked in the area of $3 million.

Q Were you able to use any of your existing equipment at the Lawrence Station in the Combustion Engineering air pollution control system?

A Is this question in terms of the new unit?

Q Yes, sir.

A Of course, we already had the ground at the site of which we utilized some of the ground area. The major items of equipment that we did use, we permanently borrowed two coal pulverizers and their appurtanence equipment, which includes the bunkers so that we could grind the limestone in those two pulverizers and inject it into the steam generator in the new unit. Had we not had them, we would have had to bought along with this combustion system some limestone grinding capacity.

[1734] Q How much would that have cost you if you had to purchase that equipment?

A I would suspect something in the area of perhaps $400,000.

MR. HEDLUND: I am sorry, your Honor.

THE WITNESS: $400,000.

THE COURT: That is not an amplifier.

THE WITNESS: Excuse me.

THE COURT: It is for a tape recorder.

BY THE WITNESS:

A I would suspect in the area of $400,000.

BY MR. FUTTERMAN:

Q Could you very generally describe the mechanics of the Combustion Engineering air pollution control system?

A We are pulverizing limestone and blowing that limestone into the furnace to calcine the limestone to a reactive material, an alkaline reactive material, so that we can collect and precipitate and collect the SO_2 in the scrubber and dispose of it in the pond.

[1735] BY MR. FUTTERMAN:

Q Prior to the Kansas Power & Light Company's commitment to purchase stack emission control devices, did you conduct any tests of the Combustion Engineering system?

A We did run some tests on the 125,000 kilowatt unit there at the station.

Q Where and how did you conduct tests?

A Our main process of conducting the tests was to determine if we could put limestone in the furnace with the fuel and end up with the exit pass from the boiler, with the limestone in a reactive state that when the scrubbers were added, it was there available to be used for SO_2 removal.

Q What did Kansas Power & Light Company conclude after conducting these tests?

A Well, after we finished those tests and we evaluated our economics and looked at what we had available for stack emission control, we decided to purchase the Combustion Engineering air pollution control system for that 430,000 unit.

We also decided to purchase a like system for the existing 125,000 kilowatt unit, the particular purpose being that the Lawrence station now was going [1736] to become a major coal-burning plant on our system, to provide stack emission control on the 125,000 kilowatt unit, and also to learn how to operate, and what the bugs were, and what the problems were in this Combustion Engineering system, so that by the time we came to the 1971 start-up date on the 430,000 unit, we could assure ourselves that we had a system that, in our opinion, would be reliable to operate at that time.

Q Is the 125,000 megawatt unit containing the Combustion Engineering system in service at the present time?

A Yes.

Q When did it go into service with the Combustion Engineering system?

A The unit initially went into service in the Spring of 1968. We put the air pollution control system in service on the unit in December of 1968.

Q Have you encountered any insurmountable problems with the 125,000 megawatt unit, to the present time?

A We encountered problems from the day we started it up. Up to this juncture, I don't think that we have encountered any insurmountable problems. [1737] We have labored rather seriously with the system in an effort to find out how it works, and have modified the system somewhat. We have changed some of the materials that were initially installed in the system to where we can install the scrubber system on the new unit with those modifications as originally planned.

Q Do you believe that you have had sufficient operating experience with your Combustion Engineering air pollution control system at Lawrence to expect reliable operation with the same system on the 430,000 megawatt plant?

A From what our experience has been, yes, we do expect to have reliable operation out of the 430 unit when it goes on the line next spring.

Q At the time Kansas Power & Light Company decided to purchase the Combustion Engineering air pollu-

tion control system, to your knowledge was there any other sulphur dioxide emission control system available for sale?

A We are not aware of any that were available at that time.

[1738] BY MR. FUTTERMAN:

Q To your knowledge at the present time are other manufacturing companies engaged in the technology of stack gas emission control?

A From what we read in the trade journals and listen, yes, I'm sure there are.

Q Are you as familiar, less familiar, or more familiar with other stack gas emission control systems as you are with your Combustion Engineering air pollution control system?

A We feel like we have a rather serious familiarity with the Combustion Engineering air pollution control system, but we are not familiar with the others.

MR. HEDLUND: I'm sorry, I did not hear that answer.

THE COURT: Read the answer.

A (Read by the Reporter.)

BY MR. FUTTERMAN:

Q Has your Combustion Engineering air pollution control system performed in accordance with its guarantees?

BY THE WITNESS:

A We have made the guarantee performance from the unit, yes.

Q Have members of the trade expressed any interest in your Combustion Engineering air pollution control system?

[1739] A We have had a lot of visitors and a lot of people talk to us on the phone concerning the subject, yes.

Q What will be the sulphur content of the coal burned at the Lawrence, new Lawrence unit?

A It is contemplated, in that it is coming out of the same mine as to what we are burning coal now, that we

are in the three and a quarter, three and a half percent sulphur area.

Q Subsequent to the operation of the 430 megawatt plant at Lawrence in April 1971, when will your next base load expansion occur?

A Our present plans as far as base load addition look like about spring of 1978.

Q How large a plant are you contemplating at the present time?

A We haven't tied down the size, but we would expect it will be at least as large as the 430,000.

Q What fuel or fuels do you expect will be consumed in this plant?

A Well, again in looking at it with our pencil it doesn't look like nuclear is economic at that size range, so we expect that we will have a choice between gas and coal, as far as primary fuel.

[1740] Q Do you anticipate that coal will be burned at the plants to come on line in 1978?

A I would expect that coal will be the major fuel that is burned in that plant in 1978.

Q Are you installing a stack gas emission control system on that plant?

A I think, in looking at the regulations we are obliged to operate under, we will, if we burn coal, be obliged to control stack emissions.

It would appear that we may even have a choice as to what kind of a system we do it with.

Q Do you believe that the Combustion Engineering air pollution control system which is being installed on the 430 megawatt plant will do the job that is designed to do?

A From our operating experiences on the 125,000 kilowatt unit, I don't really think there is any question but what it can perform.

• • • •

CROSS EXAMINATION

[1769] BY MR. HEDLUND:

• • • •

Q And about how high?

A It extends upward something, it looks like about 100 or 120 feet.

Q Something similar to, say, a 10 or 12-storey building?

A Yes, a rather small one.

Q Would you give me, sir, your best opinion—let me approach it this way.

If we take the figure of $3.5 million that you have testified to as to the end cost of your two units plus the $400,000 that you were able to save, or the reproduction costs of the pulverizers, you get to $3,900,000, what would be the approximate kilowatt cost then, the capital kilowatt cost for these two units?

A Well, we are looking at a net output between the two of them of something like 550,000 kilowatts. If we add the $400,000 worth of equipment that we did not have to spend money for, we end up with a number then that looks like about $7 a kilowatt.

Q $7 per kilowatt?

A Yes.

Q In your opinion, does that represent, if one were to construct such a device today, does that $7 per kilowatt represent what you believe it would cost today [1770] on a kilowatt basis?

A May I interpret that question to mean if we were repurchasing this today for our system, what could we buy it for?

Q That is correct, and without regard to savings that you would be able to make because of prior acquired equipment or land for that.

A Yes, and knowing full well that we have some modifications that we would then have to be buying today that we did not have at the time of our purchase.

Q Right.

A I don't know the answer to that question. I will give you an opinion of what I think the magnitude of that number might be.

Q Yes, sir.

A I would guess something in the area of $8, $8.50, today.

Q That is $8 to $8.50?

A Today.

Q Today, per kilowatt?

A Yes.

Q Would you give me, sir, your best estimate of what your owning and operating costs per ton of coal will be with respect to the continued operation of these [1771] two units?

A In our normal manner of looking at that question, we do not include owning cost as an operating cost. We are expecting, and from what we have demonstrated, we would look at an operating cost of somewhere between a cent and a half and two cents per million BTU. Our coal is essentially 25 million BTU. So, you can equate that on a ton of coal basis for me.

Q In your judgment, would an estimate of Combustion Engineering's system's owning and operating costs at approximately 90 cents a ton, applied to coal similar to which you are purchasing, be a reasonable estimate? I am including there both owning and operating costs.

A We are talking about 90 cents a ton, we are talking about essentially our coal?

Q That is right.

A As far as its BTU content?

Q That is correct.

A We are talking about limestone and we are talking about power and we are talking now about fixed charges of owning?

Q No. We are talking about both fixed and operating costs, limestone maintenance—

[1772] A Including the limestone at this juncture?

Q Yes.

A I think that the 90 cents a ton is in a reasonable area, correct, yes.

• • • •

[1778] Q You are aware, are you not, that Combustion Engineering has a similar limestone wet scrubbing system [1779] installed at the Meramec plant of Union Electric?

A Yes, sir.

Q Have you visited that operation?

A I visited it before it went in service.

Q Pardon me?

A I visited it before it went in service.

Q Have you visited it subsequently?

A No, sir.

Q Have you had any conversations subsequently with anyone from either Combustion Engineering or Union Electric with regard to that system?

A Oh, about third-hand basis.

Q You do know, do you not, that they have had substantial operating problems with respect to that?

A I have heard they have.

Q You are aware, are you not, Mr. Miller, that a spokesman for Combustion Engineering, in reference to the unit at Union Electric, stated in the summer, I believe it was, of 1969, that "At the present time the process is not a commercially acceptable unit"?

A We are talking about the one at St. Louis?

Q That's correct.

A I haven't tried to read all the material on the St. Louis one.

[1780] Are you aware that such a statement was made by Combustion Engineering?

A I have, again, second- and third-hand information of that statement, too.

Q Mr. Miller, is it fair to conclude on the basis of the decisions made by Kansas Power & Light with respect to the installation of these devices, and with respect to the operating experience that you have had, that sulphur removal devices are now commercially available, commercially operable for all, or even most of the utility stations in this country?

A Let me attempt to answer your question in this manner:

I think a sulphur removal device, as we understand ours, which is really the only one we can talk about, is a system you have to engineer and design to a specific environment of plant.

Beyond that, I don't know that I know the answer to your question, because I don't know the environment that you are talking about putting them in in a specific enough nature to answer that question.

• • • •

[1782] Q At the present time, Mr. Miller, to your knowledge—let me back up, if I may, your Honor. I should be able to do this very shortly.

[1783] In terms of your prediction on operating costs of, I believe you stated, a cent and a half to two cents per million BTU, it is the fact, is it not, that you really don't have a good handle on what your maintenance costs are going to be with respect to the 430—

A As far as long-term maintenance costs, no, we do not have.

Q Other than the Combustion system that has been installed at Union Electric, and has been installed at Kansas Power & Light, and is to be installed on your 430 megawatt station, are you aware of any other installations of such a system in the country, either presently existing, or under construction?

A No, sir.

Q Is it a fact, is it not—before I ask that question, Mr. Miller, could you give me your opinion of what the megawatt size is of an average base load unit being installed today?

I know that is difficult to answer unless you take it on a system by system basis. But, say, for other than such systems as Commonwealth Edison or American Electric—

A Well, I think it is really only fair to say [1784] that I don't know anything about Commonwealth Edison or American Power.

Obviously, the size of installation of a base load unit that I know something about is our own, which is 430,000 kilowatts, which would be those in the reasonably immediate area around us, which are up in size now, as far as installation in service, to 500,000 kilowatts.

* * * *

[1827] FRANK NUGENT,

called as a witness by the defendants herein, having been first duly sworn, was examined and testified as follows:

MR. HEDLUND: As your Honor is aware, Mr. Nugent's deposition was taken for some three or four days.

THE COURT: Yes.

MR. HEDLUND: I do not intend without reason to recross ground covered at that time, nor do I intend to

go into a number of subjects with Mr. Nugent about which he is definitely familiar but which there is already a considerable body of evidence and which I feel would be repetitive.

THE COURT: All right.

DIRECT EXAMINATION

BY MR. HEDLUND:

Q For the record, please, sir, would you state your name and present occupation.

BY THE WITNESS:

A Frank Nugent; Group Vice President of General [1828] Dynamics, President of Freeman Coal Mining and President of United Electric Coal Company.

Q Would you please, sir, for me please briefly describe your background and experience in the coal industry.

A I have been in the coal mining busines for about 50 years starting—

MR. CUSACK: Your Honor, may I object here.

I think it would save time. I asked Mr. Nugent quite extensively in regard to his qualifications. It is in the deposition. I really think it is repetitive. It is in evidence. I think I went into it with a fine-tooth comb. I really don't think it is necessary we all know Mr. Nugent's qualifications.

THE COURT: You agree to his qualifications and background as stated in the deposition?

MR. CUSACK: I certainly do, your Honor.

MR. HEDLUND: I did not mean to go into this with a fine-tooth comb but just to hit the high spots in terms of what he was—

THE COURT: Well, it is in the deposition. Let's proceed from there.

BY MR. HEDLUND:

Q Mr. Nugent, when did you first become affiliated [1829] with Freeman Coal Mining Corporation?

A November—Well, let's see. In November 1921 with the Burton Coal Company, and the Burton Coal Company acquired the Freeman Coal Mining Corporation in August of 1922.

[1830] Q I gather that since 1922 you have been with Freeman Coal Mining Corporation as well as others?

A Yes.

MR. HEDLUND: I do not believe this is in the deposition, your Honor.

BY MR. HEDLUND:

Q Would you please describe your function for General Dynamics in your capacity as group vice president other than your responsibilities directly with respect to United Electric and Freeman Coal Mining Corporation.

A The president of Material Service and the president of Marblehead Lime report to me. I am associated with the Asbestos Corporation in Canada as a member of the board.

Q You became, did you not, president of United Electric upon the retirement of Mr. John Morris?

A Yes, sir.

Q How long did you serve in that capacity?

A Mr. Morris retired in November of 1966. I took over as president to January 1st, 1968.

Mr. Camicia was president from January of 1968 to April 1st of 1969.

I again took over on April 1st, 1969.

Q You have continued to serve in that capacity since?

[1831] A Yes, sir.

Q Mr. Nugent, I hand you what has been received in evidence as Defendant's Exhibit 48, and hand it to you, which is a letter, a printed form letter, dated December 15, 1954, on the letterhead of the Chicago Wilmington & Franklin Coal Company to the stockholders of CW&F Coal Company, and signed by George B. Harrington as president.

Without meaning to characterize the document, but in the interest of time, I note that this is in effect an offer for the tender of shares of the CW&F Coal Company. I note that in the third paragraph, referring to an offer that has been made, it states:

"Understandably the other party to these discussions has not yet wished to be disclosed."

I ask you, if you know, who the other party was to these discussions and, in effect, who is going to acquire the stock for which this offer was being made?

A The Empire Building Corporation. I think that was the proper corporate name.

Q Who owned Empire Building Corporation?

A The Crown family.

Q Did they also at the time own Material Service?

A Yes, sir.

[1832] Q then, in effect, did they also at the time own Freeman?

A Yes, sir.

Q I note that this document is dated December 15, 1954.

Do you know whether or not the stock sought by this offer was, in fact, acquired by Empire Building Corporation or by the Crowns?

A Yes, sir, it was.

Q Do you know when?

A The closing was on December 31st, 1954.

Q At that time, had they acquired all or substantially all of the stock of CW&F?

A Substantially all.

Q In 1954, CW&F owned and operated coal mines, did it?

A Yes, sir.

Q In the state of Illinois?

A Yes, sir.

Q Following the closing, that is, at the end of the year 1954, and on indefinitely into the future through and including 1960 or 1961, were the mines of CW&F, in fact, operated by Freeman and was the coal produced at those mines, in fact, sold by Freeman?

A The mines were operated by Freeman and the coal was sold by Freeman.

[1833] Q There is some evidence in this case—again, without attempting to characterize it— that it was not until 1958 or 1959, or whatever the record does show, that certain of the properties of CW&F were not until

that time actually transferred to Freeman or to any of its affiliates.

Could you explain to me, if you know, why there was that delay?

A There were some tax considerations. But in addition to that, the Orient No. 2 Mine, which had been a large hand-loading mine and at one time one of the largest hand-loading mines in the country, had a bad unemployment experience. Freeman sought not to acquire that unsatisfactory experience. That was the reason for the delay.

Q Is it true in point of fact that from January 1, 1955 forward, other than the qualifications that you have just mentioned, that CW&F and Freeman were, in fact, one coal mining company?

A Yes, sir.

Q Would you tell me briefly, Mr. Nugent, the extent to which you participated in the transactions referred to in Defendants' Exhibit 48?

A I believe I called it to Henry Crown's attention [1834] originally and initiated the negotiations, and I carried forward the negotiations with George Harrington.

Q Is it fair to say that it was your idea that, in effect, Freeman acquire CW&F?

A Yes.

MR. CUSACK: Your Honor, that is in the deposition very clearly. There is no dispute on that matter. Mr. Nugent said it before.

MR.HEDLUND: The Court is aware, your Honor—if I may reply?

THE COURT: Yes.

MR. HEDLUND: The Court is aware that there is a dispute between the parties of substantial sort as to when CW&F was acquired by Freeman.

THE COURT: He may answer. That is not going into it in any great detail.

MR. HEDLUND: I believe he answered, but could we have it read back?

THE COURT: Read the answer.

A (Read by the Reporter.)

BY MR. HEDLUND:

Q Mr. Nugent, when, if you recall, did the Crown interests or Material Services first acquire stock in the United Electric Coal Companies?

[1835] A 1954.

Q Could you briefly describe the circumstances surrounding the initial purchase?

A Well, initially, I think we acquired a small block of stock, really, with no serious intent, perhaps. But as I got to studying the reserve situation, it occurred to me that this would be a worth-while acquisition because of the shortage of reserves and because we did have reserves that would back up that property. I could see that the company was eventually going to go into liquidation.

[1836] Q Following—how soon was it after 1954, if you recall, that your interest changed from one of, I believe you described it as no serious intent, or to one of looking at the situation more closely?

A Well, we bought the first block of stock rather quickly, and I began to think about it just as soon as we acquired the stock.

Q Again, in 1955, could you describe and, say in a period 1955 to 1958 generally, describe what sort of contact you maintained, or what sort of inquiries you would make with respect to the operations and the management of the company of United Electric?

A Well, I had some reservations about the top management, and I watched it very closely on a day-to-day basis, I would say.

Q Do you recall when for the first time you began, if you did, discussions with Johnny Morris concerning underground or deep mining possibilities that had come to the attention of United Electric?

A Well, I don't think I originated those discussions. I thought that Morris brought the deep mine operations to my attention perhaps in the year of 1958, at first.

Did these conversations, did this type of [1837] communication between you and Mr. Morris, or others at United Electric, continue thereafter?

A Yes, sir, it did.

Q If you recall, at Board meetings—let me stop there.

Just for purposes of trying to develop this logically, you went on the Board of United Electric in what year?

A 1959.

Q And you also became Chairman of its Executive Committee at that time?

A Yes, sir.

Q Subsequent to 1959, at both Board meetings—or, at Board meetings or at Executive Committee meetings, was there discussion of deep mining possibilities by United Electric?

A At times, yes.

Q And to what extent would you participate in those?

A Well, I would say that I expressed my views each time a deep mining operation came to the attention of the Board.

Q If I may take a somewhat arbitrary date, but nevertheless, starting with 1958, had you at that time [1838] formed an intention that United Electric and Freeman would ultimately merge?

A Yes, sir.

Q Did Colonel Crown at that time—

A Yes, sir.

Q —or shortly thereafter express a similar intention?

MR. CUSACK: Objection, your Honor. He is asking the state of mind of not only of the witness back in 1958, but of Henry Crown back in 1958.

It is hearsay. It is not proper questioning, and the Government objects and moves to strike his answer in regard to his state of mind in 1958.

THE COURT: Objection sustained.

MR. HEDLUND: Your Honor, I asked if this witness saw any expression of that intent, not as to whether or not Colonel Crown had the intent.

THE COURT: Well, "any expression."

To put it plainly, did he ever make a statement to that effect, or was there any discussion?

BY MR. HEDLUND:

Q Were there any discussions or statements between you and Henry Crown in which Mr. Crown indicated

his intention that there would ultimately be a merger [1839] of Freeman and United Electric?

A I think I can say that I suggested to Henry Crown that there should be a merger; and Henry Crown was in agreement.

MR. CUSACK: Your Honor, the Government objects and moves to strike, unless the witness lays a foundation of where, and when.

THE COURT: Set the dates.

BY MR. HEDLUND:

Q Do you recall when that—do you recall first of all when, if we can describe that as a meeting, when that statement was made, and who was present, and where it was made?

A I don't recall that anyone was present. But the conference took place in Henry Crown's office.

[1840] Q And when would that have been?

A In 1958. And I can't set a month for you.

Q If that was the intention, Mr. Nugent, in 1958, or at least yours, my next question is why did this merger not in fact complete itself in terms of all of the stock of United Electric until 1966?

A About that time—

Q I'm sorry, sir. If you say "about that time," would you indicate which time you are talking about?

A About 1958.

Q Yes, sir?

A About that time, and in the fall of 1958 we started merger discussions with General Dynamics. They failed before the end of the year of 1958. However, we continued to think about the matter, and the merger discussions were again resumed with General Dynamics people in 1959. We were quite busy with General Dynamics, a sizeable merger, and we gave United Electric no thought during that period.

Q What about 1960?

A After 1960, as you may recall, General Dynamics had some problems with commercial airplanes, and again other things were on our mind, and we just didn't get around to it promptly.

Q Did Colonel Crown, to your knowledge—and [1841] for that matter, General Dynamics—continue to purchase stock after 1960 in United Electric?

A Yes, sir, they did.

MR. HEDLUND: Do you have Maguire's Deposition Exhibit No. 1?

MR. CUSACK: Yes, I have one.

MR. HEDLUND: Do you have a copy for the Court?

(Mr. Cusack tendered a copy to the Court.)

MR. HEDLUND: Your Honor, may I interrogate the witness from over here, due to the shortage of copies?

THE COURT: Yes, you may.

MR. CUSACK: May I join you?

THE COURT: You certinly may.

BY MR. HEDLUND:

Q Mr. Nugent, I show you what has been received in evidence as Maguire Deposition Exhibit No. 1, which is a document dated November 24, 1959, to the shareholders of General Dynamics Corporation requesting the shareholder's proxy, proxies to vote in favor of the merger of Material Service Corporation and General Dynamics.

Is this merger to which you have just been testifying?

A Yes, sir.

MR. CUSACK: May I say for the record that this is [1842] a Government exhibit?

THE COURT: You may.

BY MR. HEDLUND:

MR. CUSACK: Thank you, your Honor.

Q You will note in the fifth paragraph of this document it states that: "Despite the long term needs of the nation's various defense programs, considerations of growth and stability dictate that a conservative corporate management actively seek diversification in commercial, non-defense business."

During the negotiations to which you referred, was anything said by representatives of General Dynamics which could lead you to determine whether or not the statement there is accurate, and whether that was a reason

why General Dynamics was interested in merging with Material Service?

A Yes, sir, it is.

Q I note in the second paragraph it states as follows: "The directors expect to achieve this diversification through development of commercial products stemming from present programs such as"—and I would like to take these seriatim.

Number one, the Corporation's Convair 880/600 jet transports.

[1843] What has happened to that program, if you know?

A Both have been discontinued.

[1844] Q It also says, second, Canadair's commercial turbo-prop CL-44 and CL-540 aircraft.

What has happened to these programs?

MR. CUSACK: Your Honor, the Government objects to this line of questioning as being wholly immaterial and irrelevant to the issue of this lawsuit.

This lawsuit concerns the merger of United Electric and the Material Service-General Dynamics, and elimination of competition between Freeman and United Electric.

THE COURT: Do you have any comment?

MR. HEDLUND: Your Honor, there is a raft of evidence offered with respect to General Dynamics by the Government in this case, and I think that this is clearly related to that.

THE COURT: He may answer, subject to the objection.

BY MR. HEDLUND:

Q My question was with respect to the turbo-prop CL-44 and CL-540 aircraft.

BY THE WITNESS:

A The CL-44 was a spring tail turbo-prop freighter, no longer being produced.

I don't recall what happened to the CL-540, but we are no longer making it.

[1845] Q It next refers to General Atomic's nuclear research, maritime and power reactors.

What has become of that program?

A That was a high temperature gas reactor, primarily, and that was sold to Gulf Oil.

Q It next mentions Liquid Carbonics industrial gases.

What has become of that?

A General Dynamics was ordered by the Government to divest itself of Liquid Carbonics.

Q It next refers to Stromberg-Carlson's telephone and high fidelity sound equipment.

What has happened to that, if you know?

A Stromberg-Carlson's telephone business is still quite active. The high fidelity and sound equipment has been discontinued.

MR. CUSACK: Your Honor, I hate to be picayunish, but the Government did not order General Dynamics to divest itself of Liquid Carbonics. It was ordered by the District Court.

I think counsel should stipulate to that.

THE COURT: Was it in an action filed by the Government?

MR. CUSACK: Yes, your Honor, it was. But it is an [1846] order of the Court, not by the Government.

THE COURT: All right, the record may so show.

BY MR. HEDLUND:

Q Mr. Nugent, there is in evidence the fact that at a Board meeting of General Dynamics of May 25, 1961, the following:

> The Chairman stated that the corporation—which is General Dynamics—owned common stock of certain companies as follows: United Electric Coal Company, 250,131 shares; Truax-Traer Coal Company, 32,300 shares; American-Marietta Company, 8,795 shares; and United Utilities Incorporated, 158,400 shares.
>
> He outlined the reasons why it might be advisable to sell part or all of the stock of such companies,

and recommended that authority be granted to take such action.

After discussion, upon duly made, seconded, and unanimously carried motion, it was resolved that the proper officers of the Corporation, with the approval of the Chairman of the Board and Counsel for the Corporation be, and hereby are authorized at such time as they deem it advisable to sell and to take any and all action which may [1847] be necessary in connection with the sale, or part of all of the common stocks of which I have just listed.

Mr. Nugent, do you know why such a subject came up at that meeting, and why such a resolution was passed?

A Well, as a result of the commercial airplane problem at that time the money situation was quite tight, and they were looking for places to acquire some money.

[1848] Q In point of fact, did General Dynamics ever sell any of that 250,103 shares of United Electric?

A Henry Crown was strongly opposed to it and the stock was not sold.

Q Why was he opposed to it, if you know?

A Because he intended to eventually merge United Electric into the Freman Coal Corporation.

Q Would you have been opposed to such a sale?

A Yes, sir?

Q Mr. Nugent, I show you what has been received in evidence as Defendants' Exhibit 9, which is a letter from you, as President of Freeman Coal Mining Corporation, to Mr. Frank F. Kolbe, President of the United Electric Coal Companies, dated February 5, 1959.

My first question is, you were not at that time on the Board of United Electric, were you?

A I think not.

Q My next question is, it refers in the first sentence, "We have your proposed plan for Buffalo Creek."

Was that proposed plan a strip or deep mining?

A It was a plan to go underground, drifting in off the high wall.

MR. HEDLUND: Your Honor, I will be moving into a new area now.

[1849] THE COURT: We will go for another 15 minutes, to make up for some of the time we lost.

BY MR. HEDLUND:

Q Mr. Nugent, I hand you what has been received in evidence as Defendants' Exhibit 23, which is a three-page—I'm sorry. I stand corrected. A five-page document, the first page of which is a memorandum on the memorandum stationery of Irving Crown, bearing a date of 6/16.

Attached to that is a memorandum from JMN to Frank, dated June 11, 1964.

Attached to that is a three-page draft titled "President's letter to shareholders."

My first question is, can you identify the initials on the first memorandum on the stationery of Irving Crown?

A It is Irving Crown's writing, and it is his initials.

Q And does the "Frank" refer to you.

A Yes, sir, it does.

Q Was that memorandum actually prepared on July 16th of 1964?

A Yes, sir, it was.

Q In 1964, what responsibilities, if any, did [1850] Irving Crown have with respect to United Electric?

A He was on the Board of United Electric.

Q Could you, Mr. Nugent, please, decipher the writing, read the writing that appears on the memorandum from Irving Crown.

A "I note all comments are bullish on future. No hint that we are reaching end of line on reserve replacements? Please see."

MR. CUSACK: May the record show that there is a question mark after "replacements"?

THE COURT: I think the record speaks for itself. Is this in evidence?

MR. CUSACK: Yes, you Honor, it is. But I thought perhaps for the purpose of the transcript—

THE COURT: Well, all right.

Proceed.

BY MR. HEDLUND:

Q Mr. Nugent, what is dust?

A Dust is fine coal that is removed from, let's say, a one and a half inch by Zero coal generally for customers that are prepared to pay a premium price for coal from which dust is removed.

Q What is the practice in the past to dispose or otherwise throw away the dust that was so removed [1851] from the coal that you have described?

A There were times when, in the initial stages, that the dust just wasn't marketable. It presents a handling problem. And in the early stages we threw it on the gob pile. Later we found a market for it. It was sold at a price under the cost of production. However, the combined realization from the dust and the double screen size or premium product was profitable.

[1852] Q Then is it true that in the sale of dust by Freeman, if you will, that you do not actually lose money by such a sale?

A Yes, sir.

Q And when you say that it is sold below the cost of production, this is an unallocated cost of production, is it not, among all of the coal, oil—

A Sold below the minimum run cost of production.

Q Is there any incremental cost in selling dust or producing dust for sale above and beyond the production costs for the coal of the sizes from which dust has been removed?

A I'm not sure that I understand that question.

MR. HEDLUND: Read the question.

THE COURT: Read him the question.

Q (Read by the Reporter.)

BY THE WITNESS:

A If you mean do we incur an additional cost because we do produce this, yes, we do.

BY MR. HEDLUND:

Q And you are able to recover that additional cost, are you not?

A Yes, sir. Yes, sir, we are.

Q You spoke of the difficulties of handling dust. [1853] Could you tell me what those are, please?

A It is difficult to retain it in the car. It is subject to blowage. In the early stages we found when we put a car of dust behind the box car, when it reached destination you had a half a car of dust. Those were some of the things we had to overcome, too. It tends to rat hole when it is put in a bin in a boiler room.

Q Could you explain what you mean by "tends to rat hole"?

A Rat hole. The dust is retained on the sides of the bin, and dust flows down through the center.

We later learned by putting vibrators on these bins we could unload it.

MR. HEDLUND: I would like to hand to the Reporter to mark as a defendants' exhibit—if I may, could I go off the record?

THE COURT: You may.

(There was a discussion off the record, after which the following further proceedings were had herein, to-wit:)

MR. HEDLUND: Would you mark that as Defendants' Exhibit No. 229, and having done so, would you hand it to the witness, please?

MR. CUSACK: Just a minute. May we have a copy?

[1854] MR. HEDLUND: Yes.

(The document was marked as Defendants' Exhibit No. 229, for identification.)

[1855] BY MR. HEDLUND:

Q I ask you, Mr. Nugent, is the information set forth on this document with respect to the estimated deep tonnage dedicated to existing mines of Freeman and other coal reserves of Freeman true and accurate to the best of your knowledge and belief?

A Yes, sir, I think so.

Q This totals, does it not, something in the neighborhood of 483 or 484 million tons of coal.

A Well, I haven't added them, but I would accept that.

Q Could you give me an estimate of approximately what percent of these reserves have a sulphur content of less than 2.5 percent?

A The coals produced by Orient No. 3, Orient No. 6 and Orient No. 4.

Q Are in the category of sulphur content less than 2.5 percent?

A 2.5, I thought you said.

Q Yes, 2.5.

A That is right.

Q Would that then mean that all of the reserves assigned here to Orient No. 3, 4 and 6, all or substantially all would be in that sulphur category?

[1856] A Would you state that again, please.

THE COURT: Read the question.

Q (Read by the Reporter.)

BY THE WITNESS:

A Yes, Orient No. 3, 4 and 6.

BY MR. HEDLUND:

Q Your answer is yes, they would be?

A Yes, sir.

Q Would you be able to give me an estimate as to what percent of the reserves shown on the second page under the title "Other Coal Reserves" are in a sulphur content category of 2.5 percent or less?

A All of the Jefferson County reserves may not be below 2.5 percent. The northern part of our acreage could well run a little bit above that.

Now, all of the reserves assigned or that may be assigned to No. 3 and to No. 6 will run in the neighborhood of 1.5 percent in sulphur.

The reserves on the first page assigned to 3 and 6 are somewhat flexible in that we could use additional reserves not now assigned at some future date if it appears to be economical.

Q I see that the totals for Jefferson and William Counties—those are the counties for Orient No. 3, 4, [1857] 5 and 6, are they not?

A Yes, sir.

Q I see these total—

A I can't say that all of the reserves unassigned in Williamson County will run below 2.5 percent in sulphur.

Q Could you give me some estimate as to roughly what percentage it would be?

A It would be a guess. I would say half.

Q What about Jefferson County?

A Jefferson County, again, that is not clearly defined in that the reserves that will be assigned to Mine No. 7 may not all run below 2.5 percent.

Mine No. 7 is the mine that is planned for future date.

Q Of the 97 million tons in Jefferson County, would half of these reserves be less than 2.5 percent sulphur or would it be more than half?

A Probably less than half.

[1858] Q There is an advertisement in evidence, Mr. Nugent, referring to, I believe, the plans of Freeman to open up Orient No. 7, Orient No. 8, and a new mine in central Illinois. What is the status of those plans, if any?

A We have abandoned the idea of opening No. 8. We had put a manned shaft, a new manned shaft at the Orient No. 3 mine. We will assign more acreage to Orient No. 3.

We have room now in reserves only for one more mine in Jefferson County. That would be No. 7.

Q Would you be able to estimate when Orient Mine No. 7 will be open?

A Well, not at this moment. We haven't completed No. 6. As soon as we get No. 6 finished, which will be sometime the latter part of this year, we will then go to work on No. 7.

Q Can you tell me approximately what you estimate is for—well, let me ask you this first. What was the total production of Freeman in 1969?

A I would say about 8 million tons, and that is a guess now.

Q What is your estimate for the production of Freeman in 1970?

A It will increase. We cut back at No. 5 because [1859] of some roof problems that we had there. That mine was producing about 2 million tons a year. We have

cut it back to 1 million tons a year, perhaps a little more.

Orient No. 6 is now producing at the rate of about 8,000 tons a day. By the end of the year, we should have it up to 12,000 or 13,000 tons a day.

Q Mr. Nugent, I show you what has been received in evidence as Defendants' Exhibit 35, which is a copy of a coal contract between United Electric Coal Companies and Central Illinois Light Company, dated September 30, 1968. I direct your attention to the supplement of that contract and a portion of paragraph 3, about in the middle, where it reads as follows:

> "In the event that prior to the expiration of this contract reserves of seller in the No. 5 and 6 seams of coal in Fulton County are exhausted, seller will make shipments under this contract from present or planned mines of Freeman Coal Mining Corporation located in the central Illinois field where the company has reserves of No. 6 seam coal approximating 400 million tons."

My question is, to what does that 400 million tons refer?

A That is coal in place rather than recoverable [1860] coal.

Q What percentage of recovery—

A It is about 250 tons of coal recoverable at the outside.

Q You say 250?

A 250 at the outside.

Q Million that would be?

A 250 million tons at the outside. That could well be a little on the high side.

Q Mr. Nugent, is there a possibility that the Cuba mine will close this year?

A I think so.

Q Would you tell me why?

A Well, we are into old works there; we are running into difficulty. When our tonnage gets down to something like 300,000 tons a year, it won't be economical to continue to operate it.

Q Why does old works interfere with strip mining?

A We are digging the No. 6 seam coal. The No. 5 seam underneath it was mined many years ago.

Q Would that have been by deep mining?

A By deep mining, yes.

Q What sort of problems does that pose?

A It is an unstable area.

[1861] Q Are there any properties at the Cuba mine that you were unable to purchase?

A Yes. We had a tract of land there that for many years we thought we should acquire, known as the Murphy tract. We though it contained a million and a half tons of coal.

We couldn't understand why this man wouldn't sell, and be included in our reserves, because we were able to pay and could well afford to pay him three times the value of his farmland. We just did not acquire it. He would not permit us to drill it and we could never get an option to drill it. We have mined up to it and around it.

It now appears that there was not a million and a half tons there. We ran into some voids and some washouts.

Had we been able to acquire the Murphy tract, we could have acquired a tract beyond that known as the Phillips tract. We have given up, of course, and moved away and their equipment is gone.

We never will know why Mr. Murphy wouldn't take three times the value for his land, but it belonged to Mr. Murphy.

Q In terms of your mining operation at Cuba, [1862] would it be feasible to move the equipment back, to try to come back to pick up this acreage if Mr. Murphy ever changes his mind?

A No, sir. We have burned our bridges behind us.

Q Do you recall approximately what the estimated tonnage was in the Phillips' tract that you were also unsuccessful in acquiring?

A Well, not offhand. It wasn't as great, of course, but it was a worthwhile piece of land.

THE COURT: Would now be a good time to break?

MR. HEDLUND: Yes, your Honor.

THE COURT: All right. We will recess until 10:00 o'clock tomorrow morning. Unless something unexpected comes up, we should get started by 10:15 or 10:30 at the latest and go all day.

Thank you.

(The hearing in the above-entitled cause was recessed to 10:00 a.m., Thursday, April 16, 1970.)

[1863]

IN THE UNITED STATES DISTRICT COURT
NORTHERN DISTRICT OF ILLINOIS
EASTERN DIVISION

No. 67 C 1632

UNITED STATES OF AMERICA, PLAINTIFF

vs.

GENERAL DYNAMICS CORPORATION; THE UNITED ELECTRIC COAL COMPANIES; and FREEMAN COAL MINING CORPORATION, DEFENDANTS

Before HON. EDWIN A. ROBSON, Judge,
Thursday, April 16, 1970,
10:30 o'clock a.m.

PRESENT:

MR. JOHN THOMAS CUSACK,
MR. ROBERT L. EISEN,
MR. RONALD L. FUTTERMAN,
MR. HUGO SIMS, and
MR. RICHARD J. BRAUN,

appeared for Plainitff;

MR. HAMMOND E. CHAFFETZ,
MR. REUBEN L. HEDLUND,
MR. DONALD G. KEMPF, JR., and
MR. RICHARD H. IRVING, III,

appeared for Defendants.

ALSO PRESENT:

MR. JAMES M. FOLSOM

[1864] THE CLERK: Case on trial.

THE COURT: Good morning.

Are there any matters to take up with the Court before proceeding?

MR. CUSACK: Good morning, your Honor.

With the kind concurrence of Mr. Hedlund, we would like to take a witness out of order. He is Mr. Hopper of the Ayshire Collieries.

THE COURT: All right, have the witness take the stand.

(Witness duly sworn.)

HOLLIE HOPPER,

called as a witness by and on behalf of the Government, was examined and testified in rebuttal as follows:

DIRECT EXAMINATION

BY MR. CUSACK:

Q Please state your full name.

A Hollie Hopper.

Q What is your home address, please?

A 620 Lawndale Drive, Plainfield, Indiana.

Q By whom are you employed, sir?

A Ayrshire Coal Company, Division of American Metal Climax.

Q What is your position at Ayshire?

[1865] A Vice president of operations.

Q How long have you held that position?

A Since 1967.

Q What position did you hold prior to that time?

A General Superintendent of the Mining Operations.

Q How long did you hold that position, approximately?

A Nine years.

Q In reference to your Sun Spot Mine, Mr. Hopper, has the Sun Spot Mine of Ayshire been profitable in the past?

A Yes. We consider Sun Spot a profitable operation. It has had periods in which it was less profitable than other periods.

Q In 1969 where did the Sun Spot Mine rank among the Ayshire mines in profitability?

A Either in fourth or fifth position.

Q How many mines did you operate in 1969?
A Ten operations.
[1866] Q Is the Sun Spot Mine profitable now?
A Yes, it is.
Q What do you expect to be the profitability of Sun Spot in the future?
A We would expect it to be a profitable operation.
Q Sir, what is the overburden ratio of the remaining coal reserves of Ayrshire at Sun Spot?
A The average overburden ratio is approximately 30 plus, between 30 and 31.
Q To one?
A To one, yes.
Q What do you expect to be the remaining life of the Sun Spot Mine?
A Some 14 to 15 years.
Q Is that with the present equipment?
A With the present equipment.
Q Sir, based on your knowledge and experience in the mining business, has stripping ratios in strip mines been increasing over the past 25 years?
A Yes, they definitely have.
Q Could you tell us, sir, when were the Sun Spot Mines—excuse me. Let me rephrase that question.
When were the Sun Spot coal reserves acquired by Ayrshire?
[1867] A In the late 1950's.
Q Is Ayrshire at the present time prospecting for strip coal reserves in Illinois, Indiana and west Kentucky, for the possible opening of a new mine?
A Yes.
Q Has Ayrshire acquired strip coal reserves in Illinois, Indiana, and west Kentucky since 1960 for new strip mines?
MR. KEMPF: We are going to object unless he breaks this down, as we have in the past, according to states.
MR. CUSACK: I don't understand. What states?
THE COURT: According to states.
MR. KEMPF: Yes.

BY MR. CUSACK:

Q Has Ayrshire acquired strip coal reserves in Illinois since 1960, for the possible development of a new strip mine?

A Yes, sir.

Q Has Ayrshire acquired strip coal reserves in Indiana since 1960 for the possible development of a new strip mine?

A Yes, sir.

[1868] Q Has Ayshire acquired strip coal reserves in west Kentucky since 1960 for the possible development of a new strip mine?

A No, sir.

Q Mr. Hopper, do you know of any other coal producers who have acquired since 1960 any strip coal reserves in Illinois for the development of a new strip mine?

A Yes.

Q Since 1960, has Ayshire acquired new deep coal reserves in Illinois for the development of future underground mining?

A I beg your pardon. Since what date?

Q Since 1960, has Ayshire acquired new deep coal reserves in Illinois for the development of future underground mining?

A Yes.

Q Since 1960, has Ayshire acquired new deep coal reserves in Indiana for the development of future underground mining?

A We have some deep reserves under option acquired since 1960.

Q Would these reserves be for the possible development of a future underground mine?

[1869] A Yes, it is a possibility.

Q The deep coal reserves which Ayshire has acquired since 1960 in Illinois, would this be for the possible future development of an underground mine in Illinois?

A Yes, it is a possibility.

Q Could you tell us, sir, how Ayshire got into the deep or underground mining business?

A Well, early in the 1950's, Ayshire acquired two underground operations, small operations: one in central Indiana and one in the southern Illinois area.

Q In regard to the mine in central Indiana, could you tell us the approximate tonnage of that mine?

A Approximately 400,000 a year.

Q Could you tell us the approximate tonnage of the mine acquired in southern Illinois?

A About 250,000.

Q Following this, sir, did Ayshire itself open up a new deep mine?

A Yes. In 1959, Ayshire opened what is known as the Thunderbird Mine.

Q Where is that located, sir?

A Well, it is located at Shelburne, Indiana, [1870] which is six or eight miles north of Sullivan, Indiana.

Q Is this a profitable mine, sir?

A No, it is not.

Q Could you tell us the reason?

A Well, number one, it has very poor roofing conditions which provides us with an exorbitant cost in that respect. Secondly, probably Ayrshire negotiated a rather poor contract realization-wise. Frankly, the price of the coal was just much too cheap.

Q In your opinion, sir, do you feel that a coal company with greater experience in deep mining than Ayshire could have done any better with Thunderbird?

A Well, knowing the physical conditions that we have encountered there, I rather doubt that anyone could have made a profitable operation out of it.

Q Where did Ayshire obtain the personnel to staff the Thunderbird Mine?

A Well, having acquired these two underground operations, small underground operations in the early fifties, the personnel from those operations provided a nucleus to build an organization at the Thunderbird Mine.

[1871] Q Does Ayrshire plan to open up any new deep mines in Illinois?

A We have no definite plans. However, we have feasibility studies underway that will determine the final outcome.

Q Does Ayrshire plan to open up any new mines in Indiana?

A Not at the present.

Q Does Ayrshire own a deep coal reserve deposit known as the Denmark Deep?

A Yes, we do.

MR. CUSACK: I think it might be helpful if we could locate it on the map.

THE COURT: You may.

BY MR. CUSACK:

Q Mr. Hopper, directing your attention to what has been received in evidence as GX Nugent Deposition Exhibit 38, a map entitled "Shipping Coal Mines in Illinois," can you tell us approximately where the Denmark Deep reserves are located?

A Well, it is down there—

THE COURT: You can step down and point to it, Mr. Hopper.

MR. KEMPF: Mr. Cusack, I don't mean to interrupt [1872] your interrogation, but, as you know, I was planning to provide the Court with a copy of that map. If you would like, I will do so now.

THE COURT: Oh, it is not necessary. I have seen that pointed to. I think I know a little bit about the State of Illinois, too.

All right, you may proceed.

BY MR. CUSACK:

Q Mr. Hopper, could you just tell us generally where the reserves are located.

A It is northwest of DuQuoin, almost north of Pinckneyville, somewhere in this general area right in here.

Q Is it fair to say that the Denmark Deep reserves are located several miles north of Pinckneyville, Illinois?

A Yes, a few miles north of Pinckneyville.

Q Mr. Hopper, do you anticipate that the Denmark Deep Mine will be mined in the future?

A Yes. I feel that the Denmark reserves will be mined in the future. Just how much in the future, I can't say. I believe it largely depends on, oh, the new environ-

mental legislation that is being passed.

Q Could you give us any time approximately in which you feel this mine might be opened?

[1873] MR. KEMPF: Your Honor, I object. The witness said he could not predict how far in the future it would be opened. To ask him for a specific time in light of that—

THE COURT: Well, if he can give an approximate date, he may.

BY MR. CUSACK:

Q If you can, give an approximate date.

A I really have nothing to go on at this time. We would hope to open it within a few years, but I can't see it at this point.

Q Is the Denmark Deep reserves, sir, fairly well situated?

A Yes, they are reasonably will situated, No. 1, because they are reasonably close to what we have as a strip reserve some 15 miles from there. We are expecting to create a market with our strip reserves which might carry over into the deep reserve area.

However, there are some new developments that are presenting possible problems of transportation in view of the possible dredging of the Kaskaskia River which may put other people in a better position than us.

Q I forgot to ask you one question, sir, in [1874] regard to stripping, and it is my last question.

Mr. Hopper, do you know of any other coal producers who have acquired strip coal reserves in Illinois for the development of a mine since 1960?

A I beg your pardon. Would you repeat that?

Q Do you know of any other coal producers or coal operators who have acquired any new strip coal reserves in Illinois since 1960 for the development of a new mine?

A Yes, I do.

[1875] MR. CUSACK: That is all, your Honor. Thank you, sir.

THE COURT: You may cross examine.

MR. HEDLUND: May we have just a moment?
THE COURT: All right.

(There was a short interruption, after which the following further proceedings were had herein, to-wit:)

MR. HEDLUND: Your Honor, could we have a brief recess?
THE COURT: I will be recessing again at 11:30.
MR. HEDLUND: Then if we could have just a couple more minutes.
THE COURT: You may. Let us proceed.

(There was a short interruption, after which the following further proceedings were had herein, to-wit:)

MR. CUSACK: Your Honor, I beg leave of Court. Mr. Futterman reminds me I have to ask one slight question, and I would appreciate—
THE COURT: Any objection?
MR. KEMPF: No objection.

BY MR. CUSACK:

Q Mr. Hopper, prior to Ayshire's acquisition [1876] of the two deep mines which you have testified about, was Ayshire solely in the strip mining business prior to that time?
A Yes.
MR. CUSACK: Thank you, sir. Thank you, your Honor.

(There was a short interruption, after which the following further proceedings were had herein, to-wit:)

THE COURT: Cross examination.

CROSS EXAMINATION

BY MR. KEMPF:

Q Mr. Hopper, isn't it true that during fiscal year 1967 Ayrshire's Sun Spot Mine had a rate of return on investment of roughly between 4 and 5 percent?

A Roughly so, yes.

Q Isn't it true that during fiscal 1968 Sun Spot was a marginal operation, and that during the latter portion of that fiscal year when the mine was operating at overburden ratios of from 33- to 36-to-1 the mine was not operating profitably?

A This is true.

Q Isn't it true, Mr. Hopper, that largely as a result of the operations at the Sun Spot Mine during [1877] fiscal 1968 and in particular in view of the difficulties encountered with spoil stability at the higher ratios mined during that year, Ayshire has redefined its reserves at the Sun Spot Mine?

A Yes, we have.

[1878] Q And is it not true that Ayrshire has changed the limit of the depth at which it will strip at the Sun Spot Mine from the former limit of 80 feet to a present limit of 700 feet?

A That is correct.

Q And isn't it true that Ayrshire has made the decision that in the future it will not mine on a continuing basis at the Sun Spot at overburden ratios exceeding 30 to 1?

A On a long-term average, yes, we do not expect to exceed approximately 30 to 1.

Q Isn't it true that the current profitability of the Sun Spot and the profitability during fiscal 1969 is largely due to the fact that the overburden ratio at which the mine has operated during these periods is around 25 to 1 or 26 to 1 and the fact that no blasting is required in the overburden removal operation?

A This is largely contributing to the profitability.

Q You testified concerning the Thunderbird Mine during the course of your direct examination by Mr. Cusack. You testified that prior to opening the Thunderbird Mine Ayrshire had acquired two companies which did conduct underground mining operations—

MR. CUSACK: Objection, your Honor. The testimony [1879] was that it had acquired two mines.

MR. KEMPF: My question would clear this up.

BY MR. KEMPF:

Q Did you acquire two companies known as the Little Betty Coal Company and the Carmac Coal Mining Corporation?

A Yes.

Q And they operated the Little Betty and the Carmac Mines?

A Yes.

Q You indicated that even someone with more experience and expertise, in your view, probably would not have operated the Thunderbird Mine successively. My question is: Isn't it quite possible that someone who did have a greater amount of experience and expertise in deep mining at that time would not even have opened the Thunderbird Mine?

A Well, this is entirely possible. This is a case of judgment.

Q You indicated that the mine was not profitable. Isn't it a fact that within two years after the opening of the mine it was so clear that mine was not going to be profitable over its life that Ayrshire at that time wrote off $5 million of its investment in the [1880] Thunderbird Mine?

A This is true.

Q And I gather that since that time operating losses have continued?

A Operating losses have continued at that operation for every year of its life except, I believe, for two fiscal years.

Q And that was opened in 1959, you testified?

A Yes, sir, it was.

Q So that in the 11 years, nine of those 11 years the mine has lost money on a operating basis?

A Yes.

[1881] Q In your judgment, Mr. Hopper, if Ayshire had it to do over again, do you think it would be likely that they would open the Thunderbird Mine, in view of what they now know?

A In view of what they now know, absolutely not.

Q Mr. Cusack questioned you about Ayshire's exploration activities in Illinois, Indiana and west Ken-

tucky. I would like to ask a few questions along the same line.

Did Ayshire investigate the possibility of strip reserves in Menard County around Petersburg?

A Petersburg, Illinois?

Q Yes.

A Yes.

Q After exploring for reserves in Menard County, Ayshire decided not to take any options in that area, isn't that true, Mr. Hopper?

A This is true.

Q One of the reasons leading Ayshire not to take options in Menard County was the fact that Ayshire questioned the strippability of those reserves that were located there in view of the depth of the coal and the unconsolidated nature of the overburden, isn't that true?

[1882] A This is true.

Q In view of the fact that in addition to United Electric, Ayshire also investigated and turned down coal reserves in the Menard County, wouldn't you agree that it would be improper to regard United Electric's failure to acquire the reserves located there as an indication that the company was not making serious efforts to increase its strip reserves?

MR. CUSACK: I object. It calls for speculation on the part of the witness.

MR. KEMPF: I think this witness is qualified to answer that, your Honor. Mr. Cusack called him to testify to these matters.

MR. CUSACK: It is pure speculation, your Honor.

THE COURT: The objection is sustained.

BY MR. KEMPF:

Q Let me look at it a different way. I think this will overcome that objection.

Wouldn't you agree, Mr. Hopper, that the fact that a coal company had devoted time and money to the investigation of the field such as that located in Menard County, that that is at least one indication that the company is making serious efforts to enlarge its strip reserve holdings?

[1883] MR. CUSACK: Same objection, your Honor.
THE COURT: The objection is overruled.

BY THE WITNESS:

A Yes. I think it would indicate that the company was attempting to acquire reserves. This is true of all coal companies. They continually carry on an exploration program, so far as I know.

BY MR. KEMPF:

Q I would like now to ask you about another area of reserves in the state of Illinois.

Ayshire investigated, did it not, the coal reserves controlled by one Kenneth Youngs, southeast of the town of Mount Vernon, near the Belle Rive area, is that not true, Mr. Hopper?

A Yes, sir.

Q At the time of its initial investigation, Ayshire concluded, did it not, that largely on the basis of the analysis of the characteristics of the coal, that the field was not economically strippable?

A Well, I would rather say that it was not—I wouldn't agree that it was not economically strippable. It might not be an economical operation because we could not correlate the analysis of the coals to come up to those analyses as representative of the [1884] field. We had failed in our procedures in some manner, which we later did reconcile and find what our problem was.

Q Isn't it your view that the reason for that was that the information supplied to you at the time of your initial investigation by Mr. Youngs was not sufficient in detail to enable an accurate appraisal of the coal's characteristics?

A Well, he had very detailed information and a great deal of information. Probably the greatest problem that we encountered in our failure to recognize and support his analysis was that we did not recognize the procedures or the manner in which he had obtained his cores and channel samples for analysis, and this basically was our problem in not being able to correlate analyses.

[1885] Q And as a result of that problem, you initially dropped your interest in that field, is that correct?

A We did.

Q You know also, do you not, Mr. Hopper, that both Peabody Coal Mining Corporation and Stonefort Coal Mining Corporation also investigated that field and also dropped interest in that field?

A I have heard that—I understood that Peabody Coal Company had investigated it and turned it down. I don't believe I was aware that Stonefort had.

MR. CUSACK: I move to strike on the ground of hearsay, your Honor, the last answer.

MR. KEMPF: He has indicated he understood this had happened, and he said he had not heard of the other. Why don't we have the answer read back?

THE COURT: I heard the answer. It may stand. Proceed.

BY MR. KEMPF:

Q I will now ask you a question similar to my question about Menard County. Wouldn't you agree, Mr. Hopper, that the very fact that United Electric had devoted its time and money to the investigation of the coal reserves in this area is at least one indication that that company was making serious efforts to enlarge its strip reserve holdings?

[1886] MR. CUSACK: I object, your Honor, on the ground that it calls for speculation by the witness.

THE COURT: The objection is overruled. You may have a standing objection to any similar question.

MR. CUSACK: Thank you, your Honor.

BY MR. KEMPF:

Q You may answer, sir.

A I think it is a clear indication that they were attempting to find and presumably acquire additional reserves.

Q Mr. Cusack discussed with you the so-called Denmark Deep acreage. Isn't it a fact, Mr. Hopper, that the likely cost of recovery of the Denmark Deep and the nearby Round Prairie Field would be greater than that of the strip reserves in Belleville against which this coal would have to compete, such as specifically Ayrshire's own Denmark strip acreage?

A Well, I can only answer for that portion that relates to our Denmark Deep, not the Round Prairie, because I know nothing about it. But, yes, we will produce coal more cheaply in our strip Denmark field than in the deep Denmark area.

[1887] MR. CUSACK: Will counsel stipulate that the situation at Denmark is the same as at Round Prairie, as indicated by his question?

MR. KEMPF: I will indicate to Mr. Hopper—

I will not stipulate because I am, obviously, like the witness, he is not familiar with our property and we are not familiar with his.

I will indicate, however, that the coal is very close to the field that United Electric owns known as the Round Prairie Field.

BY MR. FEMPF:

Q Is that not true, Mr. Hopper?

A Yes, I am sure that is correct.

Q Isn't it a fact, Mr. Hopper, that in attempting to sell the coal from the Denmark Deep area competitively, it would be at a competitive disadvantage from a transportation viewpoint in comparison to other deep reserves held in the Belleville area such as Peabody's undeveloped reserves along the Kaskaskia River?

A If and when the Kaskaskia is canalized, they will be in a better position freight-wise to offer coals to the market.

Q Isn't it a fact that the higher sulphur content of the Denmark Deep acreage might be another factor further delaying the development of those reserves?

[1888] A Yes. I believe I stated earlier that I thought that, due to the new environmental legislation that is being passed, that it place these reserves in a doubtful position for their mineability in the very near future.

Q Mr. Cusack asked you about the Denmark strip acreage. How long did Ayshire control the Denmark strip acreage before the decision was made to open a mine there?

A Well, we have held the Denmark strip acreage since either the year 1926 or 1927.

Q So, that is over 40 years?
A Yes, that is true. We acquired it at a tax sale.
Q Mr. Cusack also referred to the fact that since 1960, mines haven't been opened on new strip reserves.
MR. CUSACK: I did not refer to that, your honor. That is not the question I asked.
THE COURT: Would you read the question.
[1889] THE REPORTER: "Q Mr. Cusack also referred to the fact that since 1960, mines haven't been opened on new strip reserves."
MR. KEMPF: "Have" is the word I said, not "haven't."
MR. CUSACK: I did not ask that question, your Honor.
My question was "Do you know of any other coal producer which have acquired new strip coal reserves for the possible development of a new mine in Illinois since 1960?"
MR. KEMPF: I stand corrected.
THE COURT: All right Revise your question.
MR. KEMPF: Yes, your honor.

BY MR. KEMPF:

Q Isn't it a fact, Mr. Hopper, that coal reserves presently available for acquisition or coal reserves acquired in recent years are bought with the expectation by the company acquiring the reserves that they will be mined in the long run rather than the short run, and that many of these reserves may not be developed for 30, 40, 50 or more years?
MR. CUSACK: I object, your Honor. I think you better lay a foundation that he has information on that.
THE COURT: Well, if the witness knows, he may answer.
MR. KEMPF: I think this one clearly follows up [1890] Mr. Cusack's question.
THE COURT: I have ruled. I said that if the witness knows, he may answer.

BY MR. KEMPF:

Q Would you like the question back, again?
A I am not quite sure I understand the question.

THE COURT: Would you read the question, please.

Q (Read by the Reporter.)

BY THE WITNESS:

A Well, if I may, I believe there are two questions to be answered there. At least I see it as a two-part question.

THE COURT: You are quite right.

BY THE WITNESS:

A No. 1—

THE COURT: Reform your question. There was no objection on that ground. I thought maybe the witness could answer it.

MR. KEMPF: Well, if the witness understands both questions, he may answer them, or I will—

THE COURT: Do you understand both questions?

THE WITNESS: Yes, sir.

THE COURT: All right.

[1891] BY THE WITNESS:

A Well, number one, yes, reserves that may be acquired here in the next few years, or reserves that have been acquired in the most recent past, it is entirely possible that a great portion of them will not be mined for a number of years.

When you say 30 or 40 years, I probably could not agree with the 30 or 40 years. I will have to say somewhere in the future.

Now, the other part of the question that I believe I understood, some of the reserves that have been acquired and may be acquired in the future, I can foresee that they could be developed immediately.

BY MR. KEMPF:

Q Just as Ayrshire developed its Sun Spot reserves shortly after their acquisition?

A Yes, because primarily, now, you are talking about —you are putting reserves in one category. There are two kinds of reserves: deep and strip.

Q To follow that, just as the Banner Mine of United Electric was opened up shortly following the acquisition of those reserves?

A Yes.

Q You raised the fact that these are both strip and deep [1892] reserves. I would like to address myself to that for a moment.

Isn't it a fact, Mr. Hopper, that it is common knowledge within the coal industry that strip reserves available for acquisition are in extremely short supply, and that if there were known economically recoverable reserves, there would be an eager scramble to acquire them?

A Yes, this is true.

Q Mr. Hopper, are you familiar with the mining engineering firm known as Paul Weir & Company?

A Yes.

Q Ayrshire Collieries retained the Paul Weir Company to prepare an analysis of Ayrshire's property in connection with Ayrshire's merger discussions with Ashland Oil and American Metal Climax, is that correct?

MR. CUSACK: Objection, your Honor. This is outside the scope of the direct examination. We didn't even mention Paul Weir.

THE COURT: Do you have any comment?

MR. KEMPF: Yes, I do, your Honor. This witness is being called to rebut the evidence concerning the areas that he is going into this morning, that has been introduced by the defendants. One of the important [1893] items of evidence is a report which was prepared on these subjects by the Paul Weir Company.

I am merely asking this witness whether he is familiar with this company. I have one additional question, and that is to find out his regard for this company.

MR. CUSACK. I believe it is still outside the scope. I don't see what relevance it has to the direct examination.

MR. KEMPF. It is the very evidence he seeks to rebut, your Honor.

THE COURT: All right. Let me inquire, you are putting this witness on in rebuttal, is that correct?

MR. CUSACK: Yes, your Honor.

THE COURT: To rebut evidence introduced by the defendants.

MR. KEMPF: If I might, your Honor, if Mr. Cusack will stipulate that none of Mr. Hopper's testimony in any way rebuts any of the information in this exhibit, I will be happy to withdraw my line of inquiry.

MR. CUSACK: No, you Honor, I won't.

THE COURT: All right. The objection is overruled then.

MR. KEMPF: Can I have the question re-read?

THE COURT: Read the question.

[1894] THE COURT: Can you ask the question again?

MR. KEMPF: Yes, I can.

BY MR. KEMPF:

Q Ayrshire Collieries retained Paul Weir Company to prepare an analysis of Ayrshire's properties in connection with Ayrshire's merger discussions with Ashland Oil and American Metal Climax, isn't that correct, Mr. Hopper?

A Paul Weir Company was not retained specifically to make an evaluation of Ayrshire for Ashland or Amex.

Q They were retained by you to make such an analysis?

A Correct.

Q The Paul Weir Company is one of the world's most widely known and highly regarded mining engineering companies, isn't it, Mr. Hopper?

A Yes. I believe they enjoy a very fine reputation.

Q I would like at this point to have you look again at what has been received in evidence as Nugent Deposition Exhibit 38.

MR. KEMPF: On this one, your Honor, I am going to be asking some questions that will require a detailed examination.

THE COURT: All right.

[1895] MR. KEMPF. I will provide the Court with a copy of the map.

THE COURT: All right.

MR. KEMPF: I have folded the map, your Honor, to the area which I will be referring to.

THE COURT: All right.

BY MR. KEMPF:

Q Mr. Hopper, the Sun Spot Mine is the mine identified with the number 57 on Nugent Deposition Exhibit 38, is it not?

A I am sorry, I can't see.

THE COURT: You may step down, sir, and look at it.

BY MR. KEMPF:

Q Would you step down, please.

A Yes.

MR. CUSACK: May I join you?

THE COURT: You certainly may.

MR. KEMPF: I will only be having a few questions, your Honor, if the witness may stay here.

THE COURT: He may.

BY MR. KEMPF:

Q The Sun Spot Mine is close to the Chicago, Burlington & Quincy Railroad, is it not?

A Yes, sir.

[1896] Q The town of Industry is not near a railroad, is that correct?

MR. CUSACK: Objection, your Honor, as being beyond the scope of the direct examination. The Government didn't ask anything regarding the Industry Field of this witness.

MR. KEMPF: Your Honor, I can quote Mr. Cusack's representations to the Court the other day why he was being called. I think your Honor will recall that he indicated Mr. Hopper was being called because of the proximity of the one field to the other, and to draw an analogy between the mineability conditions at one, showing that the other was mineable.

MR. CUSACK: Your Honor, I asked the witness no question regarding the Industry Field or the analogy

between the mines, the Sun Spot Mine and the possible future mining of the Industry Field.

MR. KEMPF: Again, your Honor, if Mr. Cusack will stipulate that his testimony provides no insight into whether the Industry Field can be mined or not, I will be happy to withdraw from this line of inquiry.

MR. CUSACK: That can be argued. That is a matter of argument. That is not a matter of evidence.

THE COURT: Well, we had an agreement. The Court [1897] allowed you to call different ones within the scope of that. I will allow this witness to testify subject to your objection.

Q (Read by the Reporter.)

BY THE WITNESS:

A Well, it is some 12 to 15 miles from a railroad.

[1898] BY MR. KEMPF:

Q As a rule of thumb in the industry for estimating the approximate capital cost of constructing a railroad, isn't it the usual practice to base those estimations on a cost of approximately $30 per foot?

A This is the normal estimation for cost of a railroad of any considerable length.

Q I have no further questions with regard to the map, and you may resume the chair, please.

A (Witness complying.)

Q When did the Sun Spot Mine begin its operations, Mr. Hopper?

A In 1962.

Q What is the approximate annual production of the Sun Spot Mine?

A Oh, it ranges between 800,000 and 900,000 tons per year.

Q So that there have been withdrawn from that field of reserves between 7 and 8 million tons of coal at the present time, is that correct?

A Approximately so.

Q Isn't it a fact that Ayshire controls an additional 12 million tons of coal at that area directly and an additional 8 million tons of coal by location for [1899]

a total remaining reserve of approximately 20 million tons?

A This is the reserves as we presently calculate them, yes, and we are calculating them on the basis of the capability of our present equipment.

Q To the extent that there was a difference in the magnitude of the reserves at the Industry Field in comparison to the Sun Spot Field, that would be an important factor to consider in evaluating whether the Industry Field could be mined at a profit, wouldn't it?

A By Ayshire's standards of evaluation, it would be.

Q The question of whether or not blasting would be required to remove the overburden at the Industry Field would be an important consideration as to whether that field is an economically recoverable field, wouldn't it?

A Yes, it is always an important functional cost to be considered.

Q Differences in the characteristics of the coal between, say, the Sun Spot and the Industry Field, particularly in reference to sulphur content, would be an important consideration to be looked to in evaluating the economic recoverability of the Industry Field, would it not, Mr. Hopper?

[1900] A Yes. All physical characteristics of the coal and the overburden overlying the coal, they are all important and relative to the study.

Q Isn't it true, Mr. Hopper, that each field of reserves must be evaluated in its own right and with reference to the specific conditions, locations, characteristics of the coal and the like that pertain to that field in determining whether or not that field can be recovered at a profit?

A Yes, this is a very important part of it.

When you say "recovered at a profit," the other factor there is the price of coal that you can market it for.

[1901] Q In comparison particularly to the price that the coal can be sold at mines that may be nearby, for instance, that have no capital costs for the construction of a 12 to 15 mile railroad, wouldn't that be an important factor?

A Yes, it definitely would.

Q In fact, would it be your opinion that two fields could be right next to each other, one on side of the road, and the other on the other side of the road, and that each might have its own characteristics and each might have a completely different equation in determining whether it is an economically recoverable field of reserves?

A Yes. Every field of coal is an individual within its own right, and each has its own peculiarities.

MR. KEMPF: Your Honor, I am just about done, if I might confer with my colleague for a moment.

THE COURT: You may.

(There was a short interruption, after which the following further proceedings were had herein, to-wit:)

THE COURT: Proceed.

BY MR. KEMPF:

Q I am going to ask you two questions, Mr. Hopper, [1902] based on some assumptions. I want you to make the following assumptions:

Assume a coal company operating four mines in Illinois.

Assume that their combined annual production is approximately five to six million tons.

Assume that these are all strip mines.

And assume that the reserves of these mines will be exhausted in, say, from two to fifteen years, depending upon the mine.

Based upon those assumptions, Mr. Hopper, in your professional opinion, wouldn't it be a mistake to force that company to operate independently in the belief that strip reserves were readily available which would enable the company to remain in business in the future at its current levels of production?

A Well, it would be my opinion that they would be in a very poor position to live up to the situation that they had been placed in, because I seriously doubt if they could acquire additional reserves to that extent to maintain that sort of production over a prolonged period of time.

Q Let me ask you a second question based on the same assumptions that I just gave you and one addit- [1903] tional assumption, the additional assumption being that the company in question has no experience or expertise in deep mining.

Based on those assumptions, Mr. Hopper, in your professional opinion, wouldn't it be a mistake to force this company to operate independently in the belief that underground reserves were available which could be developed in the short run and that the company in question could, notwithstanding its lack of experience or expertise in deep mining, successfully make a grass-roots entry into deep mining?

MR. CUSACK: Your Honor, the Government objects to the form of the question. He is making an argument, using color words, assumptions not in the record. We object on that basis.

MR. KEMPF: These are all assumptions we have heard from myriad testimony.

THE COURT: He may answer, subject to the objection.

BY THE WITNESS:

A Well, I certainly believe that they would be in a very awkward position and probably would have extreme difficulty in obtaining the talent to operate underground operations if they didn't already have them within their own organization.

[1904] MR. KEMPF: I have no further questions, your Honor.

THE COURT: All right. We will take a five-minute recess.

(There was a short recess, after which the following further proceedings were had herein, to-wit:)

* * * *

[1906]

REDIRECT EXAMINATION

BY MR. CUSACK:

* * * *

Q Sir, if I suggest to you that in 1950 Paul Weir Company estimated that there was approximately 304 million tons of strip coal reserves in Illinois available for strip mining and that since 1950, 400 million tons have been strip mined in Illinois, in your opinion would the Paul Weir Company estimates tend to be conservative?

A Based on those facts, it had to be.

Q Isn't the general reputation of Paul Weir that he is conservative in regard to coal reserves?

A I have to—

MR. CUSACK: May I rephrase the question, your Honor?

THE COURT: You may.

BY MR. CUSACK:

Q Isn't the fact, sir, that Paul Weir Company has a reputation for being generally conservative in regard to the mineability of coal reserves?

A I have to confine my answer to knowing his evaluation of Ayrshire only. I am not familiar enough with his evaluations of other reserves for other companies. But in my considered judgment, in his evaluation of Ayrshire as to mineable reserves and his complete approach, it was rather conservative.

Q So, assuming that Ayrshire had not opened the [1907] Thunderbird Mine, would Ayrshire still be interested in opening a new deep mine?

A Yes, under certain conditions, I suppose that we would be. There are many problems to be solved in opening underground mines today, and if you had underground reserves that might have a particular attraction to the market, then you would be more likely to develop them. I know that in our studies of what we might expect to do with underground reserves, we are going to make a very long, hard study of them and explore the best talent we can to give us an opinion before we ultimately spend money.

[1908] Q In regard to stripping ratios, isn't it true, sir, that as stripping ratios increased in the coal mining business, the coal reserves which were once thought to

be not mineable by the strip method have become economically mineable?

A Historically speaking, this is true because of the development of bigger, better and more expensive stripping tools.

Q If the Industry Field could be mined with equipment moved from a distance of approximately 20 miles, 20 to 30 miles, which equipment was in good repair, was paid for and had fully been depreciated, would this be an important factor in making a mine which was otherwise thought to be marginal a profitable operation?

A Yes. It would be a very important factor, but you give me very little information to base a judgment on, because there are many other factors. I haven't the slightest idea of the capability of a tool you may be talking about.

Q Isn't the cost of new stripping equipment the major cost involved in the opening of a strip mine?

A A reasonably good rule of thumb is that your major stripping tool could very well represent nearly 50 percent of your capital investment.

[1909] Q Mr. Hopper, what do you expect to be the future average overburden at the Sun Spot Mine?

A The future average overburden to be stripped at the Sun Spot Mine with the present equipment we would expect to be in a ratio not greater than 30 to 1 for the average.

[1910] Q Do you expect it to be under 30 to 1 on an average?

A For short periods of time it could be, because when we speak of average overburdens of for instance 30 to 1, then during the given period of measurment there are times when you must be under 30 and times when you are necessarily over 30 to obtain your average.

Q But for the average continued life of this mine you would estimate that it would be approximately 30 to 1?

A Yes.

Q And you expect the Sun Spot Mine to be profitable for its remaining life?

A Yes. We hope for it to be.

Q And in your best estimate, do you think it will be?

A Based on present day trends, I am sure it will be.

Q Sir, did Ayrshire benefit from its experience in regard to the opening and operating of the Thunderbird Mine?

A Yes, we did benefit from this experience.

Q In regard to the question Mr. Kempf asked you in regard to the Kenneth Young property at Mt. Vernon, you do know, do you not, that this property is now being [1911] developed into a strip mine?

A Yes. I know that it is being developed.

Q If a strip mining company was controlled for over 10 years by a corporation also engaged in the deep mining business, do you think it is likely that the strip mining company would make plans to go into underground mining on its own?

A Are you specifically referring to a complete separate entity that would be controlled only by the strip operation?

Q No. I am talking about a strip mining company which is controlled, its ownership, its stock control, is in the hands of another corporation, which is also in the deep mining business in the same area—based on that assumption, do you think that it is likely that the strip mining company would make plans to go into underground mining on its own?

MR. KEMPF: Your Honor, I am not sure I understand the question as it has been modified. Could you restate it, or could we have it read?

THE COURT: Read the question.

Q (Read by the Reporter.)

MR. KEMPF: You refer to "also in the deep mining business", which I do not think your question intended. [1912] I am not sure.

THE COURT: Are you objecting?

MR. KEMPF: Yes. I don't understand the question. At first I thought he had indicated that one was not in the deep mining business. This latter question indicates that the other company is also in the deep mining business, and I am not sure what Mr. Cusack means.

MR. CUSACK: I will rephrase my question.

THE COURT: Rephrase your question.

BY MR. CUSACK:

Q Assuming, Mr. Hopper, a strip mining corporation, which is controlled by a corporation engaged in the deep mining business in the same state—do you think it likely that the strip mining company would make plans to go into underground mining on its own?

A Well, I suppose this would depend largely on corporate set-up, but just in answer to your question, I would certainly think that the strip mining company as such would not go into the underground mining, but the company controlling, since they had underground talent, that they would develop the underground operation rather than the strip portion of it.

[1913] MR. CUSACK: May I have a consultation with my colleagues just for one moment?

THE COURT: You may.

(There was a short interruption, after which the following further proceedings were had herein, to-wit:)

BY MR. CUSACK:

Q Mr. Hopper, do you believe that in the future your company will consider acquiring strip coal reserves in Schuyler or McDonough Counties, Illinois? I direct your attention, sir, to—

A That is the area west of our Sun Spot operation?

Q Yes, sir.

A Well, it is a possibility.

Q Would your answer be the same, sir, in regard to Ayrshire possibly acquiring strip coal reserves in Brown County, Illinois?

A Excuse me. Where is Brown County?

MR. CUSACK: Mr. Sims, if he may, your Honor, could locate Brown County for us.

THE COURT: All right.

MR. SIMS: (Indicating)

BY MR. CUSACK:

Q (Indicating.)

[1914] A Well, we, Ayrshire, are in a position not to

turn down any strip reserves that are of sufficient numbers that could justify a strip coal mine in the future. We are definitely interested in strip reserves in any sizable amounts.

Q And Ayrshire is continuing to explore for these reserves, is it not?

A We carry on an exploration program completely daily the year-round.

Q Particularly in reference to Illinois?

A In reference to this continent.

Q And you are still prospecting for strip reserves in Illinois, sir?

A Yes.

Q And in Indiana?

A Yes.

Q And in west Kentucky?

A Yes.

MR. CUSACK: Thank you very much, Mr. Hopper.

THE COURT: Is there any recross examination?

MR. KEMPF: I have one question, your Honor.

RECROSS EXAMINATION

BY MR. KEMPF:

Q Mr. Cusack asked you whether it might be possible to find some strip reserves in McDonough and Schuyler [1915] Counties sometime in the future.

My question is, do you consider it likely that Ayrshire will find a field of reserves which will support an economic mine during the course of the next five to ten years in the area of those counties, which is located on a line through Industry or west of there, and you can look at the map, if you would like, sir, to assist you in making that determination.

A We have done exploration in this general area, and we don't think there are reserves of any sizable amount in the area. We do know, of course, there are small pods of coal, but they certainly aren't large enough for any justification for a coal mine.

• • • •

[1918]

FRANK NUGENT,

called as a witness by the defendants herein, having been previously duly sworn, resumed the stand and was examined and testified further as follows:

DIRECT EXAMINATION

(resumed)

BY MR. HEDLUND:

Q Mr. Nugent, would you explain, please, the background and the function of the corporation and facility known as Rail-To-Water, Incorporated?

A It is a device that was built a good many years ago to transfer coal from railroad cars to lake vessels.

Q Is it still in operation?

A Yes, sir.

Q Who owns Rail-To-Water, Inc.?

[1919] A Its stock is owned by a large group of coal companies. Those same coal companies own some bonds on the facility.

Q Does United Electric utilize the facilities of Rail-To-Water, Inc., to any substantial degree?

A No, not directly. I believe that we have taken some coal from the Fidelity Mine and mixed it with coal from southern Illinois in a lake vessel.

Q Other than that, over the past two or three years, has United Electric placed any substantial tonnage across that facility?

A No, sir.

Q Mr. Nugent, reference has been made in the record by the Government to a possible—well, I don't know whether the word was "merger" or "affiliation," but either way, with the Sahara Coal Company.

What if any problems would be involved in such a merger?

A Well, I think some very serious problems. Sahara employees, workers that belong to the Progressive Mine Workers Union that are classified by the United Mine Workers Union as being non-union workers.

Q Why would that cause a problem?

A The contract with United Mine Workers Union [1920] provides a penalty of 80 cents a ton, or rather, a payment of 80 cents a ton to the United Mine Workers Welfare Fund for coal not mined by their members and handled by a signator of the United Mine Workers labor contract.

Q So that as I understand it, you would then be faced with a 90-cent per ton penalty because of that?

A Well, I think you would have a problem greater than that. I don't believe the United Mine Workers would be digging any coal while you have that affiliation.

Q Notwithstanding the 90 cents?

A Notwithstanding the 90 cents.

80 cents, it is, not 90 cents.

Q Mr. Nugent, I want to hand you what has been received in evidence as Defendants' Exhibit 79 which is a series of advertisements by General Dynamics and an attached schedule of where those advertisements appear or were to appear.

Are you familiar with that particular advertising program by General Dynamics?

A Yes, sir, I am.

Q There is an ad in there, is there not, that does refer, if not explicitly, but by reference, to the coal operations of United Electric?

A Yes, sir.

[1921] Q Is that the ad in which there is an apple?

A Yes, sir.

Q Could you tell me, if you know, what the purpose of this advertising series was?

A To improve the corporate image.

[1922] Q Was there any intent or desire on the basis of that advertising series to try to sell coal?

A No, sir.

MR. HEDLUND: Does the Government have a copy of its Exhibit 90, and could we give it to the Judge?

MR. CUSACK: I have one. I will be happy to hand it to his Honor.

THE COURT: I don't know what—I think I know what 90 is.

MR. CUSACK: The Common Customer chart, your Honor.

MR. HEDLUND: It is the Common Customer chart, your Honor.

THE COURT: Oh, yes. If you need it, I don't need it. I will just listen.

MR. CUSACK: I will write good notes.

THE COURT: All right.

BY MR. HEDLUND:

Q Mr. Nugent, I hand you what has been received in evidence as Government Exhibit 90 which is a chart entitled "Common Known Customers of United Electric Coal Companies and Freeman Coal Mining Corporation," showing destination points, 1967.

MR. HEDLUND: Your Honor, may I stand by the witness so that I may look onto the document?

[1923] THE COURT: You may.

You may stand, too.

MR. CUSACK: Thank you, your Honor.

BY MR. HEDLUND:

Q Mr. Nugent, directing your attention to the sales in 1967 from the Crown Mine to Caterpillar Tractor Company at its plant in Decatur and from the Cuba, Buckheart Mines to the East Peoria and Montgomery plants of Caterpillar, my question is, would those sales have been competitive or in competition with each other in that year had the two companies been independent?

A No, sir, they would not have been competitive.

Q Could you explain why?

A The coal as shipped to the Decatur plant from the Crown mine is transported by truck. It is a short haul, and service is available 7 days a week. This is a particular advantage. Of course, that could not be done from the Cuba Mine.

Q What about the shipments to East Peoria and Montgomery, could the Crown Mine have competitively reached—

A No, sir. The rate would not be competitive. The freight rate would not be competitive.

Q Directing your attention to the shipments in [1924] 1967 from the Cuba, Buckheart Mines to the Peoria facilities of Central Illinois Light Company and the tonnage shown without regard to mine but tonnage from Freeman to the Springfield plant of Central Illinois Light Company, had the two companies been independent, would those shipments have been competitive?

A Again, the coal from the Crown Mine to the Springfield plant of Central Illinois Light Company was supplied by truck. The freight rate from the Crown Mine or Springfield area to the Peoria market would not be competitive.

Q With respect to the shipments in 1967 from the Crown Mine to the Meredosia plant of Central Illinois Public Service and from the Cuba, Buckheart, Banner Mines of United Electric to the same plant of Central Illinois Public Service, had the two companies been independent, would those shipments have been in competition with each other?

MR. CUSACK: Your Honor, I have to interject an objection at this time. Mr. Morris during his direct examination and cross examination went into this most fully. I think it was at least a half a day. I think this is repetitive. I think the testimony is identical to Mr. Morris'.

[1925] On that basis, I object.

MR. HEDLUND: Well, I asked Mr. Morris these questions for 1965 and 1966.

Would the Government stipulate that if I go through with Mr. Nugent on similar questions, that his answers for 1967 would be the same?

MR. CUSACK: I believe they would be.

MR. HEDLUND: You will so stipulate?

MR. CUSACK: Yes.

THE COURT: All right. Let the record so show, then.

BY MR. HEDLUND:

Q Just to add one last item with respect to these shipments as discussed by Mr. Morris and as would have been discussed by you pursuant to the stipulation, what percent of the total production of Freeman Coal Mining Corporation is represented by dust?

A Oh, 10 to 11 percent, I would say.

[1926] Q Mr. Nugent, I hand you what has been received in evidence as Defendants' Exhibit 63 which is a chart entitled "The United Electric Coal Companies Committed and Uncommitted Reserves by Mines."

If you will look down about the middle of the page and under the mine heading "Fidelity," there is an item that reads, "Tonnage Committed to Current Negotiations, 10,700,000 Tons." Under the remarks column, it is Northern States Power, Union Electric and NIPSCO.

Has a contract been signed by Northern States Power and United Electric?

A Yes, there has been.

Q Do you know what the term of that contract is?

A It is a ten-year contract with a back-up by Freeman.

Q Do you know the approximate yearly tonnage?

A I think it is about 450,000 to 500,000 tons, in that neighborhood.

Q Has a contract been signed between United Electric and Union Electric?

A No. There is one in the draft stage.

Q Other than the committing to paper of the terms of that contract, in effect, is that contract now [1927] operable?

A Well, I think we are in agreement. It is just a question of some minor details on language.

Q Do you know what the term of that contract is?

A That was a ten-year contract, I believe.

Q Does that contract also have a back-up guarantee by Freeman?

A Yes, sir, it does.

Q Do you know approximately the tonnage?

A I think that, too, was in the neighborhood of 400,000 to 500,000 tons.

Q Could it be 350,000 tons per year?

A It could well be.

Q Has a contract been signed between United Electric and NIPSCO?

A That, too, is in the draft stage.

Q Has an agreement been reached on its essential terms?

A Yes, it has.

Q What is the duration of that contract?

A I think that is four years with an option for one more on the part of the buyer.

Q Approximately what is the annual tonnage on that contract?

[1928] A I think it is about the same.

Q Freeman Coal Mining Corporation has in the past sold coal to the American Maize Products Company, has it not?

A Yes, sir.

Q Is that in Roby, Indiana?

A Yes, sir.

Q It is in the northwest portion of the state?

A Yes, sir.

Q Are you still selling coal to American Maize Products?

A No, sir.

Q Why is that?

A The plant has gone to gas.

Q In the past, has the United Electric Coal Companies sold coal to the Sanitary District of Chicago?

A Yes, sir.

Q Are they doing so at the present time?

A No, sir.

Q Why is that?

A The plant has gone to gas.

Q Mr. Nugent, are you familiar with the Keystone Coal Buyer's Manual?

A Yes, sir.

[1929] Q Could you generally describe what the function of that manual is and who it is sent to?

A Oh, it is a reference book published by McGraw-Hill of practically all of the coal mines in the United States. It goes into some detail.

Q Does it also list the names of people who buy coal?

A Yes, sir.

Q Does it carry advertising?

A Yes, sir.

[1930] Q Are you familiar with the fact that from time to time in the Keystone Coal Buyer's Manual's descriptions of particular mines that estimates are provided of the life expectancy of a particular mine?

A Yes, sir.

Q Could you tell me what validity and what purpose such estimates have?

A Well, I think not too great. Smaller operators and most operators with limited reserves are reluctant to lay before the public the nature of their reserves. I think most of them like to use the word "indefinite."

It isn't of any great value because the utility buyers are much too sophisticated to accept that type of information.

Q Would a utility rely upon that at all?

A Not at all.

Q Would it surprise you to know that the 1963 Coal Buyer's Manual contained an estimate on the life of the Mary Moore Mine in 1963, the Mary Moore Mine of United Electric, of 10 years?

A No, it wouldn't.

Q When did that mine close?

A Oh, I guess maybe five years ago or thereabouts.

Q Would it surprise you that in the 1967 edition [1931] of the Keystone Coal Buyer's Manual, that the life expectancy of the Little Dog Mine is given as 25 years?

A No, sir, it wouldn't surprise me.

Q Did that mine close last year?

A Yes. I think it went bankrupt a year or so ago.

Q Mr. Nugent, do you recall the solicitation for bids by Union Electric Company with respect to its Labadie 3 and 4 units?

A Yes, sir.

Q Do you recall approximately when that was?

A Oh, a year or so ago, two years ago perhaps.

Q Do you recall what they were asking for in terms of duration of the contract and annual tonnage?

A 20 years, I believe, and I think the tonnage was in the neighborhood of about 3 million tons.

Q That would be a total then of 60 million tons?

A Yes, sir.

Q Was United Electric in any position to be able to bid on that contract?

A No, sir.

Q Are you familiar with the solicitation for bids by Union Electric for its Sioux Units 1 and 2?

A Yes, sir.

[1932] Q Could you tell me what they were asking for on those contracts with respect to duration of contract and tonnage involved?

A I think that was 1,500,000 tons for a 20-year period.

MR. CUSACK: Would you please fix the date—

BY THE WITNESS:

A It may have been—

THE COURT: Just one moment.

Yes?

MR. CUSACK: Excuse me. Would you please fix the date on these negotiations for purposes of the record.

[1933] MR. HEDLUND: For Sioux 1 and 2? I believe I have done that for Labadie 3 and 4.

BY MR. HEDLUND:

Q Sioux 1 and 2—when were those solicitations, if you recall?

A Well, I would have to guess, Mr. Hedlund. Probably five years ago.

MR. CUSACK: I object and move to strike on the grounds of guessing. Speculation.

THE COURT: Well, his best estimate. Let's not get technical. We will be here for another two weeks.

MR. CUSACK: Withdraw the objection, your Honor.

THE COURT: All right.

BY MR. HEDLUND:

Q I am sorry, sir, but what was the tonnage and the length of contract?

A 1.5 million tons and I think it was a 10-year contract with perhaps an option for another 10, and that for the purpose of negotiating price at the end of the 10 years.

Q Was United Electric in any position to bid on that contract?

A No, sir.

Q Mr. Nugent, we had some testimony here yester-
[1934] day with respect to the estimates on owning and operating costs of Combustion Engineering's SO_2 device; which the witness, I believe, testified that 90 cents per ton was a reasonable estimate of that cost. Would you tell me whether that would be a significant or insignificant factor in coal's ability to compete?

A Oh, yes, a very significant factor. With the development of nuclear power, that could well be enough to exclude coal.

Q Are you familiar, Mr. Nugent, with the loans made by United Electric to General Dynamics in the fall of 1966?

A Yes.

THE COURT: Will this be extensive?

MR. HEDLUND: I will not conclude with him—

THE COURT: All right. I suggest then we recess until 2:00 o'clock.

(Whereupon, at 12:25 o'clock p.m., the hearing in the above-entitled matter was recessed to 2:00 o'clock, p.m., the same day and date.)

* * * *

[1936]

AFTERNOON SESSION 2:20 P.M.

* * * *

FRANK NUGENT,

called as a witness by the defendants herein, having been previously duly sworn, resumed the stand and testified further as follows:

DIRECT EXAMINATION

(continued)

BY MR. HEDLUND:

Q Mr. Nugent, are you familiar with the loans made by United Electric in the late fall of 1966 to General Dynamics?

A Yes.

Q Do you recall whether or not those loans were repaid?

A Yes, sir, they were.

Q Do you recall the interest which those loans bore?

A I don't recall the rate, other than it was higher than we were receiving on the certificates of [1937] deposit that we had been purchasing.

Q Was the money that you had in certificates of deposit—were those redeemed and used for this loan?

A Yes, sir.

Q Mr. Nugent, following the merger of the old United Electric into the new United Electric and upon its becoming a 100 percent, or rather a wholly owned subsidiary of General Dynamics, from that point to this very day were there any capital expenditure requests sent by United Electric to New York for approval that were denied or modified in any extent?

A No, sir.

[1938] Q Were such expenditure requests in fact forwarded to New York?

A Yes, they were.

MR. HEDLUND: Does the Government have Maguire Deposition Exhibit 47?

Your Honor may still have retained a copy of this exhibit as one of those that was claimed to be privileged.

THE COURT: They are in my chambers some place.

BY MR. HEDLUND:

Q Mr. Nugent, I show you what has been received in evidence as Maguire Deposition Exhibit 47, which is a memorandum dated November 1, 1966, from Mr. A. R. Finberg to H. K. Pedersen, the subject of the memorandum being the UEC tender offer.

Have you seen this document before, Mr. Nugent?

A Yes, sir.

Q Directing your attention to the second page of this document, the last sentence of this memorandum says:

> "NB: The funds referred to in this paragraph are to come to the bank not from General Dynamics but from the United Electric Coal Companies which

will be the new name of UEC Corporation as of November 7."

[1939] Can you tell me, Mr. Nugent, if you know, why those funds were to come from United Electric rather than from General Dynamics?

A That was for stock that was purchased after the tender offer expired, and that was an obligation of the new UEC Company.

MR. CUSACK: I move to strike on the ground the witness has given a legal conclusion. He is not competent to so testify.

THE COURT: Motion denied.

[1940] BY MR. HEDLUND:

Q Mr. Nugent, I wish to recall your attention to the board of directors meeting of United Electric Coal Companies of May 12, 1961, where the minutes reflect as follows:

> "Mr. Hepburn was invited into the meeting, and he and Mr. Nugent made a report on the company's stripping reserves, using maps of Fulton County and Perry County, and showing the company's reserve areas in relation to the reserve areas of other strip companies. It has been determined that the present reserves provide tonnage for continuing and growing production for about 15 to 20 years. After discussion upon motion duly made by Mr. Nugent and duly seconded by Mr. Thorson, it was unanimously resolved that the proper officers of this company, for and on its behalf, be and they are hereby authorized and directed to begin at once an aggressive program to option for purchase and/or lease areas for test drilling in the North Canton and South Buckheart areas in Fulton County and in the area in Perry County and Jackson [1941] County immediately south of the property acquired from Union Collier Company."

My question, Mr. Nugent, is, in light of that and from the time that you came on the board of United Electric

and continuing on to the present time, has United Electric made a vigorous and strenuous effort to acquire adddditional economically mineable strip coal reserves in Illinois?

A Yes, sir.

MR. CUSACK: Your Honor, the Government objects. The witness—he read from board of directors minutes that refer to the North Canton Field, the South Buckheart Field and the area at the Fidelity Mine. I think that if he is going to predicate his question on that minute, he must confine his questioning to the statement regarding those fields.

There is nothing in that minute that indicates a vigorous search for coal reserves in the State of Illinois.

THE COURT: All right. Restrict it to that, with the right to ask any question.

[1942] BY MR. HEDLUND:

Q Were the reserve activities of United Electric confined to those areas that I just read to you from the minutes of the May 1961 meeting?

A No, sir, they were not.

Q Mr. Nugent, did you or anybody else connected with United Electric that was at the same time connected with Material Service or Freeman or General Dynamics at any time from 1959 to the present time hold United Electric back in the acquisition of additional economically mineable strip reserves in the State of Illinois?

A No, sir.

Q Are you absolutely certain of that?

A Yes, sir, I am.

Q There has been a considerable amount of evidence in the record, Mr. Nugent, relating to communications and conversations between United Electric personnel and yourself or others at Freeman regarding underground mining possibilities that had come to the attention of United Electric.

With respect to any and all of those, was it ever your intention that if those opportunities proved to be economically feasible, that the profit from those operations

would adhere to Freeman rather than to United [1943] Electric?

A No, sir.

Q In point of fact, did Freeman ever take title to as much as one ton of deep coal that had been brought to its attention by United Electric?

A No, sir.

Q Mr. Nugent, there has been some testimony with respect to a probable or possible or rumored development of a strip mine down near Mt. Vernon, Illinois. Do you know anything about that?

A Yes, sir.

Q Could you tell me, sir, what information you do have with respect to that?

A Well, the TVA, we understand, or rather I understand, has a proposal for the development of what is known as the Belle Rive acreage which is directly east of our No. 6 Mine in southern Illinois. That is tied in with a proposal to develop Alabama acreage.

The Alabama acreage is, I understand, nonunion. The Belle Rive acreage, of course, is yet to be determined.

It would be most unlikely that an entity operating in a non-union operation in Alabama would be operating a union operation in Illinois, and it would be [1944] most difficult to operate a non-union operation in Illinois in close proximity to large mines such as Orient No. 3 and Orient No. 6, owned by the Freeman Coal Mining Corporation.

[1945] Q What is your understanding as to the sulphur content of the coal with respect to the Alabama acreage?

A The Alabama acreage is extremely low in sulphur, much under 1 percent.

Q Much under 1 percent?

A Yes.

Q Do you know whether this proposal is on a both or on an either/or basis?

A They must take both.

Q Mr. Nugent, there has been a considerable amount of testimony in this case and evidence in this case, as recently as this morning, with respect to the so-called Industry Field of United Electric. I know that you have

testified on your deposition with respect to it, but I have one final question.

Since your deposition, so the evidence seems to indicate, coal prices have gone up, there have been some at least temporary shortages of coal, and we have heard other testimony with respect to nuclear energy and the availability of gas, and we have heard some testimony with respect to SO_2 devices.

Q The first question is: Have you had a recent opportunity to look at the actual operating results of the Banner Mine?

A Yes, sir.

[1946] Q You were present, were you not, in the courtroom this morning when Mr. Hopper testified?

A Yes, sir.

Q Based upon your experience of 50 years in the coal industry and your professional judgment, is the Industry Field of United Electric an economically mineable strip field?

A No, sir, it is not. There was a time in the early part of 1960 when I suggested that land be acquired at farm prices, that I felt perhaps this coal might be mined after all of the coal in the Fulton County is exhausted, and that could be some 20 years hence.

United Electric has about a million dollars invested in the Industry Field. With the further development of nuclear energy, my present thinking is that the Industry Field will probably never be mined and that the company had better take its licking now and dispose of the land, at farm prices if need be.

MR. HEDLUND: Thank you, Mr. Nugent. That is all I have, your Honor.

THE COURT: Do you want a short recess before you commence your cross examination?

MR. CUSACK: No, your Honor. I am fairly well prepared up to some of the more recent material.

* * * *

[1975] CROSS EXAMINATION

* * * *

BY MR. CUSACK:

Q Yes, sir.

A Are you asking me if that is in the 1965 report?

Q Yes, sir.

A No, it is not, in language.

Q Thank you, sir. You testified, Mr. Nugent, in regard to Freeman backing up the coal contracts entered into by United Electric, is that correct, sir?

A Yes, sir.

Q Now could you please explain to the Court, sir, if United Electric and Freeman are not in competition or are not competitors for the sale of coal, how Freeman can act as a back-up for the coal sales of United Electric?

A I think I can. I have a very strong feeling that we are in a temporary bullish market on coal, and we have made a diligent effort to put all of United Electric's remaining reserves under cover. We have contracted for nearly all of the coal that United Electric will produce for the remaining life of its mines.

Now, I feel strongly within the next few years when nuclear power comes into being—and this is further supported by Mr. Corey's testimony of a day or two ago, or yesterday I believe it was—that when that [1976] nuclear power is turned on, this market will not be as it is today, and United Electric needs to have its coal under contract, because it will be near the end of the line. In order to accomplish that, we backed it up with Freeman tonnage, and that is the only way the coal could have been sold.

Q Is it fair to say that General Dynamics is trying to sell United Electric's coal as fast as possible?

A I haven't discussed it with General Dynamics. I consider myself to be an expert on the sale of coal.

Now, it is my opinion, and I haven't needed to take it up with General Dynamics, that that is what should be done in the orderly conduct of United Electric's affairs.

Q Of the 8 million tons of coal produced by Freeman in 1969, approximately what percentage of it was sold to public utility companies?

A About 72 percent.

Q How much of the coal was sold, approximately what percentage, to steel companies for metallurgical purposes?

A 8 percent.

Q And would the remainder be sales to industrial [1977] users?

A General industrial users.

Q Approximately what percentage of the coal produced by United Electric in 1969 was sold to utilities?

A Perhaps a little higher than that.

Q About 75 percent?

A Maybe about that range.

Q Would the remainder of that coal be sold, then, to general industrial users?

A Yes, sir.

Q You testified this afternoon regarding the loans made by United Electric to General Dynamics. Do you recall that?

A Yes, sir.

Q These loans were repaid, sir, after United Electric was merged into General Dynamics, is that correct?

A Yes, sir.

[1978] MR. HEDLUND: I am going to object, your Honor, to the characterization. This has been done before, and I think the record should show. United Electric was not merged into General Dynamics. United Electric was merged into United Electric. It remains a 100 percent subsidiary.

THE COURT: Do you accept that statement for the purpose of the question?

MR. CUSACK: Yes. I submit it is a bit of a quibble.

THE COURT: All right. Let's proceed.

Are you ready to answer?

THE WITNESS: Do I have a question?

THE COURT: Yes.

MR. CUSACK: I believe he answered it.

THE COURT: Did he answer it? All right. Proceed.

BY MR. CUSACK:

Q Sir, this repayment of the $2 million loan of United Electric to General Dynamics—

A Yes, sir.

Q —was this before or after United Electric declared the $6 million dividend payable to General Dynamics?

A If you are dealing in days, I don't know. It could be a day or two after or a day before. I don't recall.

[1979] Q It was in that period, though, was it not?

A Yes. This was an ordinary banking function. It was handled by our treasurer.

Q Was it a wire transfer of funds?

A Yes. All of our funds are handled in New York on a daily basis. Our funds are transferred to New York. We draw on New York each day. This eliminates the necessity for carrying balances in hundreds of banks throughout the country. All divisions pool their funds in New York.

Q In regard to the capital appropriation requests of United Electric, isn't it true that you would have to approve of these capital appropriation requests prior to their being sent to New York?

A Yes, sir.

MR. CUSACK: Your Honor, may I borrow back Maguire Deposition Exhibit 47?

BY MR. CUSACK:

Q Mr. Nugent, I hand you Government Exhibit Maguire Deposition Exhibit 47. I ask you, sir, to examine page 2 of that exhibit, the last full paragraph. Have you finished reading it?

A Yes, sir.

Q Isn't it true that in 1966 $2,672,207 of United Electric's funds were used to pay for the General [1980] Dynamics tender offer for the shares of United Electric?

A I don't think that is true. My recollection is that United Electric after the tender offer had expired spent $1,300,000 for further acquisition of United Electric's stock.

MR. CUSACK: May I have a moment, please, your Honor?

THE COURT: You may.

(There was a short interruption, after which the following further proceedings were had herein, to-wit:)

BY MR. CUSACK:

Q You testified, sir, regarding the Belle Rive property at Mt. Vernon.

A Yes, sir.

Q This property is being developed by Merle Kelce, is that correct?

A Well, I don't know that that is entirely correct. He may have a partner.

Q On what testimony or on what evidence do you base your testimony regarding the Belle Rive property?

A On a conversation with TVA. This is not a public offer. This is a negotiated deal, and the deal has not been made public as yet. When it is concluded, [1981] it will be made public. In the meantime, there is a lot of gossip on the street, which apparently you have picked up. That acreage was first called to United Electric's attention in 1928. We went into it again in 1964. In 1964, Mr. Young, who at that time owned the property and who owns it presently, then represented that he had 5 million tons.

Now, some of the gossip on the street doesn't quite fit the facts as they were presented to us by Mr. Young. [1982] Q How many tons are in the field now, if you know?

A Present rumor is 17 million. It has grown from 5 million to 17 million, and the seam of the coal is one foot eleven inches.

Q What is the overburden?

A It is pretty high. I have forgotten.

Q Isn't it over 75 feet?

A It is over 75 feet, and the quality of the coal has not been definitely determined. The sulphur content varies from 2 percent to 5 percent. We don't know which it is.

Q Is it No. 5 or No. 6 coal?

A It is a bastard seam coal. It has no characterization.

Q In regard to the Industry Field, isn't it a fact that Mr. Hepburn of United Electric believed that the Industry Field would after the exhaustion of the Fulton County strip coal reserves be an economically profitable operation?

MR. HEDLUND: I am going to object, unless Mr. Cusack clarifies his question. Are you talking about all, everybody's Fulton County reserves, all reserves of Fulton County, or United Electric's?

MR. CUSACK: United Electric's.

[1983] THE WITNESS: May I have the question?

THE COURT: Rephrase the question.

BY MR. CUSACK:

Q Isn't it a fact, sir, that Mr. Robert Hepburn of United Electric believed that when United Electric's Fulton County coal reserves were exhausted, the Industry Field could be developed into an economically mineable strip mine?

A Well, I don't know what Mr. Hepburn believed, but whatever he believed, I would not be willing to accept his judgment. He had absolutely no knowledge in the market, nor did Mr. Kolbe. That was the problem with the Industry Field. The field was purchased by people who knew nothing about markets. They had no conception of what they were going to do with the coal after they bought it. That is why they spent a million dollars of the company's money and wasted it.

Q But you testified, had you not, that United Electric was a highly profitable company? Wouldn't that indicate it to you that its management knew something about markets?

A Not at all. Mr. Kolbe frequently had said that he knew nothing about markets, that he depended entirely upon Johnny Morris, that Johnny was a good salesman. I [1984] agreed with that in total. I don't know a better salesman than Mr. Morris. But he was not consulted when the Industry Field was acquired. Had they consulted him, the million dollars would not be down the drain.

Q Isn't it a fact that Mr. Morris—

A Let me say further that the Industry Field is nothing other than a red herring. When we moved into United Electric, I found this asset on the books, of questionable value. Let's assume the management made a mistake. We don't criticize management for the mistake. We criticize managment for trying to defend the mistake.

[1985] Q Isn't it a fact, sir, that Mr. Morris, while he was a director of United Electric, approved the acquisition of coal reserves at the Industry Field?

A I think not.

Q Isn't it a fact that while you were a director of United Electric you approved the acquisition of coal reserves at Industry Field?

A I did, at farmland prices, on the basis that it was worth no more than that.

Q If it was worth no more than that, why didn't you dispose of it?

A Why didn't we dispose of it? We can't find anybody foolish enough to buy it.

Q Have you ever tried?

A Yes. I would hate, I just wouldn't have the guts to offer the Industry Field to anybody in the coal business. It would be an insult to one's intelligence.

Let me give you an example, if I may—

THE COURT: I think you have answered the question.

MR. CUSACK: May I have five minutes, your Honor? Can we take our break now? I think I can finish up in about 10 minutes with everything.

THE COURT: All right. A five-minute recess.

(There was a short recess, after which the following further proceedings were had herein, to-wit:)

* * * *

[1987] THE COURT: Yes.

MR. HEDLUND: The witness certainly did not testify with respect to the competition between these two companies in 1955 to 1959.

MR. CUSACK: Well, would you stipulate that United Electric and Freeman were in competition from 1955 to 1959? Then we can shorten this.

MR. HEDLUND: With respect to some accounts, I think that may have been true. The Buffalo Creek Mine was operating in that time. We have already heard testimony from TVA on this.

THE COURT: Well, do you stipulate to Mr. Cusack's statement or not?

MR. HEDLUND: If he wants to reframe it, I may. Not generally, no I won't stipulate.

THE COURT: Well, then the Court will rule on the question that there has been testimony both from this witness and Mr. Morris that they were not in competition.

He may answer. You may proceed.

BY THE WITNESS:

A The question was, did I discuss prices of Freeman coal and United Electric's coal during that period of time?

BY MR. CUSACK:

Q With Mr. Morris.

[1988] A With Mr. Morris, I can't say that I went back as far as 1954, but during that period, I discussed prices of United Electric coal. The prices Freeman coal were of no concern to Mr. Morris. I was policing the United Electric Sales. Mr. Morris was not policing Freeman sales.

Q Because during this period of time you controlled United Electric?

A We had a substantial stock interest.

Q Please answer by question.

THE COURT: Read the question.

(Question read by the reporter.)

BY THE WITNESS:

A If "control" mean 51 percent of the stock, no we did not. We had four members of a 9-member board in 1959.

BY MR. CUSACK:

Q Prior to 1959, did you consider that you controlled United Electric?

A No, sir.

* * * *

[1994] BY MR. CUSACK:

Q Is it over $4.25 a ton?

A Oh, yes.

Q Is it fair to say, Mr. Nugent, and I am not trying to pin you down—would it be in a range from $4.25 to $4.50 per ton?

A It would be a little higher than $4.50. If you want me to make an estimate, I would say it is in the neighborhood of $5.50 a ton.

Q At the Banner dock?

A Yes, sir.

Q Could you tell us, sir, what the average mine price per ton of coal for the Buckheart and Cuba coal is at the Buckheart-Cuba dock?

A Well, coal is sold on a cost per million basis, as delivered.

Now, Banner coal washed will do about 12,000 BTU per pound as received. Cuba coal will do about 10,600 BTU as delivered. So for all practical purposes at a delivered point they are the same.

Now, the difference between 10,600 and 12,000 is—what? Fourteen hundred BTU? Each hundred BTU is worth about 4 cents. That is the difference between the two coals.

[1995] Q Your answer would be the same in regard to Fidelity in 1969?

A Yes, sir.

Q And there has been an advance, has there not—

A Did you say Fidelity?

Q Yes.

A No. Fidelity relates to the Belleville District field.

Q You say the price is different?

A The price in the Belleville District field, because of the difference in transportation, of course, is different.

Q I am talking about f.o.b. mine.

A The f.o.b. mine price, yes, it would be different than Banner. There is no relation between the Belleville field and the Fulton County field. There is a relation between mines in the Fulton County field.

Q In the Fidelity coal at the Belleville, the Belleville District would be based on per million BTU, is that right?

A That's right. The competition is on that basis.

Q I would now like to discuss with you Defendants' Exhibit 63.

Would you please look at Defendants' [1996] Exhibit 63. Do you anticipate, sir, that any of this coal set out on this schedule will not be consumed because of high sulphur characteristics of the coal?

A Well, that is difficult to answer. If they don't consume it, I don't know what they are going to generate power with. Many of these people that are generating power, there isn't any low sulphur coal available. There isn't any low sulphur oil available. Gas is scarce. I would have to assume that some way is going to be found to provide for these people to burn high sulphur coal to generate power.

* * * *

[1999] MR. CUSACK: Could you hand Mr. Nugent a copy of [2000] Defendants' Exhibit 228, please. I know you have one for the Court. You used it on direct.

MR. HEDLUND: I am not arguing with you, Mr. Cusack. I am looking for the document.

MR. CUSACK: I think it may expedite it if I just go over it with the witness.

THE COURT: All right.

MR. HEDLUND: It is Exhibit 229.

MR. CUSACK. I am sorry.

MR. HEDLUND: You need a copy, do you, for the witness, Mr. Cusack?

MR. CUSACK: Yes, please.

MR. HEDLUND: (Handing document to witness.)

BY MR. CUSACK:

Q Mr. Nugent, directing your attention DX-229, the first page, it states that the estimated deep tonnage of the Crown mine is 20,719,000 tons.

A Yes, sir.

Q Is that all high sulphur coal, sir?

A Yes, sir.

Q Orient No. 3 estimated deep tonnage of 33,532,000 tons. Approximately what percentage of that is under

2.5 percent sulphur and what percentage is over 2.5 percent sulphur?

[2001] A All of Orient No. 3 is under 2.5 percent in sulphur.

Q Of the 33,532,000 tons at Orient No. 3, approximately what percentage of those reserves, as set out on the first page of this exhibit, are under 1.5 percent sulphur?

A It is all about at 1.5 percent.

Q In that range?

A 1.4 to 1.5.

Q In regard to Orient No. 4, reserves of 5,315,000 tons, is that high sulphur or low sulphur coal?

A Below 2.5 percent sulphur.

Q Is it above 2 percent?

A In that range.

Q Between 2 to 2.5?

A Yes, sir.

Q Orient No. 5, reserves of 34,035,000, sir, is that high sulphur or low sulphur coal?

A All high sulphur.

Q Above 3.5 percent?

A Yes, sir.

* * * *

[2005]

REDIRECT EXAMINATION

BY MR. HEDLUND:

* * * *

Q Isn't it true that these acquisitions were in the form of an intra-corporate transfer of assets?

A Yes, sir, they were.

Q You referred to the purchase of the Erwin stock. Was that a stock held by J. Erwin Miller?

A Yes, sir.

Q He was a member of the board of United Electric, was he?

A He was at an earlier date, but not, I think, at that time. I am not sure about that, though.

Q With respect to the Defendants' Exhibit 63 on the

committed and uncommitted reserves of United Electric, there is an indication on here that United Electric has a contract with Commonwealth Edison which terminates December 31, 1970.

A Yes, sir.

Q Isn't it true that that portion of the tonnage shipped after July 1st of this year will not be burned in Chicago?

A Commonwealth Edison have so assured us.

Q Isn't it true that any of the other tonnages shown on this schedule that are prohibited from being burned by virtue of local, state or national ordinance, will not be burned at those plants for which this tonnage [2006] had been arranged?

A Yes, sir, that is true.

MR. HEDLUND: I think that is all I have, your Honor.

[2012]

IN THE UNITED STATES DISTRICT COURT
NORTHERN DISTRICT OF ILLINOIS
EASTERN DIVISION

No. 67 C 1632

UNITED STATES OF AMERICA, PLAINTIFF

vs.

GENERAL DYNAMICS CORPORATION; THE UNITED ELECTRIC COAL COMPANIES; and FREEMAN COAL MINING CORPORATION, DEFENDANTS

Before HON. EDWIN A. ROBSON, Judge,
Friday, April 17, 1970,
10:30 o'clock a.m.

PRESENT:

MR. JOHN THOMAS CUSACK,
MR. ROBERT L. EISEN,
MR. RONALD L. FUTTERMAN,
MR. HUGO SIMS, and
MR. RICHARD J. BRAUN,
MR. JOHN SARBAUGH,
appeared for Plaintiff;

MR. HAMMOND E. CHAFFETZ,
MR. REUBEN L. HEDLUND,
MR. DONALD G. KEMPF, JR., and
MR. RICHARD H. IRVING, III,
MR. SAMUEL HAUBOLD,
appeared for Defendants.

ALSO PRESENT:

MR. CHARLES BANE,
MR. JAMES M. FOLSOM.

• • • •

[2034]

THOMAS L. CRAIG

DIRECT EXAMINATION

BY MR. EISEN:

Q State your name, please, and your address.

A Thomas L. Craig, 506 Lake Elbert Drive, Winterhaven, Florida.

THE COURT: Will you spell your last name, Mr. Craig?

THE WITNESS: C-r-a-i-g.

THE COURT: All right, the common way.

BY MR. EISEN:

Q By whom are you employed?

A I'm employed by Wellman-Lord, Incorporated.

Q For how long have you been with Wellman-Lord?

A Just over two years.

[2035] Q What is your position at Wellman-Lord, Incorporated?

A I'm manager of pollution control.

Q Could you very briefly state your background, your education and work experience.

A I'm a graduate chemical engineer, 1949. I worked for two years for Shell Oil Company as a technologist in Montreal, Canada. I spent, then, 10 years in various production positions with U. S. Industrial Chemicals in Tuscola, Illinois. I then spent two years with Commonwealth Oil Refining Company of Puerto Rico in their New York office, all of which jobs were in the manufacturing end of the business, or the technical manufacturing end of the business.

I then rejoined United States Industrial Chemicals for a year, and following that I worked for two and a half years for International Minerals and Chemical Company out of Skokie, following which I went into business for myself, and then joined Wellman-Lord.

Q What is the business generally of Wellman-Lord, Incorporated?

A Wellman-Lord is an engineering construction company to the fertilizer chemicals and industrial chemicals industries generally.

[2036] Q Could you explain generally what your duties are with respect to air pollution control.

A Well, I am, as I said, manager of pollution control for Wellman-Lord, and it's a staff position in that I am responsible for the administration of nearly all of our activities in the field of air pollution control. I, for a better term, advise and consent on our technical programs; I supply sales support for our Marketing Department; I do or have done for me economic and technical feasibility studies, for ourselves and for clients as they require it.

Q In the course of your duties, have you become familiar with the research and development of processes designed to remove or recover sulphur oxide emissions from stack gases?

A Yes.

Q Could you tell us briefly what the history of that activity has been.

A Excuse me. Our activity, or generally?

Q Generally.

A Well, over the past five years particularly there has been a number of organizations developing or researching and commercializing processes for the recovery of sulphur oxides, particularly sulphur dioxide, from [2037] stack gases. It started, I would say, about 1966 really in intensity, and the over-all activity has increased rather dramatically since then.

Q Could you give us the reasons for that increase.

A The statutes country-wide on SO_2 levels in the atmosphere have been made just drastically more stringent, let's say, than they had been, and where they have not been made more stringent, let's say, the enforcement of older statutes which had hitherto not been given the time of day, are certainly being pressed more actively.

Q Could you name the companies and organizations which you consider the major institutions or companies engaged in developing and perfecting these devices today?

A Well, I'll start off with Wellman-Lord, and then

there are a number of companies, plus agencies. We have Monsanto, CHEMICO, Combustion Engineering, Universal Oil Products, Consolidation Oil—I am sorry—Consolidation Coal Company, I believe, the Division of Continental Oil, in the United States.

[2038] Q ESSO Research also, or did you mention that?

A No. ESSO Research has announced that they are active in this field.

Q Where is the Universal Oil Products installation, if any? Do they have an installation?

A No, they don't. They have announced an installation.

Q Where is that to be located?

A It's going to be in the greater Chicago area somewhere, and I'm not sure as to the exact location.

Q At a Commonwealth Edison generating station?

A I believe so.

Q Do you know who James R. Garvey is?

A Yes. He's with one of the agencies of the National Coal Association. He's a technical director or—he's got an executive position with one of the coal associations.

Q I would like to read to you, Mr. Garvey—

THE COURT: Craig.

BY MR. EISEN:

Q Mr. Craig. I'm sorry.

I would like to ask you a question, that is, about a statement made by Mr. Garvey to the Joint [2039] Committee on Atomic Energy of the United States Congress, which is contained in Government Exhibit No. 272:

> (Reading) "During the past 10 years I have on numerous occasions appeared before committees of Congress and other governmental agencies to testify on the 'state of the art' of control of sulphur oxides. At one such appearance before the New Jersey State Department of Health on October 6, 1967, I said: 'With all the activity by various research organizations, we are confident that an economically attractive approach for the recovery of sulphur oxides from flue gases will be available in the next three years,

give or take a year.' The purpose of my testimony here today is to bring to your attention the fact that this prediction of about two and one-half years ago was correct."

Would you agree with Mr. Garvey's statement as to—

THE COURT: Just a minute. Is there an objection?

MR. HAUBOLD: Yes, there is, your Honor. I would object on the ground that this is highly leading. I am not sure who is testifying, Mr. Eisen or Mr. Garvey, [2040] and we would object on the basis that it is leading.

We would also like to point out that this exhibit was just handed to us shortly before the session began this morning, and not within the 24-hour period. I do not believe this has been received in evidence.

THE COURT: Is it in evidence or not?

MR. EISEN: I do not know if it is in evidence. We supplied the defendants with a copy of this. I do not know whether I mentioned the date of the document. It is February 25, 1970. When copies of the speech were distributed, we supplied the defendants with copies, telling them that we intended to introduce the document. I have not offered the document.

THE COURT: When was that?

MR. EISEN: We intend to offer it in our rebuttal case, and I think we so indicated to the defense. I know we had indicated it to the defendants.

MR. HEDLUND: Yes. That is true, your Honor, but in terms of the 24-hour rule in using documents with a witness, that has not been abided by.

Secondly, if that document was to go into the rebuttal case, it was to go in as a third-party publication, if you will, and not as a document to be used to examine witnesses on.

[2041] THE COURT: I did not hear the latter part of your statement.

MR. HEDLUND: And not to be used as an exhibit to examine witnesses on.

MR. EISEN: I do not understand, your Honor. I was just going to ask him to state whether or not in his opinion that was an accurate prediction, or if he agreed with that statement.

MR. HAUBOLD: Your Honor, it would seem to me that he can ask Mr. Craig for his opinion in various areas, but I think it is improper on direct examination to quote at length an opinion by some third party and then ask the witness whether he agrees with it.

THE COURT: Well, it may go in subject to the objection, so we can proceed. You will have the right to examine it.

Do you understand the question, sir?

THE WITNESS: Yes, your Honor.

THE COURT: All right.

[2042] BY THE WITNESS:

A Could I ask to have it re-read, the part where he said in how many years from 1966 or '67 he had made the statement?

BY MR. EISEN:

Q He says that:

(Reading) "This prediction of about two and one-half years ago was correct."

The statement was made February 25, 1970.

MR. HEDLUND: That is not true.

THE WITNESS: Your Honor, may I ask—really, the conversation has got me puzzled.

THE COURT: Will you restate the question.

BY MR. EISEN:

Q Mr. Garvey was quoting a statement that he had previously made on October 6, 1967 before the State of New Jersey Department of Health, where he said:

(Reading) "With all of the activity by carious research organizations, we are confident that an economically attractive approach for recovery of sulphur oxides from flue gases will be available in the next three years, give or take a year. The purpose of my testimony here today is to bring [2043] to your attention the fact that this prediction of about two and one-half years ago was correct."

My question to you was whether you agree with his statement.

A Yes.

Q He goes on to say:

(Reading) "We now have commercial processes available for use, although their economic attractiveness may not be all we desire. The added cost for sulphur oxide control may increase the cost of electricity to residential consumers by at least three and perhaps eight percent."

I would like to ask you, Mr. Craig, whether or not you agree with the cost spread of these control devices as expressed by Mr. Garvey?

MR. HAUBOLD: Your Honor, I object. I do not believe he has laid a foundation as to this witness' knowledge in the area of electrical cost to consumers.

THE COURT: Objection sustained. Lay the foundation.

BY MR. EISEN:

Q Mr. Craig, is it part of your duties to cost out the installation of air pollution control devices, particularly Wellman-Lord's, when used in conjunction [2044] with electrical generating facilities?

A Yes.

Q Would you say that, based on your knowledge and experience, that Mr. Garvey's cost spread is an accurate one?

THE WITNESS: Excuse me, your Honor. May I question counsel?

BY THE WITNESS:

A Was that the three to eight percent?

BY MR. EISEN:

Q Three to eight percent.

A Yes.

Q Are some recovery techniques designed to produce a saleable product?

A Yes.

Q Would that factor affect the increase in cost with the installation of a pollution control device?

A Yes.

Q Would you explain what factors would be involved as far as how that might affect a cost?

A Well, when we project the operating cost which, of course, follows the projection of the capital cost, we project the capital cost, then we project the operating cost for a given generating station. We come [2045] up with a gross operating cost from which we subtract a part of that gross operating cost, which reflects the credit we assign to the sale of the recovered material.

Q I do not know that you have explained as far as—When you refer to recovered material, what are you referring to?

A Well, for our particular process, it can be SO_2 gas, SO_2 liquid, sulphuric acid or sulphur.

Q Do some processes of desulphurization recover materials or chemicals such as this and others not so?

A Yes.

THE WITNESS: Your Honor, can I give a qualified answer to these questions?

THE COURT: Yes, you may qualify your answers.

[2046] BY THE WITNESS:

A (Continuing.) There are some materials recovered with some of the processes being offered which are less saleable than some others. The sulphuric acid or sulphur is a saleable material. The sulphur-laden limestone, let's say, from the TVA or—I'm sorry—the Bureau of Mines, or the Combustion Engineering process, would not be as saleable. In fact, they may not be saleable at all.

BY MR. EISEN:

Q Is it possible that with one of these recovery processes through the sale of the recovered chemical, that a utility might install such a process without any increased cost to itself?

A I cannot give you a yes or no, but I strongly doubt it.

Q If there was a chemical plant adjacent to an electrical generating station which could use the recovered

product, would this have a substantial effect on the cost, net cost to the utility?

A If the utility and chemical plant were both of a relatively large size, and I'm thinking in terms of something in the neighborhood of 600 or 700 megawatts and above, you could possibly break even.

[2047] Q So that in an instance like that, it would not be at any net cost, additional cost to the utility?

A Yes, but again I must say that this would be a rare happy marriage. It could happen.

THE COURT: Do you know of any such situation at the present time?

THE WITNESS: Again, your Honor, I'm going to have to qualify my statement. I know of some situations, but I know of them in the context of Wellman-Lord. I don't know that the utility and the chemical company would necessarily agree.

BY MR. EISEN:

Q Is there such a situation that exists in the Chicago area?

A Yes.

Q Where is that?

A I have been instructed by my counsel to refrain from answering any questions along either tachnical confidentiality or business confidentiality without first checking with them.

THE COURT: The Court directs that you answer.

MR. EISEN: Your Honor, I have to apologize. I did not intend to get into this. I will withdraw the question for now.

[2048] THE COURT: All right.

MR. EISEN: I apparently have surprised the witness with the question, so I will withdraw it for now.

MR. HAUBOLD: Your Honor, I move to strike the prior question and answer.

THE COURT: Which one, the Court's question or Mr. Eisen's question?

MR. HAUBOLD: Reluctantly, the Court's question.

THE COURT: It may stand.

BY MR. EISEN:

Q When did Wellman-Lord commence the development of its process?

A In late 1965 or 1966. We did the original literature research on the processes for SO_2 recovery from stack gases which were then available. These were primarily outside of some work which had been done by the Federal agencies of the U. S. Government. These were processes that were available in Germany and in Japan.

We investigated what was available, and it did not look like anything available was going to be attractive, so we decided to make a try at developing a novel process of our own, and put together a conceptual paper study in 1966, which was the beginning of the [2049] Wellman-Lord SO_2 recovery process.

Q Could you describe the process and what it does?

A It's a wet scrubbing regenerative process. We contact the stack gas with an absorbing solution. The absorbing solution removes the sulphur dioxide and the sulphur trioxide, the fly ash, and we then take that sulphur dioxide laden material and regenerate by using some form of energy—in our case it's steam—and drive off the concentrated sulphur dioxide from this rich material, and then return the de-enriched material back into the system to absorb the sulphur dioxide again.

So, it's a recycling, recirculating regenerative system.

[2050] Q Where has this system been used?

A We used it at a very small pilot plant at the Tampa Electric Gannon Station in Tampa, Florida. We used it at a demonstration plant at the Baltimore Gas & Electric facilities at the Crane Station of Baltimore Gas & Electric, just outside of Baltimore. And that is where we have used it.

Q When did you begin to use it at the Gannon Station? The Gannon Station is at Tampa?

A Right.

Q When was that, sir?

A We did the original work there in 1967.

Q When was it installed at the Baltimore Gas & Electric?

A We started it up early January 1969.

Q Was that on an old Baltimore Gas & Electric installation?

A The Crane Station on which we installed the demonstration plant, I think, was five or six years old.

Q Did you do that yourself, or was that in conjunction with others?

A There were seven parties involved in the founding and the operation of the plant.

Q Other corporations or municipalities? [2051] Governmental bodies?

A Would you like me to name them?

Q That won't be necessary.

A There were four utilities and three private companies.

Q What was your experience at the Baltimore Gas & Electric demonstration plant?

A We verified the chemistry. We proved out the thermodynamics, and we had a number of problems.

Q What were those?

A The biggest single problem was our energy costs that we projected we never met at Baltimore. The actual energy requirements, the steam requirement, the power requirement, was about double. That was the biggest single problem.

The second biggest problem was the inability to keep the plant line because of difficulties primarily with fly ash.

Q What have you done, if anything, to solve these problems?

A We switched from a potassium based system to a sodium based system, where we expect the energy requirements to be more in line with our original projections, and in mid-February and early March did [2052] some additional work at the Tampa Electric Gannon Station to check out a redesign of our pre-scrubber section of the plant for the removal of fly ash.

[2053] Q Do you offer your present process as a commercially feasible process to utilities?

A Yes.

Q Do you make any guarantees?

A Our guarantees are limited to the efficiency of SO_2

removal. We guarantee 90 percent removal of SO_2 in the stack gas, 97½ percent of the SO_2 in the stack gas, and in excess of 85 percent of the—I am sorry. I gave that backwards.

It is in excess of 97½ percent of the fly ash in the stack gas and in excess of 85 percent of the SO_2 in the stack gas.

Q Have you had inquiries or negotiations with any utilities in the State of Illinois with regard to your process?

A We have had inquiries. We have had no negotiations.

Q What companies have you talked to?

A We have spoken to Commonwealth Edison. We have spoken to Central Illinois Lighting & Power, I believe, whose offices are in Peoria.

Q Any others?

A Not that I can be certain of.

Q What systems, in your opinion, are now available [2054] for commercial usage? I believe you have testified that you believe your system is available for commercial uses, is that correct?

A Yes.

Q What other companies are there—

MR. HAUBOLD: Your Honor, I object.

THE COURT: Let him finish his question.

BY MR. EISEN:

Q —which, to your knowledge, are offered it a guaranteed basis?

A The Monsanto process has a guarantee, and as for the others, I cannot speak for their guarantees.

Q When you talk in terms of guarantees, at least so far as Wellman-Lord is concerned, how do these guarantees compare with the guarantees Wellman-Lord offers with regard to its other processes?

MR. HAUBOLD: I object unless Mr. Eisen specifies a little more clearly what other processes he is referring to.

THE COURT: Reframe your question.

[2055] BY MR. EISEN:

Q I am afraid we skipped over something when I was asking about Wellman-Lord.

Could you describe just generally what the business of Wellman-Lord Company is with regard to chemical processes?

A Wellman-Lord is predominantly involved in the agriculture and industrial chemical sectors. We offer sulphuric acid plants, phosphoric acid plants, nitric plants, phosphate chemical plants, phosphate chemical plants as related to the fertilizer chemical industry.

We offer fluoride and fluorine recovery processes. We offer processes for the manufacture of fluosilicic acid, a water fluoridation chemical. We offer process for the production of hydrofluoric acid, which is used in fluocarbons.

We offer general construction services to industry. We recently have constructed an aircraft assembly plant, and we are presently engaged in doing some work for a major cement company.

Q That will be sufficient for my next question.

Mr. Craig, do you offer reliability guarantees, reliability of operation guarantees, on these processes?

[2056] A We guarantee a production rate. In other words, the client is given a guarantee that the plant will produce so many tons per day and we assure him that the plant will run for so many days per year.

Q Do you give a similar reliability guarantee to the SO_2 removal process?

A That's right. Yes.

Q Do you know whether or not there are any sulphur removal processes presently in operation on utilities in the United States?

A I didn't hear the question.

THE COURT: Read the question.

(Question read by the reporter.)

BY MR. EISEN:

Q That would be utility generating stations.

A I know of the one in the Kansas Power & Light, in Lawrence.

Q Are there any in operation in other countries that you know of?

A Not to my knowledge.

Q What is the Reinluft process?

A It is an older German process which uses an activated char as an absorbent. In other words, as compared to our wet system, it uses a dry system.

[2057] Q Is that in active operation now, that system?

A I don't know. I believe so.

Q Is your system being used abroad.

A No.

Q Did a Japanese company or companies secure a license to use the Wellman-Lord process?

A Yes.

Q What companies are those?

A Mitsubishi Heavy Machinery Company and Sumatoma Chemical Engineering Company jointly licensed the rights to our process.

Q Could you tell us, if you know, what if anything they have done with the Wellman-Lord process?

A They are offering it—period. They have not consummated anything with anyone.

Q Have they carried on further development on their own of your process?

A Yes.

MR. EISEN: No more questions.

THE COURT: Any cross examination?

MR. HAUBOLD: Yes, your Honor.

* * * *

[2062] CROSS EXAMINATION

BY MR. HAUBOLD:

* * * *

Q So, if I understand you correctly, to increase the reliability of the system, an electric utility, for example, would have to expend considerably more money to install back-up equipment?

A More. Not necessarily considerably more. More money, certainly.

Q Do you have any opinion as to what specific quantity guarantees in terms of number of days per year Wellman-Lord would be prepared to make? Let me rephrase the question.

Would Wellman-Lord be prepared to guarantee continuous operation of your system for 300 days a year?

A Yes.

Q I understand, Mr. Craig, that the system that Wellman-Lord devised has been used on only one sized power facility thus far, has it not?

A Right.

Q At Baltimore Gas & Electric?

A Right.

Q Isn't it a fact that at the Baltimore Gas & Electric plant that Wellman-Lord was only able to achieve continuous operation at rate for only 20 percent of the time?

A That's right.

* * * *

[2065] Q Is is a fact that based on the current projections of Wellman-Lord's in connection with a sodium-based system for a 500 megawatt generating facility, that you now are estimating investment costs of $15.50 per kilowatt?

A Yes.

Q And is it not a fact also that you are currently estimating that cost per ton of coal burned in dollars per ton at $1.60 in the 500 megawatt—

A Yes.

Q Mr. Craig, can you predict with any reasonable degree of engineering certainty when the Wellman-Lord or any sulphur dioxide process for that matter will be demonstrated to be economically feasible in an electric utility power generating facility?

A Can I have that rephrased?

THE COURT: Read the question.

Q (Read by the Reported.)

BY THE WITNESS:

A May I ask, your Honor, what counsel means by "economically feasible."

BY MR. HAUBOLD:

Q Well, in the context of this question shall I say—if I rephrased it and make it "commercially [2066] feasible," does that assist you?

A Yes.

• • • •

[2068] Q In terms of reliability, I take it what you are saying is the utilities have to have virtually complete reliability so that they are not faced with the possibility of either polluting the air or turning the lights off?

A No. If you will pardon me, the utility wants to have a device which will permit them neither to pollute the air nor turn the lights out. They don't have to have that.

Q Do you have any opinion whatsoever when the Wellman-Lord process or any other process will become commercially acceptable?

A I would say within five years.

Q Mr. Craig, I would like to ask you about some of the assumptions made in the compilation of some of your cost projections. We have talked about the current cost projections which are in excess of those contained in Defendants' Exhibit 89. If I understand the Wellman-Lord process correctly, you assume there is a byproduct credit. In other words, the cost is diminished because the process can recover some commercially saleable product is that correct?

A Right.

Q You also have assumed, have you not, that a [2069] utility purchasing this Wellman-Lord system would necessarily market this product, would have to sell it to someone, is that correct?

A Yes.

Q Isn't is a fact, Mr. Craig, that the economics of marketing sulphur dioxide or elemental sulphur is highly dependent upon where a plant will be located?

A Yes.

Q Isn't it also a fact that a plant located in a non-urban area which would not be adjacent to convenient transportation to the natural markets for sulphur or

sulphur dioxide would experience higher economic costs in the operation of their sulphur control device?

A Yes.

Q In fact, Mr. Craig, there are situations, which might exist in less urban areas, where it might cost a utility money to dispose of the product. There may be a byproduct deficit rather a credit.

A Yes.

MR. EISEN: Your Honor, I know I left the last question and answer go by, but I think, unless it is limited to our marketing area, I would move that both the question and the answer be stricken as being outside the scope of the complaint.

* * * *

[2075] Q In fact, Mr. Craig, the difficulties involved in the operation of the Baltimore unit with the potassium system of Wellman-Lord were so great that Wellman-Lord has, in effect, scrapped this system for utility power generation use.

A I will qualify that. Certainly for coals above 1.5 percent sulphur, yes. We recommend sodium system.

Q Is it not a fact, Mr. Craig, that the sodium based Wellman-Lord system which you are now recommending has never been employed on a utility power generation facility comparable in size to the Baltimore Gas & Electric plant?

A Yes, that is a fact.

Q You testified that you received financial help in financing the Baltimore Gas & Electric facility, did you not?

A Right.

Q A number of the contributors to this project were electric utilities, were they not?

A Yes.

Q Have any of the electric utilities which participated in the Baltimore Gas & Electric joint venture agreed to install either the Wellman-Lord [2076] potassium or the sodium system on any of their utility power plants?

A No.

Q In fact, has any electric utility committed itself to

install or employ the Wellman-Lord process, either sodium or potassium, on a power generation facility?

A No.

Q Has the Federal Government granted any money to Wellman-Lord for development of this system?

A No.

Q Did you within the last year, and by "you," I mean Wellman-Lord, submit certain cost figures to the Government in connection with the Stanford Research Institute project?

A We submitted data to Stanford Research.

Q Involving the economics of the system, is it not?

A Yes.

Q You also supplied to them certain information concerning the operation of the system?

A Yes.

* * * *

[2080] REDIRECT EXAMINATION

BY MR. EISEN:

Q Mr. Craig, is there a greater problem in getting rid of pseudo-gypsum than is involved with getting [2081] rid of the radioactive waste materials from nuclear plants?

MR. HAUBOLD: I object unless Mr. Eisen can lay any foundation as to the witness' knowledge in terms of radioactive disposal.

THE COURT: Objection sustained. Reframe your question. Lay the foundation.

BY MR. EISEN:

Q Counsel asked you whether you have had some familiarity with Combustion Engineering's process and the waste material given off by that process, is that correct?

A Yes.

Q Are you familiar with your contacts in the energy field with the radioactive waste products given off by nuclear plants?

A No.

Q Do you believe that Wellman-Lord will be able to sell an SO_2 recovery system to any electric utility within the next two to five years?

A Yes.

Q You referred to a nominal size utility. Could you tell us what you meant by that?

A Something from 250 megawatts up.

[2082] Q I believe counsel asked you whether Mr. Griswold, who got out this report on behalf of the defendants—

A Right.

Q (Continuing)—whether he was well renowned.

What is the reputation of John Middleton, the Assistant Secretary of Health, Education & Welfare in charge of pollution?

A A very dynamic, progressive individual who looks like he's going to get something done.

Q The cost figures represented in Defendants' Exhibit 89, which was shown to you, on page 43 thereof, do you recall that?

A Yes.

Q Are those cost figures generally within the parameters as stated by Mr. Garvey that I asked you about on direct examination?

A Excuse me. Is that—

MR. HAUBOLD: I object, your Honor. I think it is very unclear and vague as to what Mr. Eisen is referring to when he says "parameters."

THE COURT: If the witness knows what the word means, he may answer in the context in which it is put.

[2083] BY THE WITNESS:

A Excuse me. Is this referring to Mr. Garvey's three to eight percent?

[2084] BY MR. EISEN:

Q Three to eight percent increase in cost.

A Increase in the cost?

Q Yes.

MR. HAUBOLD: Your Honor, the statement read by Mr. Eisen concerned a cost of electricity to residential

consumers and I do not believe that the cost figures which have been set forth in Defendants' Exhibit 89 purport to reflect such figures or that they even purport to include or involve cost to residential consumers.

THE COURT: How are they comparable?

MR. EISEN: I would think it is self-evident, your Honor, that the cost would be reflected in the cost of electricity to the consumer. That is what Mr. Garvey is referring to in his speech.

THE COURT: I do not know. There is nothing in the record whether it is to a consumer, to a manufacturer's plant or what, and it is my understanding of the testimony that you have all different types of rates. That is, not of this witness, but the testimony in the record, and I think it should be shown how one is connected with the other, if at all.

How much longer are you going to take?

MR. EISEN: Just about two minutes, your Honor.

[2085] THE COURT: All right. Proceed.

BY MR. EISEN:

Q Mr. Craig, what would be the percentage of cost of fuel—production of electricity, excuse me, to a utility if they were to employ the Wellman-Lord sodium process?

THE WITNESS: I have to qualify this answer, your Honor.

THE COURT: You may.

BY THE WITNESS:

A On the fact that Wellman-Lord projects costs from Wellman-Lord's knowledge of the accounting art, and this does not necessarily mean that it agrees with the utilities art. Generally, the answer to that question as we project the costs is about 10 percent.

BY MR. EISEN:

Q Do you have an opinion on the saleability of sulphur or sulphur compounds as are produced by these systems in the state of Illinois?

A Yes, I have an opinion.

Q What is that?

A It should be reasonably good.

Q Would you say, Mr. Craig, that considering the amount of public opinion that has been marshalled [2086] to solve the environmental and ecological problems which this country and the world is facing today, and the amount of concentrated effort by scientists, technology and governmental bodies, that we will solve the SO, emission problem from stack gases of coal generating stations in the next five years?

MR. HAUBOLD: I just object on the fact that it is a highly leading question, your Honor, and sounds like Mr. Eisen is testifying.

THE COURT: It is what?

MR. HAUBOLD: It is a leading question.

THE COURT: Oh, he may answer, if the witness knows.

BY THE WITNESS:

A There is no question about it.

THE COURT: You asked the same question.

MR. EISEN: Thank you, your Honor.

THE COURT: All right. Is there any recross?

MR. HAUBOLD: No further questions, your Honor.

THE COURT: All right. Thank you, sir. You are excused. You can go back to Florida.

(Witness excused.)

MR. CUSACK: Your Honor, I hate to burden the Court with one very slight matter on your instructions.

THE COURT: All right.

[2090]

IN THE UNITED STATES DISTRICT COURT
NORTHERN DISTRICT OF ILLINOIS
EASTERN DIVISION

No. 67 C 1632

UNITED STATES OF AMERICA, PLAINTIFF

vs.

GENERAL DYNAMICS CORPORATION; THE UNITED ELECTRIC COAL COMPANIES; and FREEMAN COAL MINING CORPORATION, DEFENDANTS

Before HON. EDWIN A. ROBSON, Judge,
Monday, April 20, 1970,
10:30 o'clock a.m.

PRESENT:

MR. JOHN THOMAS CUSACK,
MR. HUGO SIMS,
appeared for plaintiff;

MR. HAMMOND E. CHAFFETZ,
MR. REUBEN L. HEDLUND,
MR. DONALD G. KEMPF, JR., and
MR. RICHARD H. IRVING, III,
appeared for defendants;

ALSO PRESENT:

MR. JAMES M. FOLSOM

* * * *

[2098] PETER O STEINER,

called by the defendants herein, having been first duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. HEDLUND:

Q For the record, would you please state your name and present occupation.

A Peter O. Steiner, professor of economics and law at the University of Michigan.

THE COURT: Would you spell your last name?

THE WITNESS: S-t-e-i-n-e-r.

THE COURT: Thank you.

BY MR. HEDLUND:

Q You are, Professor Steiner, a member of the law faculty of the University of Michigan, is that correct?

A Yes, I am.

Q Would you just briefly tell me what degrees that you have and from which institutions and which years.

A I have a Bachelor of Arts degree from Oberlin College in Oberlin, Ohio in 1943, a Master's degree in economics from Harvard University in 1949, [2099] a PhD. degree in economics from Harvard in 1950.

MR. HEDLUND: Your Honor, the rest of Professor Steiner's qualifications and background are in evidence already as a deposition exhibit of his deposition. I do want to ask one further question.

BY MR. HEDLUND:

Q You have, Professor Steiner, have you not, published a textbook on economics with another author?

A Yes, I have.

Q Could you tell me what the name of that textbook is?

A It is called Economics.

Q Could you just generally describe the purpose and function of that book?

A It is one of a number of books that are provided for the basic first year course in economics.

Our particular book, I have a co-author on this, is designed for what we feel are the more rigorous better first year courses.

Q Could you give me some idea—well, let me ask you first how many editions of this have been published?

A It is now in its second edition. We are at work on the third.

[2100] Q Can you give me some idea of the extent to which this textbook is used on college campuses in the country?

A I just got a publisher's brochure that advertised in the first year of the second edition it had been adopted by 140 colleges or universities.

Q 140?

A Yes.

Q Professor Steiner, since you were asked by the defendants to become involved in this litigation last year, could you give me a rough estimate of the amount of time that you have spent in familiarizing yourself with the record in this case and the documents and in working generally in terms of analyzing the data?

A In elapsed time it has been something over a year. In terms of total hours, if I may give you just a rough guess, I would think between 400 and 500 hours.

Q Could you tell me generally what portions of the record, including the trial, that you have tried to become familiar with?

A I have either attended or read the entire transcript of the trial. I have read all of the [2101] depositions at least once. Some I have read twice.

I have looked at most, though I do not think all, of the deposition exhibits. I have looked at a great deal of the associated matter that applies to interrogatories and so on.

Q What about exhibits that have been introduced here at trial?

A I believe I have looked at all of these. I don't guarantee I remember everything that was in this entire record.

Q As an economist, Professor Steiner, what do you believe generally are the basic steps one must first take in attempting to evaluate the effect of a given merger?

A I think it may be convenient to visualize that evaluation as taking place in three steps.

First is some determination of the relevant market or markets in which the parties to the merger engage.

Second, in forming some judgment as to the intensity of competition in each of those markets and, third, in evaluating the effects on that competition on the intensity of that competition of the merger in question.

[2102] Q Taking the first step, that is the determination of the relevant market or markets in which the merger has taken place, can you describe for me, generally, what is involved in such a determination and exactly what, if I may ask, what your meaning of or what your meaning is when you use the word "market" or "relevant market"?

A Well, I think that when any economist uses the word "competition," they mean competition in a market.

I think there is no magic formula.

May I start by saying, I think that a market is a collection of relevant—or a collection of similar transactions. If you think of any transaction which is in one sense unique, it has a buyer, it has a seller, it has a well-defined good or service that is exchanged, it has a price, it often has a contract of sale and so on.

A market is usually an attempt to delineate a collection of transactions that are sufficiently similar either in their buyers or in their sellers—or in the intersection of the set of buyers and sellers—that it makes more sense and understanding in what determines that transaction to consider them collectively than to consider them separately; so that my feeling is one looks at the facts of a particular set of transactions, looks at the [2103] purpose one has in mind and attempts to decide which collection of all possible transactions are best included and which are best excluded.

It is always a question of defining boundary lines that includes some transactions and exclude others.

Q Is it not true that in a sense all such transactions or all transactions are unique?

A Sure, all transactions are unique but some are sufficiently similar that there is more than insight in looking at them as a group than in looking at them separately.

Q In looking at them as a group is it necessary to take a look at or to evaluate the time or the place of the transaction?

A I find it very difficult to discuss what is a useful set of transactions without defining more precisely the purpose one has in mind. Once one has defined a set of transactions that appear to be the sensible one for a particular purpose, they usually have a geographic area, and a period of time that is part of that definition. But it is in a sense the set of like transactions that determines the area and the time rather than the other way around, and that in turn seems to me is determined by what it is you are looking for, what [2104] question you are asking and that you then structure the market to best answer the particular question.

[2105] Q How does one determine as an economist the extent of a market, or, if you will, its geographic reach?

A Well, sometimes that is very easy and sometimes it is very hard. It may well be that one has a defined set of transactions that appear to be the ones that one is concerned with, and it then appears that the, let us say, buyers in that set of transactions are in a well-defined, narrowly-defined area. It may well be that the sellers in that group of transactions are confined in a well-defined area, and it may indeed be that both buyers and sellers are in a particular area or areas. Thus, one cannot, it seems to me draw lines around the market or around the set of transactions in terms of locations of buyers or in terms of the locations of sellers.

Alternatively, sometimes one talks of markets in terms of where the transaction takes place and simply the place of transacting, or the place of delivery as distinct from the home offices of either buyers or sellers.

Q To what extent can the political boundaries of a state actually define the extent of a market?

A Well, I think when one draws boundaries [2106] around an economically meaningful set of transactions, it would be unlikely that a purely political boundary would encompass them although I suppose there are some cases where that might be so.

I suppose that where there are state laws that strongly affected the transportation of this commodity, it might well be that a state boundary in that reach of the law or that reach of taxes, something of this kind, define them.

It might be that in approximating a market one would describe it most sensibly in terms of the state or group of states or subdivision of a state.

I suppose what I am saying here is that the set of transactions have to be described some way and it's frequently possible to describe it in terms of geographic areas.

Other times—sometimes these would be political subdivisions—other times it might be such things as a river valley, or along a railroad line which might very well cross state lines; something of that kind.

[2107] Q Will the fact that all the buyers buying a particular product are located in one state, and all the suppliers selling that product are located in one state, would this in and of itself indicate that there is a state market for that product?

A If I understand what you are saying, you are saying that all suppliers to this group of sellers are within that state and we are dealing with a group of customers who are entirely within the state.

In that case, it would seem to me clear that the market, if those were the facts, would be no larger than the state.

I think I would want to inquire further, it might well be that there were smaller markets; for example, if all the buyers in the north half of the state purchased from a group of—one group of suppliers—all the purchasers in the southern half of the state purchased from a quite distinct set of suppliers, it would seem to me it would make more sense to speak of the two separate markets in that hypothetical case.

Q In changing the hypothetical a little bit differently, if all of the buyers in a particular state buy most of the products from the suppliers in that state, and if the suppliers in that state sell most or a [2108] substantial portion of their production to buyers in that state, would that alone indicate that the state is an economically meaningful market?

A I don't think that would alone indicate it. It would certainly push us in that direction. I say that because,

again, there is some possibility that a subdivision—that there would be many markets contained within that area.

It might also be, and I would be interested in whether —in what you mean by most and how influential is the supply that comes in from outside.

Oh, I think in terms of the competitive influence, perhaps, of this supply that comes in from outside, and it might well be that the barest price rise from suppliers within the state would lead that percentage that was coming from outside to expand greatly.

That would seem to me to indicate that the relevant suppliers might well be more widely distributed than the state as well as possibly being less widely distributed in the sense of coming only from a particular portion of the state.

Q Now, I mentioned the word "product" without defining it in the hypothetical that I gave you.

Would it be necessary to know to what extent [2109] that product was interchangeable or could be displaced by a different type of product, but one that could be used for the same purpose.

A Yes, indeed. I assumed there that we previously defined the relevant product but it seems to be quite clear that a particular product defined by certain characteristics might itself either be too broad or too narrow.

Oh, I think in the coal industry with which we are concerned it seems clear that, for example, metallurgical coal may usefully be distinguished from steam coal in terms of lots of factors, including its chemical properties and its price. It seems, furthermore, that it may well be from the point of view of many purchasers that other products are used interchangeably or used as substitutes for that product and from the point of view of those users, for example, gas or nuclear energy may be an alternative source of supply. Thus I would think in an economic sense, in evaluating the market for these certain kinds of purposes, for the extent of competition, one has to inquire quite closely as to whether a particular commodity is a product around which one wishes to define the market, the econo[illegible] market, and to evaluate the effect of competition.

[2110] Q The second step that you mentioned that must be taken in evaluating the effects of any given merger was an evaluation of the intensity of competition in the market in which the merger takes place.

Could you tell me how as an economist one attempts to make that evaluation?

A Well, we have no magic barometer, we have no thermometer, something that simply tells us whether competition is intense or not. We've worried a great deal about it over the years. We tend to say we look for indicia of competitiveness and we look at these often, which sometimes is useful to try and define three different kinds of indications or aspects of the problem of competition; some of which are described as structural things such as the number and size distribution of the sellers; the number and size distribution of buyers; the ease with which entry can occur into the industry or exit can occur; the nature of the product, and that sort of thing.

Secondly—

Q May I interrupt you there?

A Sure.

Q You mentioned the nature of the buyers, I'm sorry, the nature of the product. Would the nature of [2111] the buyers be important in terms of the structural aspects?

A Surely. Lots of aspects of this are, really, characteristics of buyers, characteristics of sellers, characteristics of products. All are important.

For example, one would expect—there is good theory to suggest that well-informed buyers may behave quite differently than poorly-informed buyers—that buyers who make purchasing a major executive responsibility may in effect behave differently than where it is a relatively low level of responsibility, where repetitive major purchases are made can be distinguished from incidental single purchases, all of these characteristics are part of the web of structural conditions that perhaps economists have used at one time or another to attempt to understand market behavior, market performance which are the second, and third—or the third and second—things I want to talk about.

Q Would you, you mentioned market behavior and market performance. What do you mean by market behavior and how that perhaps can be determined?

A Well, market behavior means the way in which the actors in a market—the sellers and the buyers [2112] behave, really. At one extreme, take something that is familiar to all lawyers, collusive behavior—is taken to be by itself a very strong indication of the absence of competition.

The word competition itself, I think, can be used as a behaviorial rather than a structural word, a form of striving, a sense of competition, one against the other; and then the whole pattern then of interrelation, of behaviorial patterns among sellers, among buyers, or the way buyers negotiate with sellers is part of the behaviorial parameters of a particular market.

Q The third factor I think you mentioned is performance.

I would like to ask you what you mean by that and what one does to determine the performance in the particular market?

A Well, again, economists have certain ideals, certain models of how a well functioning market works in terms of achieving low levels of cost of production, trying to produce at something like minimal obtainable cost, and trying to argue that in a well functioning market, price will be forced by competition down toward the levels of cost, that there will be continuous [2113] downward pressures on price and on cost; secondly, as a behaviorial—excuse me—as a performance aspect is really the degree of responsiveness of a market. Markets, and industries, are faced by changes that get imposed upon them, and a well functioning market responds quickly to the challenges put upon it.

If there is an increase in demand, it responds with an expansion of capacity. If there is a change in the nature of demand it adapts quickly to this. In a sense a monopolistic market is often regarded as retarding, holding back those changes for the purpose of the monopolist's profit.

This whole question of progressiveness—it's sometimes called by economists—adaptability, the rapidity, the ef-

fectiveness with which they adapt is a measure of performance, so that—well, to summarize it in a couple of words—economists often look to the nature of price, to the nature of quality of product, to the rate of innovation, to the rapidity of adjustment to change, as some of the kinds of things you expect a market to do, and therefore you attempt to judge how well a market has performed by comparing these things to what might have been reasonably expected of it.

[2114] These things are hard to measure clearly. One doesn't know always how a market would have performed under different circumstances, so one is asking a question of comparing how it did perform against a notion of how it might reasonably have been expected to perform.

[2115] Q You have now discussed three dimensions or aspects of the step of evaluating the intensity of competition in the market and you mentioned structural aspects, the behaviorial and performance aspects.

Is any single one of these the governing dimension in terms of making the evaluation of the intensity of competition existing in a market?

A Well, I think if we could measure them all we would say we cared about performance. Performance is tricky to measure. It's because we think—care about it—that we hope as economists and as lawyers—I think you hope to find links between behavior and performance because it's easier to measure behavior, to observe behavior or to measure structure than it is to make a final evaluation.

It seems to me, for example, that the very clear legal dislike of price fixing is based on the presumption that this form of behavior so inherently leads to poor performance that we are prepared to regard that as evidence of probable poor performance and not inquire further.

In much the same way we tend to regard monopoly as a structural kind of control in the hands of one or a very small number of sellers, is so inherently [2116] likely to lead to poor performance that without more we will regard that as adverse and it certainly is a signal that leads us to look beyond.

If I may go further than that in my answer, it is, I think, at one's hazard except in these extremes and well defined cases, one's hazard takes structural indications alone as a measure of what performance will be. Economists, I think, hope that there will prove to be some easy classification of markets; you can in such and such a set of cases, it is inherently likely to prove anticompetitive and therefore we need not look further.

Now, just as in the law there are certain extremes where we are willing to use per se rules, so I think economists say at certain extremes they are satisfied but for the great bulk of business behavior it's usually necessary to inquire further, and it seems to me that is perhaps why one has major antitrust suits because it is necessary to inquire as to what the facts are.

Q I gather then what you are saying is that the data with respect to concentration, with respect to the size of sellers or indeed the size of buyers, that this is not alone enough to determine what the level of [2117] competition is in any given market?

A Well, that's right. I think that I would say that if we have a properly defined market, one in which we are in effect evaluating, knowing things like market shares and concentration ratios is a great help and it may be that they are at one extreme or the other—either so very small market shares that we say there is inherently no reason to suspect on the structural side any adverse effect (although conceivably there still then could be a set of behavioral activities of the sellers that would lead us to look with suspicion.)

Or, on the other hand, it might be so high that one would say without more one is prepared to regard that as so probably anticompetitive that it's not worth a great deal of time and energy in determination.

But frequently, I really want to say two things here—frequently one is not at either one of those extremes, one is at an area where one wants to look further; secondly, and a point that I think is terribly important that a concentration ratio is never any better than the delineation of the market in which it is measured or a market share, and thus to evaluate a concentration ratio you

have to be satisfied that it is measured in a proper economic market.

[2118] Thus, it seems to me, when one is taking concentration as a proxy for degree of competition, if that is so, one must worry about how good a proxy it is, and, second, whether it's measured in a relevant market.

I think both of those things lead me to want to look beyond the concentration although not denying that concentration is of substantial importance, that we have many statistical associations between concentration and market behavior and between concentration and market performance.

[2119] Q For purposes of illustration could you give me an example of where the concentration statistics would compel you to believe that the market was not competitive but where this becomes misleading because of the, say, unrealistic definition of that market?

A Well, let me give you an example based slightly on my own experience and a few blocks away. I think some years ago there was a merger of the Continental-Illinois National Bank and the City National Bank, two banks out of the 15,000 in the United States, two banks out of the two in the 200 South block of LaSalle Street.

If one regarded that merger alternatively as being a change in the number of banks in the United States from 15,000 to 14,999, one might say that is a trivial change in concentration and say the effect was de minimis.

It seems to me that would be unwarranted. It was not true all of those banks were, in the real sense, in the same market.

By the same token, you might have regarded that as two banks on the 200 block of South LaSalle Street and said the effect of that was to go from two sellers to one seller and see the creation of [2120] a monopoly. It seems to me at the other extreme that was equally unwarranted.

There are alternative definitions. Whether it was the Chicago Metropolitan area or a wider area that was the relevant market had to be determined before one could compute market shares, concentration ratios and make sense of them. In that absurdity of extremes there, you

can always draw a circle around a seller in such a way that he is a monopoly.

You can always define a group of buyers for which he is the only seller.

[2121] One can create a statistical monopoly without having created an economic reality.

It seems to me the economic realities of who the suppliers are and the alternative suppliers are what control when we determine how intensive competition is.

Q Professor Steiner, if you will, I would like to get down to some of the facts in this case.

A I thought you might.

Q You have become familiar, have you not, with the Government exhibits in this case, relating to the number of producers in Illinois in the period of 1957 to 1967, have you?

A Yes.

Q And you have become familiar with the Government exhibits with respect to, not the number of companies, but the number of "leading companies" and their production share in the three-state area of Illinois, Indiana and west Kentucky, have you?

A Yes, I have.

Q You are familiar, are you not, with the Government exhibits which relate to concentration trends in both Illinois and the three-state area, are you not?

A The tables that show the share of the top two, [2122] the top four, the top ten, yes, I am.

Q And you are familiar as well, are you, Professor Steiner, with the tables prepared by Dr. Bruce Netschert and his report which is in evidence?

A Yes, I am.

Q And you have read the deposition of Dr. Netschert, have you?

A Yes.

Q And the deposition and report of Dr. Gerber?

A Yes.

Q Looking directly at the Government exhibits which I have mentioned, they indicate that in the period of 1957 to 1967, and I don't mean to characterize them as they say what they say, but for the purposes of getting

this discussion going, they indicate that in this period of 1957 to 1967 for Illinois there has been a substantial decline in the number of Illinois coal producers.

[2123] There is other evidence to indicate that in that same period of time there has been a substantial decline in the number of mines, coal mines in Illinois.

Going to the three-state area, the evidence indicates that there has been an increase in the size of the "leading companies" which has also been true for Illinois, and we see particularly from Dr. Netschert's tables that there has nationally been an increase, a dramatic increase in the size of mines.

I want to now ask you, first, what are the possible explanations for the decline that we have seen in the coal industry in the number of companies, the number of mines and the increased size of the surviving companies, if you will, and the surviving mines?

A I think you said at the—

MR. CUSACK: Your Honor, may I pose an objection here for the record?

THE COURT: You may.

MR. CUSACK: The Supreme Court of the United States in the case of United States against Pabst Brewing Company, handed down in June of 1966, stated very clearly that the cause of concentration and attrition [2124] and cause for mergers, whatever cause, that the key thing was whether or not there was a trend of concentration and attrition in the industry regardless of the cause; and on this basis I object to this line of questioning.

THE COURT: He may answer subject to the objection. The objection may be noted.

MR. CUSACK: Thank you, your Honor.

BY MR. HEDLUND:

Q Do you have the question, Professor Steiner?

A Yes. I think in the first part of your question you spoke of the decline of the coal industry. I am not sure the record does show that. You are talking—

THE COURT: Speaking of the terms in decline of numbers.

BY THE WITNESS:

A (Continuing.) If I understand the question, you are asking me are there various possible explanations that one might advance before one looks at the facts; and I am always suspicious of people who say there are three possible reasons for something because there may easily be more, but let me suggest at least three different kinds of explanations that might, before one [2125] looks at the facts, be offered.

One is changes in industry structure of a magnitude of a really dramatic nature of what we have observed here in a relatively short time which might be due to changes in conditions of demand for the product in question and dramatic changes in demand often require, compel and thus, if the industry is responsive, lead to a series of adaptations which lead to changes in the structural characteristics of the market. There are historical examples of that.

[2126] A second kind of explanation might come from the supply side, the technological side. You may have a major innovation, a major set of new techniques or new products that indeed so restructure the industry producing these and, indeed, a series of industries that they in turn supply, that they may induce structural changes in one or more instances.

Third, is the kind of explanation which perhaps Mr. Cusack was urging on us a moment ago. The third explanation would not put primary weight on either an autonomous shift in demand that led to these changes, nor a change in the supply conditions that led to them but, rather, that it was due to the behavior of existing firms who perhaps, by virtue of a series of mergers, decreased the number of sellers, and it was thus an internal behavioral response here not well explained by outside forces affecting either demand or supply.

MR. CUSACK: Your Honor, in regard to Professor Steiner's comment on my previous objection, I would like to point out that I was not referring to Mr. Cusack's ideas on this question. I was referring to the Supreme Court's idea which is very clear and set out in the Pabst case.

THE COURT: All right. That may be noted.
[2127] MR. CUSACK: Thank you, your Honor.
THE COURT: Proceed.

BY MR. HEDLUND:

Q Based on the record in this case, of the three possible explanations that you have suggested for the decline in the number of companies, the number of mines and the increased size of those surviving, which of these explanations do you feel best explains the reasons for what has happened?

A I think the record seems overwhelmingly clear to me that we have here a demand-induced set of structural changes, changes in the nature of demands for coal both in terms of the decline of the railroad market to virtually nothing, the disappearance or the virtual disappearance or the near disappearance of the home heating market, to the tendency for increasing substitution of gas for coal in the industrial market, but at the same time the substantial rise in the demand by the electrical utilities for coal has itself been sufficient to explain everything that has occurred.

I think that there are really two phenomena, not one, in the question you asked me. One is the disappearance of a very large number of substantially small producers. [2128] The other is a growth in size, in mine size and, to some extent, in company size of the quite large producers.

I think those are not the same phenomena, but I think they are both related to these demand conditions. I would not say there have not been technological innovations, cost changes, supply changes.

There have been. There have been in the techniques of mining, as the productivity increases in both the efficiency of the production of coal and its distribution, but those seem to me, too, to be responses to following on the kind of changes in the demands for coal that have made it possible for coal producers to produce in larger quantities for a rather different market.

Therefore, there have been mergers in this industry and some of those require explanation outside of this

framework, but it seems to me the basic statistics, the dominant statistical picture is one that can be readily understood in changes of the terms of the changes of demand and cannot be understood without taking into account the changes in demand.

THE COURT: Would this be a good opportunity to take a recess?

[2129] MR. HEDLUND: Yes, your Honor.

(There was a short recess, after which the following further proceedings were had herein, to-wit:)

[2130] THE CLERK: The case on trial.

THE COURT: Are you ready to proceed?

MR. HEDLUND: Yes, we are.

THE COURT: You may proceed.

BY MR. HEDLUND:

Q I gather then, Professor Steiner, that you do not believe that this change, if I might use the shorthand word of structure, has been provoked to any measurable extent by a change in technology, the second possible explanation which you suggest?

A That is right; there have been changes but they have not been the provoking changes, to use your phrase.

Q By way of example, could you refer to another industry in which the change in technology has provoked the change in structure?

A Well, there are a great many examples. I think we are in an important sense today undergoing a series of changes in structure provoked by what can be called the electronic revolution with respect to computers and computerization, automation.

In the automobile industry, the assembly line, which was introduced in the Model T Ford, clearly basically transformed that industry in its day.

[2131] In the textile industry also, I think the synthetics, the chemicals, the introduction of chemical fibers transforms most of the textile industries and much of the market structure in those industries.

Going even further back, there is the impact of the open hearth furnace on steel production and so on.

It seems to me our history is replete with examples of where a major innovation or a series of smaller innovations have gotten to the point where they have simply generated important structural changes. My feeling is that the coal industry has not been subject to that kind of a change over this period. The changes have come from the things I mentioned a few minutes ago.

[2132] Q There have, however, have there not been, Professor Steiner, changes in technology in the coal industry?

A Yes. I think that one of the things that has happened in response to this shift of the market to very largely a market, a demand for coal by electrical utilities, has led to markets that can be supplied by large scale production on unit trains, from large mines, and this has made, in part, necessary and, in part possible, the introduction of machinery that is well suited to large-scale production.

I think there have also been in this industry substantial rises in labor cost and, therefore, a substantial, a very dramatic, as it shows in the data, substitution of capital for labor in the production of coal.

As you see the output per man in coal has at least tripled over the last 20 years and this suggests there has been capital substitution in both the mining and the transportation, the handling of it.

I think these have been very important changes, but they seem to me not to have been the innovating changes that led to the other changes.

Q Returning to the third possible explanation [2133] for this change in structure, I gather that you do not believe that the acquisitions or mergers can be put forth as an explanation for this change?

A Again, if I might come separately to the two questions that I tried to distinguish, I see no evidence whatever in any of these statistics that the disappearance of the small producers is due to merger. We do not have a great deal of data about what has happened to what was 127 companies that reduced to 27, if that is the number, the approximate number of the companies under 300,000 in Illinois between 1947 and 1967, but I find—

Q Did you mean 1947? 1957 and 1967.

A Excuse me. I meant 1957 to 1967, over that 10-year period. I find of those small companies which are not identified, very few of them in terms of the production appearing as mergers in any of the mergers that are listed in the lists that I have seen provided by the Government.

I think there have been mergers. I think, as I have looked at those, particularly in this period since 1957, 1959, and 1960, they do not account for very much of the change in the size in Illinois, at least where I have looked closely, of the large producers except for [2134] Peabody.

Peabody clearly has increased its production and its market share quite dramatically in terms of the series of mergers. I think if one effectuates, if one regards the United-Freeman merger as having been affected for control purposes in 1959, in October of 1959, it seems to me the sensible way to look at it, as an economist, I find very few mergers in Illinois of Illinois producers since 1959, except those that Peabody has engaged in.

I wouldn't say there have been none because I think there probably have been, but I remember very few. It is quite clear that what has happened, leaving the disappearance of the small sellers, is not a major phenomena as far as I can see.

These companies, I believe, were producing 25, 50, up to 100,000 tons of coal. Those companies have found their market disappearing, and many of them seem to just have disappeared.

Whether they have failed or whether they have exhausted their mines and quite quietly disappeared, I don't really know.

The large companies, Peabody aside, seem to have grown largely without merger over this period. In [2135] any case, the basic changes in the phenomenon do not seem to be merger-induced.

May I say one further thing about a purely statistical phenomenon. I think there are two phenomena in terms of growth of size, one of which is real and one is purely statistical.

[2136] We start back in 1957 where we have something over 125, perhaps it is 145 coal companies in Illinois. We then have perhaps 80 or 100 of these companies from the small end disappearing.

If nothing else had changed, that mere disappearance of the small companies would increase the average production of the surviving companies and the average production of the surviving mines.

That is this statistical phenomenon would result from the lopping off, if I may use that phrase, of the smaller companies.

There has been, in addition, a growth in the size, in the production in both the share of the production and the production per company and per mine of the larger companies that I think has been real as distinct from statistical.

I think the data that we have shows that larger mines are being built and thus companies having the same number of mines find their production from those mines in total production increasing. There has additionally, of course, been, and this is particularly evident in statistics on Peabody over this ten-year period, there have been a substantial series of acquisitions of substantial companies which [2137] increased Peabody's market share and thus also the share of the top group of companies if it includes Peabody.

It is there, it seems to me, only there that I find the merger explanation of very persuasive force.

BY MR. HEDLUND:

Q I intend to get back to the specifics of what you have just testified to, but I want to go on to a different subject right now, if I may. With respect to these statistics that have been received in evidence as Government exhibits relating to structure and relating to the production shares of each of these companies, I would like to ask your opinion with respect to whether or not these exhibits show what they purport to show or, to put it another way, are they valid or are they misleading?

A I think in many ways they do not show what I would like to see and, thus, I feel that they are misleading. If they purport to show the relevant measure

of concentration in the proper economic market or the properly defined market, I think they are distinctly misleading for a number of reasons.

Q Would you give me those?

[2138] A I will try to mention some of them. I think for the reasons we can go into this in more detail when you want, but I don't think that Illinois is a proper economic market in the sense in which I would use that word.

I do not think the three-state area of Illinois, Indiana and west Kentucky is a market.

I think that these figures err in lumping, as if they are the same products, metallurgical coal and steam coal. All the evidence I have heard in this case suggests that those kinds of coal are so different in terms of who uses them and their cost and how they are used and the purposes for which they are used, that they should be separated.

I think these figures are misleading if they purport to show the extent of inter-product competition. It seems to me one of the things that one cannot escape in listening to the witnesses in this case, reading the depositions and hearing the body of the testimony is the tremendous importance of inter-fuel competition in the market, at least for the electrical utilities and, indeed, in the market for the others, the loss of the markets to the railroads [2139] and home heating where there is the testimony to the inter-fuel competition over the ten or twenty-year period that most of our data covers.

I think the data may be misleading in that they lump all sales to all buyers without distinctions among them. Yet, it seems to me that quite apart from the metallurgical coal, the electric utility market, if I may speak of it that way, or a group of buyers who probably should be separated and treated separately from other buyers, it seems to me they have different requirements.

[2140] I think in other ways one can keep going on. I think that particularly having heard much of the testimony in this record, I am persuaded that coal is not a homogeneous commodity, even steam coal, that things like sulphur content, things like ash, moisture content,

fusion properties, that these things make it necessary to look, perhaps, with some care to see in which instances, in which cases one has to distinguish.

I think that again, or, next, that it is not clear that where commodities are sold on long-term contracts, where production this year is likely to represent in very large extent production committed on a contract signed some years ago, that production is the proper determination, if you like, of a firm's activity in judging, in evaluating the competition now or the future competition.

It may well be that one has to look at the capability of a producer to enter into another contract.

If, as I believe the record shows, this is a futures market, in the sense that what is transacted is a stream of coal deliveries, it is the potential, and I think the record in this case suggests the actuality of production statistics being misleading unless one pays [2141]attention to available uncommitted reserves.

I don't suppose I have covered all the things that disturb me about those data, but those are at least a few of them.

Let me say one word further. May I?

THE COURT: You may.

BY THE WITNESS:

A (Continuing) I don't by that mean to say that I think that approximate statistics, that this is not a counsel of perfection.

[2142] My criticism of these statistics is not that I think they are less than fully perfect. It is that I think they are less good than they should be.

Many of these things I feel critical about should and can, on the basis of this record, may be looked at and we can find a more refined set of markets, set of product definitions, attention to customers and so on.

BY MR. HEDLUND:

Q We have discussed now really just one dimension or one aspect of the evaluation of the intensity of competition in the market.

I would like now to direct your attention to the second dimension or a second dimension that you mentioned,

which was the performance aspect of the coal industry or coal producers; and I would like to ask you what you feel the record in this case shows as to the degree of competition among coal suppliers, and with particular reference to the electrical utility market in this period of 1957 to 1967.

A I think it has a good deal to say about the effectiveness of competition. I think we see and perhaps the most dramatic statistic of all is one of the ones that I think is in one of Dr. Netschert's tables, which [2143] shows that the price of coal per unit energy, that the energy, that is the cost per million BTU's, I believe that is the figure, has not increased over this 10-year period, that this in a period when most costs have gone up, when wage costs in the coal industry have gone up is clearly testament to the fact that the industry and the competitors in this industry are doing their best to hold that market, the electrical utility market, in the face of having lost some of their other markets.

They have succeeded by one means or another in keeping costs low. I think partly this has been due to a growth in size, the ability to use more efficient techniques, the ability to achieve unit rates on trains.

I believe the statistics do show, in fact, that the coal freight rates, another one of Netschert's tables, suggests that they have actually not only increased less rapidly than other freight rates, but they have actually decreased in the last 10 years, that the cost per ton of coal transported has decreased.

I regard all of those things as the kinds of performance you would expect to see if an industry were fighting very hard to keep its prices low. It is not, of course, enough to try hard. You must succeed and, it seems to me, they have succeeded so they [2144] get in a period, in a decade when industrial prices in general were rising, rising not negligibly, that coal has kept the price of its commodity relatively low.

Perhaps another aspect of the same thing is what you see in the productivity statistics, a sharp increase in the output per man-day worked over this period. This, again, is the kind of response you would expect.

I think, finally, and this comes back to something I said a moment ago, you have seen an industry change and adapt to this dramatic change in the demands placed upon it.

The coal industry, as I remember it, not from any detailed study but from the general impression I had of it 20 years ago, was regarded as a dying industry, an industry faced with the decline of its markets.

It was considered to be a sick industry. The industry has responded to this by finding and, apparently, maintaining and keeping production up, finding alternative ways to use its products.

It has responded to this notwithstanding the loss of those markets, notwithstanding the development of a brand new substitute commodity, nuclear energy being clearly a threat to it.

Gas has become an increasing threat to it. [2145] Notwithstanding the fact in a national sense coal has decreased in the percentage share of the total energy requirements, coal has managed not only to hold a market but to hold its price in that market over that 10-year period quite low.

This is precisely, I think, the kind of a thing you would expect a competitive industry, an industry that was faced with intensive competition to have achieved.

Q In summary, what would you say in terms of the degree or intensity of competition that you have among coal suppliers in this period of 1957 to 1967?

A I think you are asking me there to address myself to, was there evidence in terms of performance that led one to reach an inference about how effective competition had been?

Q That is right.

A And I would say the performance is wholly consistent with and suggests to me that there has been intensive competition among coal producers. That has come, in my view, not only from competition among themselves but from competition with alternative sources of energy.

[2146] With the sources, if you will, that have wiped them out of certain markets and threatened to cut out

their relative share of the electric utility market, but they have held a good portion of that market, I would think, by their success in keeping their price relatively stable.

Q In your opinion is this intensive competition or the level of competition which you have described as intensive in the past decade likely to continue?

A Yes, I think that the decade ahead has somewhat different factors than the decade past.

I think it seems quite clear that while it was the rumble of nuclear energy in the last decade it's going to be the fact of nuclear installations in this decade that is visible.

If I recall those statistics of Netschert having less than 1 percent nuclear capacity in place but the levels of orders and the testimony of Commonwealth Edison, the testimony of TVA, suggests a decade from now that is going to look very different.

I think a second source of pressure on coal producers that will require them to be competitive is this very clear and very pervasive concern with the environment, with air pollution.

[2147] Now, I don't know how that problem is going to be solved, but it is going to be solved by increasing the cost of the use of coal, whether that is by the need to find lower sulphur coals or to utilize those, or the cost of removing sulphur from coals when and if that is feasible, all of these things are going to make it necessary for coal to keep its price as low as it can if it is going to effectively compete, to which I think it will not in my own guess, this is based on the record, and I am not an expert in this, and I think it will not keep pace with the growth in electric power; but whether it can keep its absolute market or even increase it somewhat will depend on the extent to which it is able to keep its price low and to respond to the changes and the demands upon us.

I guess I regard this pollution question as again providing a challenge both to the utility and the coal industry. It's the kind of external change in the demand that again puts pressure on the industry, and I

would think that the industry would be under great pressure to adapt to that, in adapting to it, to find ways of producing cheaply, and this, after all, this competition, this striving to meet these challenges is, I think, what competition is all about.

[2148] Q Are there other challenges aside from—other challenges or pressures aside from the two you mentioned in lieu of competition and environmental competition which you think will be present in the next decade that will have an effect on the intensity of competition to us?

A I think that this was implicit in what I said. I think that the rivalry among themselves of coal producers will continue. I think the pressure on coal producers from the buyers of their product, from the electrical utilities, if you think of that group, these are people who are anxious, I think, to keep the costs of their operations as low as they can.

These are large buyers who put pressure—who put pressure on them—on the railroads, and on others, to try to get coal delivered.

So that I think in this context both the intra-coal rivalry and the fact that coal contracts are bargained for across a bargaining table with large informed, capable buyers, all are additional sources of competitive pressure on the coal producer, on the individual coal producer.

I think, by the way, there will be more casualties. I think there are still a relatively large [2149] number of small coal companies. I wouldn't be at all surprised to see coal companies with production of under 100,000 tons to continue to disappear.

I think, as I say, I think that is a different breed of cat, but they are referring to dogholes, so maybe I think we should change the metaphor.

[2150] Q In that regard, Professor Steiner, do you have with you Government Exhibit 72, which is—I want to develop this point a little further—Government Exhibit 72 which is the Illinois production for 1967, and Government Exhibit 85, which is the production for the three-state area?

Do you have copies with you to give the Court?

MR. CUSACK: Do you have an extra copy, your Honor? It's in Volume 10 of the statistics.

MR. HEDLUND: Volume 10, Tab 11, your Honor, and Tab—

THE WITNESS: I have 72, but not 85, Mr. Hedlund.

MR. HEDLUND: I will give you mine. I will give you my Government Exhibit 85.

THE COURT: What tab number was that, Mr. Cusack?

MR. CUSACK: Tab 11 for the production in Illinois of 1967.

THE COURT: All right.

MR. HEDLUND: And you have a tab number for Government Exhibit 85? I assume that is 24 or 25.

MR. CUSACK: You are referring to 86, aren't you?

MR. HEDLUND: Pardon me.

MR. CUSACK: Production of coal in Illinois and [2151] western Kentucky of '66-'67?

MR. HEDLUND: I am referring to 85.

THE COURT: That is No. 25.

MR. HEDLUND: You have that, your Honor?

THE COURT: Yes.

BY MR. HEDLUND:

Q Professor Steiner, looking at Government Exhibit 72 and 85, I am going to ask if you could relate in these statistics in terms of the size of the companies, and having in mind the histories of the companies shown here, the extent to which you can relate this to the, if I may use the term, intramural pressures or challenges among coal suppliers?

A I wonder if I might have that question read back?

THE COURT: Read the question.

(Question read by reporter.)

BY MR. HEDLUND:

Q And whether those pressures are going to continue?

A Well, I think one of the things that, if I may look at the Illinois figures, that there are—if we look at the eight leading suppliers—that will be to Ayrshire—we have eight producers—substantial [2152] producers

in terms of tonnage, and if I look back to 1957, I find those eight producers also with substantial shares.

I think one of the things that—if one looks at the group and I don't know if this is what you had in mind, Mr. Hedlund—but if you look at the group from the third to the eighth of these companies, they are all substantially sized, clearly of a size that is capable, if they have reserves to back up this level of production, capable of continuing to operate in a utility market.

They have not—if I remember the statistics year by year—not found themselves losing ground over this 10-year period—that is the contrast between these large companies in this decade and the much smaller companies, the remaining companies as they are here called, has been very different.

These companies appear to have a size that has made them at the beginning of this period significant factors in that market—at the end of the period significant factors in that market—and I know of nothing in the record that suggests that situation will change.

I see no tendency, for example, in Illinois for companies with production in the neighbor- [2153] hood of two, three, four, five and six million tons no longer be strong competitors. I will put that positively. The evidence, as I see it, is that those companies are in a position to compete in this market.

Q This would, of course, would it not, Professor Steiner, depend upon the reserve base of these eight companies?

A Well, that's right. I said, and with one of the troubles with looking too long at these statistics is that they show what they show and they fail to show certain other things.

If we assume these companies have reserves—what I am saying here, I think, is, and perhaps you are saying the same thing—is in order to be an important competitor in this market one clearly needs both; production capability and the coal to produce, and thus both production capability and reserve capability are important.

I was addressing myself to the fact that while the small companies, the remaining companies which have

been disappearing and which I would expect would continue to disappear, do not seem to me to lack the production capability to deal in this market.

[2154] This other group of companies do have that capacity, and I think you see much the same thing in the three-state area table, but you have, in that case, I think, ten companies over 2 million tons, and they all look to me in the sense in which the record discloses any thing at all about what is required for viability, and I think it discloses a good deal, they all look to me to be viable competitors.

[2155] Q I would like now to go back to the subject that you mentioned, and that is the definition of the markets that have been adopted by the Government in this case.

As you know, their statistics and their contention holds that there are two relevant markets, one the State of Illinois, and the second what has become—has come to be called the Eastern Interior Coal Province sales area, which I will not even attempt to describe, but which involves some seven or eight states or portions thereof.

I believe you have testified that you are not satisfied that either of those markets were in fact economically realistic, and I would like to ask you why you feel that way?

A I think I haven't so stated with respect to the Eastern Interior Coal Province sales area but I do, I now so do.

I think the reasons are different for the two although they are part of the same basic argument. I think neither one of those two designations corresponds to the kind of homogeneous set of transactions that it makes sense to look at separately, as a whole, and to exclude other transactions.

[2156] If I might take, first, the notion of the Illinois market. I think if one looks, for example, at some group of producers—and I am now just glancing and looking at the producers in the Belleville area—having looked at their statistics with respect to where they ship their coal, I find that their customers tend to occur in several

states; that indeed if I were defining their market area, it would be defined more by the Mississippi River Valley than either the State of Illinois or a group of other states.

MR. CUSACK: Excuse me, Professor, your Honor, may I say something? May I please have a continuing objection on the record, your Honor, on testimony in regard to the relevant geographic market in the light of U. S. v. Pabst Brewing Company, 384 U.S.

THE COURT: You may have a continuing objection on that subject.

MR. CUSACK: Thank you very much.

BY THE WITNESS:

A I was talking about why I was unhappy with the Illinois market.

One reason I am unhappy is, I think a great deal of the coal that is produced in particular regions of Illinois is not in fact shipped either [2157] uniformly throughout the State of Illinois, nor indeed so limited.

To use perhaps one example, using that Belleville area. We can look at others, if you want.

The second from the point of view of customers, if I turn the thing around, if I take a group of, let us say, utilities located in a portion of Illinois, it is not true either that they buy all of their coal from Illinois or that they buy entirely throughout the state. They may, indeed, have much more narrowly defined areas.

I think that for both of those reasons, and the fact as I said earlier, that I believe one can do better on the basis of the data collected either by the Government or by the defendants, we can get a better approximation of the markets, we shouldn't use that.

I find, secondly, the notion of the Eastern Interior Coal Province sales area genuinely baffling. I spent a good deal of time trying to figure out the criteria by which the Government defined that particular area. It is perfectly clear that there are customers outside of the area who receive substantial [2158] amounts of coal produced within the State of Illinois, for example. This is true of that area that is excluded in the State of

Wisconsin, up north of Milwaukee, up toward Green Bay, Sheboygan, Manitowoc, and so on.

I also find substantial amounts of production by producers within that area that goes outside to other areas and at the same time areas within the sales area that receive none of this coal.

Looking at the Bureau of Mines statistics, for example, I looked at west Kentucky producers who are within that area. They ship virtually no coal, some I think, but virtually none to eastern Iowa or eastern Missouri. They ship a great deal of coal to Mississippi and Alabama. I do not know the logic by which that area is defined.

By the same token, there are areas within that, there are areas within some senses are much too narrow. Are you saying this is every place that coal goes that is produced within the area? The answer to that is no.

On the other hand, it's much too narrow—excuse me—much too broad in the sense that there are clearly large areas within that market that [2159] do not receive coal from other regions within it.

I think virtually none of the coal that I know of that is produced in southern Illinois; Belleville, Springfield, Fulton, Peoria, goes to Indiana, for example. Very little of the Indiana coal comes to Illinois. It does not then have the kinds of cohesiveness of a group of transactions that seems to me to make it necessary for—sensible to treat it as an economic market.

But I have, really, have the basic trouble perhaps this will be cleared up on cross examination, I do not understand how the Eastern Interior Coal Province sales area was drawn and not understanding that I cannot discuss the logic of its being drawn in that way. It seems to me not to be in accord to the facts, as I read them.

[2160] Q In summary then, if there is no such thing in terms of economics or economic analysis of an Illinois coal market, and if there is no such thing again in terms of economic analysis as the Eastern Interior Coal Province sales area, how does this affect the validity or the meaningfulness of the production shares of companies produc-

ing coal in Illinois or production shares of companies producing coal in the three-State area?

A Well, as I think I testified earlier, I do not believe production shares, market shares, concentration ratios make sense at all, or have any genuine indication of the degree of competition unless they are measured in a meaningful economic market. I think that without a market one does not have the basis of using these statistics. Within a market one has certain problems in using market shares, but I think that those are so greatly intensified when one has, one does not feel it's a sensible market because it's too broad or because it's too narrow.

I don't believe you just draw circles on a map and say that is a market. I think you can do that, but I think you lose economic insight when you define markets in that way, and you lose insight, the insight, [2161] that concentration ratios give when you define them in that way.

MR. HEDLUND: Your Honor, I am about to go into a new and rather lengthy area. Would you like to adjourn?

THE COURT: Why not go for another 10 minutes because we have a deadline that is coming up.

May I inquire how much more do you anticipate that you will take?

MR. HEDLUND: Your Honor, I would think I would have about another hour with this witness.

THE COURT: Another hour?

MR. HEDLUND: Another hour.

THE COURT: So we put it in the right posture, if we take that recess, can you proceed much more effectively or use the 10 minutes to advantage?

Do you have a comment?

MR. CUSACK: My comment was, as told by Mr. Hedlund at the last break, he would go all day with Professor Steiner. You do think you will finish in an hour?

MR. HEDLUND: Yes. I think I will finish in an hour.

* * * *

[2171] THE COURT: You are entitled to your interpretation, certainly, and I think it was not made a part of the record here. Mr. Bane should be here so he would have that opportunity. That is the only thing I have to say.

As far as the Court is concerned, if it all [2172] has to go on the record, it goes on the record. I indicate and I will make a ruling as to whether I think the offer of proof made here is an essential part of it.

The only question I had was whether or not the preliminary remarks—Mr. Cusack, I am well acquainted with the rule he cited here, and all I thought was that there was an understanding between counsel, and I look at it as officers of the court, and I say there is nothing in there to indicate that, but we have to live together and we have to work together, and I say to take that element of it in mind and, certainly, Mr. Bane should be considered on it.

We will put it over to 10:30 tomorrow morning which will be about the time we get started. All right, thank you.

Are you ready to call your witness, Mr. Cusack?

MR. CUSACK: Yes, your Honor.

MR. EISEN: I am sorry, your Honor. I didn't know we agreed to put this man on the first thing. Otherwise, he would have been here.

THE COURT: All right.

ROBERT H. QUIG,

called in rebuttal by the plaintiff herein, having been first duly sworn, was examined and testified as follows:

[2173] DIRECT EXAMINATION

BY MR. BRAUN:

Q Would you please state your name for the record?

A My name is Robert H. Quig, Q-u-i-g.

Q What is your address, Mr. Quig?

A My business address is 320 Park Avenue, New York, New York.

Q By whom are you employed?
A I am employed by Chemical Construction Corporation.
Q Is that firm sometimes known by the name Chemico?
A Yes, it is.
Q How long have you been employed by Chemico?
A I have been employed by Chemico for three and a half years?
Q Could you briefly describe for us your experience in the field of air pollution.
A Yes, for the past three and a half years I have been employed by Chemico with the title of engineer, utility operations; and in that time I have been in charge of the management, control and development of pollution, the development of pollution control [2174] systems for use on power plants and other stationary sources to control various discharges of pollutants.
[2175] Q And for how many years, if you know, has CHEMICO been engaged in the study and research on pollution?
A CHEMICO's corporate business has been for over 50 years in the chemical process industries and for approximately 25 years in the construction of pollution control systems.
Q Could you briefly describe your educational background and the extent to which you have received any degrees.
A I am a graduate mechanical engineer from college, Lafayette College, and I am a registered professional engineer.
I have a graduate degree in Business Administration.
Q Does CHEMICO have a commercially feasible process for the removal and disposal of sulphur dioxide gases which are created by the generation of electric power?
A CHEMICO—yes, CHEMICO has a process to offer for the removal and disposal of stack gases from power plants.
Q Could you explain this process and how it works.
[2176] A Yes. We would approach a pollution problem on a power plant for a disposal effort in that we

would build a scrubber system whereby the flue gases discharging from the boiler of the power plant would be diverted into the scrubber, and at that time absorption of the SO_2 would be done by the addition of alkali such as calcium oxide, and this calcium oxide can be obtained from various sources, limestones and limes in a regional area.

In the scrubber the calcium oxide reacts with the sulphur dioxide forming calcium sulphide and sulphate which, in turn, is discharged to a disposal area similar to the removal of fly ash or bottom ash from the boiler.

Q And is this process one which, in your professional judgment, could be installed on an electrical utility generating station commencing tomorrow?

A Yes, it can.

Q Does CHEMICO also have a process for the removal and recovery of sulphur dioxide stack gases?

A Yes, we have a process.

Q Would you explain how this process operates?

A Essentially using the same scrubber arrangement on the power plant we would add, instead of calcium oxides, a better absorbent material, and in this particular case with CHEMICO it is magnesium oxide.

[2177] The magnesium sulphide and some sulphate that is formed is withdrawn from the scrubber system as a dried material, and then it is transported away from the power plant where it is converted through processing techniques to release the SO_2 again, this time under a controlled environment basis.

The SO_2 can then be converted directly to sulphuric acid or through the utilization of reduction techniques, elemental sulphur can be recovered.

The magnesium oxide is regenerated and recycled back to the power plant for reuse in the scrubber system.

Q Do you have an estimate of the costs of installing your system which could be based on cost per million British thermal units?

A Which system are you referring to?

[2178] Q Do you have an estimate of the cost with respect to your disposal system based upon whatever the cost would be per million BTU's?

A Estimates of investment and operating costs are determined by several inputs, and it is hard to give a specific example.

As a general across-the-board estimate, though, we look at, say for example, a 600 megawatt power plant having an investment burden of seven to ten dollars per kilowatt, and the disposal costs, along with the capitalization costs and other utility and overhead maintenance costs, it is conceivable you can have a total operating cost of approximately a dollar per ton of coal which is three to four cents per million BTU's fired.

Q Could you similarly describe the estimated costs on your process for the removal and recovery of sulphur dioxide gases?

A The recovery process for the utility power plant site would have the same scope of investment costs. The recovery investment and operating costs we concede to be that of others, and the reason that one would go to a recovery effort is to avoid the disposal problems associated with a calcium-based scrubbing system.

[2179] Q In your professional judgment, would adding the costs of your pollution control equipment to a new coal-fired generating unit be more or less expensive than the cost of building a similar sized nuclear generating station?

MR. HAUBOLD: Your Honor, I object unless counsel lays a foundation as to this witness possessing knowledge of the nuclear industry.

THE COURT: Lay the foundation.

BY MR. BRAUN:

Q Mr. Quig, have you or any of the companies with which you are associated, manufactured or designed nuclear power plants?

A My company, Chemical Construction Corporation, does not build nuclear power plants, but in our discourse on the whole problem of environment, we have been led to believe from the many utilities and engineer organizations which we deal with that we under most conditions could build a SO_2 removal system that would be cheaper than a nuclear unit at this time.

MR. HAUBOLD: Your Honor, I object to the testimony of the witness to the extent that he has been led to believe certain facts, and I move that it be stricken as unresponsive.

[2180] THE COURT: Do you have any comment?

MR. BRAUN: He has testified that he has been led to believe that by engineering studies as well as by what would otherwise be hearsay.

THE COURT: The latter part would be stricken because it shows he has no direct acquaintance with it, that he is led to believe. There is no basis for cross examination.

MR. BRAUN: May I approach the witness?

THE COURT: You certainly may.

MR. BRAUN: I will ask the Court Reporter to mark, for identification, a Chemico brochure entitled "Removal and Recovery by the Central Process Concept" as Government Exhibit 312.

(The above-described document was thereupon marked as Government Exhibit 312 for identification.)

MR. BRAUN: May I approach the bench, your Honor?

THE COURT: You may.

* * * *

[2185] THE COURT: Well, let me state that I will admit it subject to a motion to strike if it is shown on cross examination that there is not the proper foundation for the underlying documents which is incorporated in and made a part of this speech.

MR. BRAUN: Thank you, your Honor. I have no further questions.

(Whereupon, the document previously marked as Government Exhibit 313 was received in evidence, subject to a motion to strike.)

THE COURT: All right, are you ready to cross examine?

MR. HAUBOLD: Yes, your Honor.

THE COURT: All right, you may proceed.

CROSS EXAMINATION

BY MR. HAUBOLD:

Q Mr. Quig, is it not a fact that Chemico has never operated any of its SO_2 removal or recovery processes continuously in any integrated large scale power plant?

A That is correct.

• • • •

[2191] Q Now, Chemico is currently—strike that.

Is it not a fact that Chemico, as yet, does not have a contract or firm commitment to build or construct a prototype sulphur recovery unit?

A We do not have a contract.

Q Chemico is presently attempting to secure some financing from the Federal Government to further its development of the recovery process, is it not?

A That's correct.

Q And is it a fair statement that Chemico has no present intent to finance a prototype model of the sulphur recovery process, assuming that the Federal Government is not willing to put funds into it?

A We are engineers and constructors, not investors, so we would build these systems. I doubt at the moment whether or not we would pay for the total cost of a large prototype ourselves, yes.

Q Assuming that funding is forthcoming, at some future time, for a prototype operation, would not the construction of a prototype sulphur recovery system require from 2 to 2 and 1/2 years?

A Yes, that is a fair estimate of the time.

• • • •

[2197] Q Well, are you refusing to answer on the basis that you are not able to make such a statement?

[2198] A I think on giving so-called testimony on nuclear unit operating costs, I don't think I would be an expert witness, in my opinion.

MR. HAUBOLD: Just one moment, your Honor. Just one final question.

THE COURT: All right.

BY MR. HAUBOLD:

Q I am reading from page 14 of Government Exhibit 313, and ask you if this is your opinion:

"Contact over the past two years with utility management has made us think that it would be wrong judgment by fuel suppliers to expect the utility to finance and resolve the total SO_x problem alone. If the utilities are left to develop their own response in achieving ambient air, they may very well trend towards the use of substitute fuels."

Is that your opinion, Mr. Quig?

A Yes.

MR. HAUBOLD: I have no further questions.

THE COURT: Any redirect?

MR. BRAUN: Yes, your Honor.

[2199] THE COURT: All right. You may proceed.

REDIRECT EXAMINATION

BY MR. BRAUN:

Q Mr. Quig, when Mr. Haubold asked you a moment ago whether you believe utilities were willing to finance the recovery process alone, were you referring to the third state of your recovery process as opposed to the removal of sulphur dioxide from stack gases?

A Well, I believe that the utilities would prefer to be removed from financing Chemico's recovery process operations. Whether or not they finance it or not has to be weighed in with their total viewpoint on how they are going to approach their air pollution problems.

Q Have you had over the last several years conversations with utility personnel who are interested in the Chemico process?

A Yes, we have.

Q And have a number of these utilities expended or indicated to you their willingness to expend 2.5 million to build a prototype unit?

MR. HAUBOLD: I object, your Honor, on hearsay. Counsel is asking the witness to speculate as to what the intent of these various other parties are.

THE COURT: Well, he said had they indicated their [2200] willingness.

You may answer.

BY THE WITNESS:

A Yes, we have utilities who have indicated to us their willingness to invest into a prototype SO_2 recovery operation.

BY MR. BRAUN:

Q And what amount of money have they indicated in their willingness to invest?

A It would range, depending on the scope of the work, in the range of 2.1 to 2.5 million dollars.

Q Mr. Haubold asked you earlier about the various load factors of generating stations. Were these factors taken into account in your consideration of the costs of utilizing the Chemico process?

A Yes. The purpose of recovery concept is to avoid the problem of power plant load factor.

Q Now, you indicated on direct that you agreed with the statement that recovery of sulphur would be elusive. Are you prepared to build your disposal unit into a generating station at the present time?

A Yes, we are prepared to bid on that type of a system.

Q Do you believe that your recovery system will [2201] be commercially feasible and operable, based on your professional judgment within the next five years?

A I am sorry, you said recovery?

Q Yes, your recovery system.

A Yes, we believe that.

MR. BRAUN: I have no further questions, your Honor.

THE COURT: Any recross?

MR. HAUBOLD: No recross, your Honor.

THE COURT: All right. Thank you, sir. You are excused.

THE WITNESS: Thank you.

(Witness excused.)

MR. EISEN: Your Honor, I just was going to make a statement and I know the Court admonished us not to quibble about documents. I didn't want to raise it before, but maybe I am quibbling now. Neither one of these gentlemen had these documents before the witness came to town, neither side. I just want the Court to know that.

MR. HEDLUND: I don't want to quibble, but let's get the record straight that this is a Government witness and a man identified him some three weeks ago, and I don't think it excuses them, but I don't want to take the Court's time, but I think the record should be clear.

THE COURT: The documents are in, let's not quibble.

• • • •

[2203] THE CLERK: Case on trial.

THE COURT: Are you ready to proceed?

MR. HEDLUND: We are, your Honor.

THE COURT: Will the witness take the stand.

PETER O. STEINER,

called as a witness by the defendants having been previously duly sworn, resumed the stand and was examined and testified further as follows:

DIRECT EXAMINATION

(continued)

BY MR. HEDLUND:

Q Professor Steiner, as part of your time or responsibility in connection with this litigation, did you yourself or have any of your colleagues attempt to prepare a statistical analysis looking toward the identification of economic, realistically economic markets within the Midwest?

A No, I did not.

Q Did you give defense counsel any suggestions along those lines?

A Yes, I did, a great many.

Q Could you tell me, sir, exactly what you suggested might be done in that respect?

A What I suggested after reading some of the [2204] depositions and hearing some of the testimony, was that it sounded to me as if it would be possible to find identified groups of purchasers who were purchasing coal from identified groups of suppliers, and that there would be perhaps also a situation in which those same customers were among the major group of customers of that same set of suppliers.

I think I am not being entirely clear, but it is suggested to me there might be buyer-seller constellations which could account for a large percentage of the coal consumption of the buyers and, at the same time, a large percentage of the coal sales of the selling groups.

I urged that we look on the basis of the evidence I knew was being collected, that we look and try and identify such groups of buyers and sellers who might appear to be closely related to one another in an economic market.

Q Let me ask you before going into detail, if it were possible to collect such constellations, what, in your opinion, would that indicate?

A Well, if I found a group of customers, let's say, who were buying 80 percent or 90 percent of their coal from one group of buyers, from one group of [2205] sellers, and at the same time those sellers were located in an area and were providing 80 percent or 90 percent of their output to those groups of customers, it would suggest very strongly that there was a strong set of economic factors that linked those buyers with those sellers, and it would make sense to take that group of transactions and treat them as if they were a sensible grouping for economic analysis.

It would be precisely the sort of relevant collection of transactions to treat as a unified whole rather than separately.

[2206] Q Do you have with you, Professor Steiner, what has been received in evidence as Defendants' Exhibit No. 55?

A Yes, I do.

MR. HEDLUND: So that the record is clear, this consists of a series of tables designated as D-1-F to D-3-F, D-1-S to D-3-S, D-1-B to D-3-B, D-1-SO to D-3-SO, D-P and D-X.

BY MR. HEDLUND:

Q Have you made yourself familiar with the contents of this exhibit?

A Yes, I have.

Q By way of example, and without going through the entire document, I would like to direct your attention to Tables D-1-F, D-2-F and D-3-F, and I would ask you to explain what you believe those tables show and what the purport of the information is demonstrated thereon.

A Well, I believe these three tables show that it is possible to define a sales area surrounding the Fulton-Peoria freight rate district, that quite accurately defines a market for Fulton-Peoria coal, the market in the dual sense that I described a minute ago.

Not only did most of the coal go to an iden- [2207] tified group of customers, but those customers also relied very heavily on the Fulton-Peoria producers to supply their needs. The tables are divided as between utility customers and non-utility customers; and the first page relates to the utility facilities utilizing this coal; the second page to non-utility facilities. The third page is a combined summary.

I should say that in analyzing these data, and particularly important with respect to this example, is that it seemed to me and also I think to defense counsel appropriate for reasons we can go into later, if you like, to consider Commonwealth Edison as a separate buying market and to treat it separately for reasons, as I say, that we can go into.

Do you want me then to discuss briefly what I think the table shows?

Q If you would.

A If one looks at the first page of Table D-1-F, we have identified three companies with a variety of facilities there in the Fulton-Peoria sales area which,

if one looks, and this is shown under No. 2 on the first page of this table, that these facilities, when one looks at their total consumption of coal, 87 percent of the consumption of coal of that group of utility facilities [2208] comes from producers in the Fulton-Peoria district.

13 percent comes from producers in other districts as is shown, 13 percent; 12 percent from Belleville and 1 percent from Mineral Atkinson.

It is true for this group of companies they consume a substantial fraction of their coal from a single producing area and virtually all the rest of it from a second area.

Turning it around under No. 3, we see the Fulton-Peoria producers sell all of their coal that goes to utilities in either this consuming area or to Commonwealth Edison.

It is, I think, these particular customers then account—these three utilities plus Commonwealth Edison account for all the utility coal produced in the Fulton-Peoria district and, at the same time, the Fulton-Peoria district accounts for 87 percent of the coal consumed by customers in that area.

Moreover, these customers are geographically related to one another in a definable way. They all have plants along the Illinois River and thus this seems to define both in customer and seller relationships a geographic market area that is determined very largely by this river coal, this barge coal, which much of the [2209] Fulton-Peoria coal is, and that seems to account for it and it seems that Fulton-Peoria utility coal, insofar as it goes to the utility market, is very much less than the state-wide market in a sense.

[2210] The second page attempts in a similar way to treat the non-utility facilities that consume Fulton-Peoria coal and analyze them in much the same way.

No. 1 on page—on table D-2f identifies the specific installations, the number.

The No. 2 on the second page of this exhibit shows that this group of customers are getting 85 percent of their coal requirements supplied to them by Fulton-Peoria producers, and flipping the page, on the third

page, which is table D-2f continued, you see that these utilities—excuse me, these customers defined get 70 percent of the non-utility coal produced by producers in the Fulton-Peoria district. 24 percent is sold to customers in the Chicago air quality control area, a region we have also segregated for what I think are valid reasons, I suspect you will want to go into later, thus leaving out those sales. If one leaves out the Chicago market, 70 out of the 76 percent out of that table goes to this group of buyers.

They, thus, are principal customers of the Fulton-Peoria producers and turning it around, those customers get most of this coal from the Fulton-Peoria [2211] district.

Page D-3f combines them, the utility and the non-utility market, and that shows in summary fashion under No. 1 that taking this group of customers as a whole, of their total coal consumption 86 percent of it comes from the Fulton-Peoria area, 14 percent as there described comes from other areas.

Looked at from the point of view of the producers, 46 percent comes to the identified facilities in that area. Another 45 percent to Commonwealth Edison, which, of course, also is very largely river stations in that area, and another 7 percent is the Chicago air quality control region, thus accounting for the great bulk of the production and thus in this sense, it seems to be an economically sensible matching of a group of customers with a group of producers.

Q There are similar tables, are there not, in Defendants' Exhibit 55 relating to sales and consumption of coal produced in the Springfield Freight Rate District and in the southern or in the Belleville Freight Rate District and in the Southern Illinois Freight Rate District?

A Yes, there are. The next three sections of [2212] this table take the other three districts in which defendants have mines and make similar analyses for each such district.

Q If we were to go through each of those three, I gather your explanation of this would be the same?

A Their structures are precisely the same. The areas are different. The identities of the customers are different, of course.

MR. HEDLUND: In an attempt, your Honor, to make this a little more understandable, we have prepared but will not offer into evidence a map of the general area in which we have been dealing. The cross-hatched on this map represents the Federal air quality control region which is defined in the Code of Federal Regulations as the counties surrounding Cook County and, of course, Cook County itself.

We have also indicated but with only rough geographic proximation, the facilities, generating facilities, coal generating facilities of Commonwealth Edison which are basically Chicago, which include the river stations, Joliet, over in Hammond and Rockford and Dixon and Pekin and Kincaid and up in Waukegan.

I would like Mr. Kempf, if you will, to place on that map the overlay depicting roughly— [2213] well, the overlay with respect to the Fulton-Peoria utilities sales area.

MR. CUSACK: May I look, your Honor? It is the first time I have seen this.

THE COURT: You certainly may.

[2214] BY MR. HEDLUND:

Q Can you see that, Professor Steiner?

A Yes, I can.

Q Does that correspond to what you believe to be a rough geographical representation of the facilities located, that is the generating, utility generating facilities located in the Fulton-Peoria sales area?

A That band, which I remember, goes down the Illinois River and is somewhat wider, of course, than the river itself, but I think that picks up these stations that we identified here as the utility facilities located in the Fulton-Peoria sales area, yes.

MR. HEDLUND: Mr. Kempf, would you remove that and place on the overlay, the Fulton-Peoria non-utility sales area?

BY MR. HEDLUND:

Q Professor Steiner, does this correspond with your understanding of the geographical representation of the facilities in the Fulton-Peoria non-utility sales area?

A Yes. I do not vouch for the exact accuracy of the lines, but stretching in that case west and north from the Illinois River is the area in which each of these facilities that were identified on Table D-2-F is located.

[2215] MR. HEDLUND: Mr. Kempf, would you remove that, please, and put on the overlay with respect to the Belleville utility sales area.

BY MR. HEDLUND:

Q Having done so, now, Professor Steiner, does this overlay correspond to your understanding of the geographical location of the utilities in the Belleville utility sales area?

A Yes, these are the utilities identified by name on Table D-1-B.

They fall in two groups. There are those in the St. Louis area, and the facilities in the St. Louis metropolitan area, and then the Mississippi River stations in Illinois, Iowa, Wisconsin and Minnesota.

MR. HEDLUND: May we have the Belleville non-utility sales area, please.

BY MR. HEDLUND:

Q Again, Professor Steiner, does this overlay correspond to your understanding of the geographical location of the facilities in the Belleville non-utility sales area?

A Yes, the facilities listed in Table D-2-B all fall or at least approximately fall within that area around and south of St. Louis.

[2216] MR. HEDLUND: May we have the Springfield area, please.

MR. CUSACK: I think you should point out for the record that is with the exception of the coal sold to the Greater Chicago Air Quality Control Region.

MR. HEDLUND: Yes, as we define it. That is understood throughout.

THE WITNESS: My understanding is we are excluding the sales to Commonwealth Edison and to the Chicago Air Quality Control Region in every case, your Honor.

THE COURT: That conforms with your understanding?

MR. CUSACK: Yes, your Honor. I just wanted to make it clear.

THE COURT: Yes.

BY MR. HEDLUND:

Q You have now placed on the map the overlay for the Springfield utility sales area, and does this correspond with your understanding of the geographical location of the utilities in that sales area?

[2217] A Yes, it does. These are on table D-1s of the exhibit. They are in that rather narrow band around Springfield itself.

MR. HEDLUND: May we have the overlay for the Springfield non-utility sales area.

BY MR. HEDLUND:

Q Again does this overlay correspond to your understanding of the approximate geographical locations of the non-utilities in the Springfield sales area?

A Yes, it does, a slightly largely perimeter but in the same general area as the utility sales area.

MR. HEDLUND: And the overlay for the Southern utilities, please.

BY MR. HEDLUND:

Q Again, Professor Steiner, does this correspond to your understanding of the approximate geographical location of utilities in the southern utility sales area?

A Yes, it does. This divides into three distinct groups. The group in the northeast of Wisconsin—by the way, some of that is outside—this goes, a good bit of it, to places like Green Bay and Sheboygan, and so forth, and I believe that goes to Chicago by rail and rail to ship and then to the lake [2218] ports.

The second large area west of the Mississippi is, I think, rail coal from the Southern Illinois Freight Dis-

trict, and then there is some in the southern portion of Illinois that is again distinct.

It is possible to identify these clusters of customers for which there was this reciprocal type of relationship.

MR. HEDLUND: And, finally, may we have the overlay for the southern non-utility sales area.

BY MR. HEDLUND:

Q Again, does this correspond to your understanding of the geographical location of the non-utility facilities in the southern sales area?

A Yes, it does, and these areas are very similar, somewhat broader, again, than they—they are the same three basic areas as up here on the utility sales area for Southern Illinois Freight Rate District producers.

Q Now, while I ask Mr. Kempf to replace all of the overlays, I would like to ask you two questions. In the analysis that we have just looked at contained in Defendants' Exhibit 55, do you believe that it was valid or meaningful to separate or hold apart the [2219] shipments with respect to Commonwealth Edison?

A Yes, I do.

Q Would you explain why?

A The dominant reason, but it is only one of two major reasons, is the quantity of coal purchased by Commonwealth Edison for its stations which are shown by the black dots, although there are more stations than there are dots.

If I remember the testimony and the record in this case, Commonwealth Edison purchases between 17 and 19 million tons of coal a year, approximately a quarter of the total coal produced in the State of Illinois. It purchases more than it could purchase from any single district and, thus, its purchases are necessarily spread throughout several, though I think not all, producing districts, if I remember Mr. Corey's testimony.

For that reason, because simply the volume of its purchases and the fact that it of necessity was purchasing in many areas simultaneously, and because it was such a large purchaser, it seemed best to recognize it as an important purchaser but, nevertheless, to treat it separately.

Without it we would have failed to see, [2220] I think, the clear pattern that affects the rest of the purchase of utility and non-utility purchases alike.

The second reason which perhaps justified treating it separately, and even if the other had not been present, is the fact that it is in particular—it appears to be in particular concern of the air pollution regulations in and around the Chicago area, and because it has already made such a heavy commitment to nuclear and to the substitution in a substantial sense of nuclear for coal, particularly in this case for the relatively high sulphur Illinois coal that it has been buying in large quantities, it seems for that reason as well that if we deal with the Commonwealth Edison purchases of coal, it is well to keep them separate to recognize this as a distinct problem as an identifiable sub-market that is worth looking at as a sub-market.

[2221] Q In your opinion, is it valid or was it valid and meaningful to separate the shipments into the Chicago Air Quality Control Region or what is also referred to as the Federal Interstate Greater Chicago Air Quality Control Region?

A I think again for two reasons, perhaps not the same two, but one is similar, these facilities in aggregate are all in this area where air pollution requirements are going to impinge upon them and may impinge quickly.

Many of them, I understand, either have or are considering the use of alternative fuels. In any case, many are concerned with this problem.

It seems well to recognize they had a common set of problems with respect to supply, and while it was necessary to look at their purchases, it is helpful, I think, to look at their purchases, because of their common problems, separately.

Second, in aggregate these are, in the main but not entirely, I believe non-utility users. I think there is one exception. There is one utility company in that area, Commonwealth Edison having been separated, and I think it is Northern Indiana Public Service Company? Other than that, they are industrial users.

[2222] They, in aggregate, have a volume of demand which again requires them to utilize coal from many areas. Because Chicago is the kind of a rail hub that it has been traditionally, the plants in this area are served by rail from virtually all of the producing areas in the state.

I think for that reason, too, it is helpful to regard it as a definable separate sub-market. I think there is insight in that separation.

Q Now, having placed—well, with that background and having looked at these statistics in Defendants' Exhibit 55, and with reference to the combination of all the overlays on the demonstration map there, what have you concluded or what do you believe this analysis shows with specific reference to Freeman and United Electric and with specific reference to the merger here under discussion?

A Well, the choice of these four producing areas is clearly intended to reflect the areas where these two companies have their producing facilities.

The blue color has been used for the southern Illinois and the Springfield area where the mines of Freeman are located.

The red for the Fulton-Peoria and the Belleville area where the mines of United Electric are located.

[2223] Let me start with a couple of negative conclusions. It seems quite clear looking at that graph as well as the data that underlies it, that the talk of Illinois as a relevant market in which to appraise that merger makes very little sense, just in terms of where the coal from the areas in which those companies produce is.

Second, it seems to make relatively little sense to talk of the area that was defined as the Eastern Interior Coal Province Sales Area. It is, I think, interesting, in fact perhaps very interesting, that none of the coal from those four producing districts goes into the state of Indiana.

The reason, I think, is that I think there are substantial coal reserves in Indiana, and we have testimony to the effect that Indiana utilities tend to purchase

coal not from these areas, but from the mines that are closer to them.

The third conclusion is that it seems appropriate to visualize a series of sub-markets that cross state boundaries, none of which, however, are as extensive as the state, which can best be defined in terms of things like river transportation that accounts for, in that case, the Belleville area and the Fulton-Peoria sales [2224] or the particular kind of railroad facilities that may account for much of the shipment of the southern Illinois coal.

Southern Illinois coal, as I read the record, tends to be high BTU coal located on rail facilities. Those things seem to support longer rail shipments than would be supported by the lower BTU coal from the other areas.

In any case, one does have the distinct impression and, as we saw in the statistics, we pick up a great volume of the transactions, but one has the distinct impression of definable sub-markets.

These are not blurred but distinct sub-areas. The overlaps between utility and non-utility suggests that although that distinction may be important in other purposes, it is not strictly important in the geographical delineation.

The blue areas and the red areas very largely do not overlap.

[2225] This again, I think, confirms data that is in the record that very largely the Freeman—that coal from the Freeman mines and coal from the United Electric mines were largely directed to stations that were in different areas, that they were not in close competition with one another.

Your Honor, I recognize—

MR. CUSACK: The Government objects to it on the basis you are misstating the facts and the evidence in the case, just for the record, your Honor.

THE COURT: All right, the objection may be noted.

MR. CUSACK: Thank you.

BY MR. HEDLUND:

Q Would you like to have the last part of your answer?

A I am not sure what I was saying.

MR. HEDLUND: Could you read back the past portion of the witness' answer.

A (Read by the Reporter.)

THE WITNESS: I think I was finished.

THE COURT: You were finished; all right.

BY MR. HEDLUND:

Q Do you recall exactly what evidence in the record you were specifically referring to in talking [2226] about Freeman and the United Electric?

A I think a large number of the customers testified that they considered coal from the Belleville area, that they did not in fact consider coal from other areas and vice-versa.

There was a great deal of this testimony to the effect of users of coal, what they considered to be the relevant sources of supply and the kind of non-overlap that we seem to have identified statistically appears to be confirmed.

There was also a good bit of testimony, I think, to the effect that where there were common shipments to common facilities—

Q You are speaking here of Freeman and United Electric?

A Yes—that some of these could be understood in terms of somewhat different product than was involved.

I am thinking here of the fact that certain stations received coal from the Belleville District and dust from the Southern Illinois District, and the testimony, as I understood Mr. Nugent to talk of it and perhaps some of the other people as well, suggests there were special reasons which would account for that kind of overlap.

[2227] Q You are referring, just for purposes of the record, to Government's Exhibits 88 through 90, that is the list of common customers or of known common customers?

A I was referring generally, but I have in mind that list of common customers which as I recall it, purported to identify the common customers.

When I looked over that list, outside of Commonwealth Edison which was an important customer of both companies, a company which the record clearly shows purchases heavily in the Fulton-Peoria area, in the Belleville and Southern Illinois—

Q Southern Illinois?

A Excuse me, in the Springfield District in those three areas.

Outside of that many—although I would have to go through the list to detail it—of the apparent customers reflected a somewhat different product in this use of dust—are reflected in some cases, as I recall, clearly complementary shipments; shipments for example, I believe on a Freeman contract by United to TVA that was discussed at some length in the record and appeared to be clearly a shipment that was made on the Freeman [2228] contract at the time when the river was closed, so that the coal could not go up and it was done to keep the United mines operating. Clearly, it's the common customers that received a good deal of attention in the record and I have read that record with some interest.

Q Based on all of that then, Dr. Steiner, what is your opinion in terms of the existing mines of United Electric and the reserves of those mines, and assuming that they are all free, and not already committed, what is your opinion with respect to the competition, actual or potential or lack thereof, between Freeman and United Electric?

A To be sure I understand, you are asking me to what extent do I think that the coal in the Freeman area, the coal in the United area, the area of the United mines are—if we assume it is available—are available to the same customers?

Q Yes.

A And I would say on the basis of this evidence, and if the structure of transportation rates and quality of coal continues in the future as it has in the data we have, they appear largely to be non-overlapping for this group of customers.

[2229] Commonwealth Edison clearly is taking coal, to some extent, from both companies by virtue of its pur-

chases in both the Springfield area, from the Crown Mine, and also from both Fulton-Peoria and Belleville. [2230] Q Do you have, Professor Steiner, with you a copy of Defendants' Exhibit 287?

A Yes, I do.

Q For purposes of the record, this is an exhibit of four pages containing four tables, the first of which is entitled "Fraction of Total Illinois Production of Leading Companies other than Peabody;" the second of which is entitled "Average Production per Company, Illinois Production of Illinois Producers;" the third is entitled "Changes in Concentration in Illinois Coal Production since 1959, two measures"; and, the fourth and final is entitled "Changes in Concentration in Illinois, Indiana and Western Kentucky since 1959, two measures."

Did you prepare these tables, Professor Steiner?

A Yes, I did.

Q And on what are these based?

A They are based entirely on the Government exhibits as they are listed and my puzzling through those exhibits although as I indicated earlier, I didn't find the Government exhibits answered all my questions, I thought they might answer some of my questions or some questions and in particular I had some reservations about the definition of product and the inclusion of both [2231] metallurgical and other coal, and so on.

It seemed to me that they might reflect something of the changes over this period from '57 to '67, and particularly they might reflect something to me about the behavior since 1959 in terms of whether the control by Freeman of United Electric, which I date to have taken place in 1959, to see what effect if any, one could see in the concentration as measured by this set of indices, what change had occurred over the 10-year period. Thus what I am saying here is I was trying to take not as indications of the level of concentration for reasons I have indicated earlier, but as some clue to the trend in concentration and see what, in fact, had happened.

[2232] Q Directing your attention to page 1—

A Yes.

Q —I wonder if you would explain, please, what that table shows in your opinion?

A Well, as I said, I think earlier I was struck when I began to look at the list of mergers that were prepared, how importantly Peabody had figured in those mergers.

Q May I interrupt just a moment?

A Surely.

Q When you are referring to the data prepared with respect to mergers, are you referring to anything other than the Government's information and exhibits with respect to coal mergers, which I believe is Government Exhibit 87? Are you referring to the evidence?

A I don't know the exhibit number, but it's the Government exhibit listing the mergers and the acquisitions by companies, showing the acquiring and acquired companies, number of tons and coal and the date that I was concerned with.

In any case, my first intention was concerned with the importance of Peabody in those mergers; and my second, as I looked at that series of exhibits dealing here with Illinois, Exhibits 62 through 72, was the fact [2233] that in the Government statistics the merger between United and Freeman was effectuated in the statistics as of 1967, and this gave a substantial increase in the apparent concentration figures as of that date.

What I first did was to recompute the figures effecting that merger, that is, combining the production—these are production figures—of United and Freeman as of 1959.

Q These are production figures again from the Government's exhibits, is that correct?

A These data are all taken directly from the Government exhibits.

In some cases the percentages may not be the sum of the percentages because I added the actual tonnages, and divided, and I may have made an error.

The computations were made by me. I have checked them. I believe them to be accurate, but although I have here a record, these percentages are in each case computed by taking the aggregate production and dividing it by the total.

In any case, this first table attempts to look at the fraction of total Illinois production by what would be the two largest, the four largest, the six largest and the eight

largest producers then substraticng [2234] out the largest, which was Peabody, so that we could look at the merger trend, Peabody's acquisition, and by this horizontal line drawn between '58 and '59 effectuating that merger in the statistics, for statistical purposes in 1959, what it shows, I think, if you look at it.

Q May I ask this one introductory question before you state that?

A Surely.

Q The title, Freeman, on the second column from the left, that is just so that we are clear, this includes United Electric after 1959?

A That is correct, and Freeman is merged in my statistics here in the 1959 statistics, arguably that perhaps should have been done in 1960 if October '59 was the date, and in any case—

Q Please continue.

A Excuse me.

Q Please continue. I am sorry.

A What that appears to me to show is how remarkedly little, if you like, the market share of these groupings have increased over that 10-year period.

We can see that again in more detail on the third page of this, by just running through it, Freeman, in fact, if you take this definition, has a smaller share [2235] of the market in 1967 than it had in 1959.

The second, third and fourth producers went from 42 percent to 44 percent, over that period.

The top six producers—the second through sixth—missing Peabody, went from 54.7 to 57.8, and so it goes. In other words, remarkably stable percentage shares of Illinois production.

Now, again reserving that I do not really think these are concentration ratios, because I do not think they are in a well defined market for reasons perhaps that show on those maps as well as anything else. That is what this, I think, this table shows.

It also shows between 1958 and 1959 what is the statistical affect of the United-Freeman merger if one effected it as of that date.

Now, it's of course very difficult where you have that period of rise and control to date precisely when statis-

tically the merger should have been effectuated but October 1959 seemed to me the most reasonable date.

Perhaps, Mr. Hedlund, if we turned next to the third sheet, which looks really further at this experience since 1959, the third page, I will come back to the second, the Government in one of its exhibits, perhaps it was No. 70 —I don't remember the number—gave a—that showed [2236] the production of the top two, the top four, and the top ten companies—those Government statistics for these years '59 to '67 are given in the first column of each of the three banks of these three groups of this table.

[2237] I have here picked '59 to '67 because I was particularly concerned with the question, really, as to what if any triggering effect the United-Freeman merger might have had on concentration in the industry, and taking again these figures, not as absolute indications, but as indications of trend.

For example, if we look at the production of the top two, according to Government statistics, it appeared that that had risen from 36.2 percent of the market to 52.9, a total change of 16.7 points, a very substantial percentage increase of the 36.2 in 1959.

The adjustment in the next column consisted merely of effecting that merger not in 1967 for statistical purposes but in 1959. That reduces that 16.7 increase to an 8.7 point increase.

Immediately below that you see that Peabody's increase in market share was 10 points. This, in fact, largely, I think, explains, is explained by Peabody's mergers, these data, I should say, assumes still as within Peabody the tonnages that have been since ordered divested by that other case, so that this has no effect for the subsequent divestiture that might have been made. But that's with respect to the top two of what I believe to be correct, an increase of 8.6 percent—10 percent [2238] more than all of it was accounted for by growth in Peabody; a loss of minus 1.4 by the second company, which of course, was Freeman.

In the second column, the second bank there dealing with the top four, the apparent increase of 20 points in the concentration ratio from 55 to 75.2 reduces to 12

points when one make the merger effective in 1959 as distinguished from 1967, of those 12.1 points, 10 again, the same 10 again are accounted for by Peabody.

This makes the change in concentration due to the activity of the other three, up here, to be relatively modest.

With respect to the top 10, and it was the Government, I might say, who chose 2, 4 and 10 as an appropriate groupings, the changes are less dramatic, but there indeed it turns out that the second through tenth company decreased 1.3; the total increase is 8.7, being more than accounted for by the increase in Peabody's market share.

So it seems to me that those two changes, that is, one effecting the merger date, but I think more realistically, affects the change in control as an economic matter; second, removing Peabody suggests no trend in concentration in Illinois on these statistics as a result of the Freeman-United merger.

[2239] While we are, I did not—I've done on the fourth page here a similar analysis for the three-state area; Indiana, Illinois and Western Kentucky.

Once again to abbreviate this discussion, you will notice that with the production of the top two an apparent increase of 15.5, reduces to 10.7 when you adjust it for the merger. Of that, 12.2 is accounted for by Peabody. Thus, Freeman, the second largest firm and I guess it's not—I don't remember whether Freeman was in every year the second largest firm in that three-state area—that can be checked.

In any case, the top two, their per share decreased. The top four, absent Peabody, their share was roughly constant,—0.8 percent change, which is hardly significant; and the top ten did in fact increase by 5 points; but of the total increase of 17.5, the great bulk again was Peabody.

What I think this suggests to me, those three tables together, suggests that very largely the change in the concentration as measured by the Government and as included in these is partly what I regard as the statistical change, as I would see it, dating of the merger in 1967 instead of—in 1967 [2240] statistics instead of the

1959 or 1960; and second, the very large increase in market share of Peabody.

So, I turn to the second table which really looks at a rather different issue.

You recall that most of those Government statistics, year after year, defined certain leading companies, leading companies in the Illinois statistics were defined as companies with production of 300,000 tons or more in the year in question, and having run down that list there would then be a list of the remaining companies, and we saw that that number of remaining companies declined from something like a hundred-odd down to 29 or 30, as I recall, by the end of the period and I was really rather curious as to what we could find out about the size of the companies that were not specifically listed.

What I did was to compute—and this is really the right-hand column of the second page—I simply took the total tonnage attributed to these non-leading companies and divided by the number of them to find the average tonnage per company.

Now, if you realize that the tonnage that was possible was anywhere between one ton and 299,000 tons, one would expect if these companies were [2241] evenly distributed in that range to find an average somewhere in the neighborhood of 150, 100, 150, 175 thousand tons.

As you will see, those tonnages are very much smaller, which suggests and re-enforces the kind of impression I already had had, that these other than leading companies were in very large part, very small companies indeed, and they were not really in the same kind of market, in the same kind of situation as the big companies.

It is not surprising to me that they, as their market, as I would see it, their market being very largely the spot market, that with this kind of production they were not in position to deal in the utility market nor indeed to be very attractive merger bait for a larger company. There simply was not that much production at stake.

We don't have records or I don't have records of what happened to each of those companies, but I think that this re-enforces the notion that they disappeared.

[2242] One thing I think is of some interest in looking at that, the average size of those companies has increased

somewhat over the years in '57, '54, '57, up to '65, '66, '67. That suggests that even in that group of companies under the 300,000, the attrition appears to have been greater in the smaller companies within that group.

In contrast, if you look at the other side, you see the phenomenon we referred to this morning; the large companies are not only large compared to the dogholes, but they are getting larger over this period. They are getting larger in part, as we saw, because they are dealing with bigger mines, and, of course, included in these things are the facts on such mergers that have occurred and of the Peabody mergers in particular.

Again, in the statistics I have made certain assumptions that had to be made with respect to the Government statistics. I have assumed that UEC and Freeman were merged in 1959 for statistical purposes; this affects not only the tonnage, it affects the number of leading companies, so that when you compute an average you are dividing by a different number than what would otherwise be the case.

I also assume that CW&F was in fact a part of [2243] Freeman in 1957 and in each subsequent year. I think there were two versions of the table of the exhibit I had, and one could go either way as to assume that was merged or was not. It seemed to me from what I knew of it, it was best to assume the merger.

Q Now, Professor Steiner, I would like to turn to your opinion of the effect of the merger of United Electric and Freeman on competition in the markets that we have been discussing.

I want to ask you whether there are a number of factors important in your judgment in considering your decision in making such an evaluation and again with specific reference to Freeman and UEC and if you feel them to be important why.

The first factor I would like to ask your opinion as to whether it is important in making this assessment of the effect of the merger is the nature and the size of the buyers involved.

A Yes, I believe it is important.

[2244] Q Could you tell me why?

A Well, I think when you are discussing a transaction in which a large buyer is devoting his executive talent to the purchase, there is likely to be a degree of market power perhaps, and market wisdom, certainly, that clearly gives for a large buyer and an informed one some protection against being misled and being taken advantage of in any way; thus other things being equal I would think large buyers buying large quantities of coal being well-informed would increase the degree of competition in a market.

Q Secondly, I'd like to ask you what the factors relating to the way in which these purchasers buy coal is necessary to consider in evaluating the effects of this merger?

A By the way in which—do you mean the long-term contracts, the large purchase, or do you mean the fact that these are negotiated contracts for which they take bids, and so on?

Q I mean both.

A Well, I think each is important. I think it's very clear that when a company is making a purchase of coal, let's say for a million tons a year for 20 years, committing themselves to a very substantial [2245] expenditure of funds and indeed often building a boiler to utilize this coal, it suggest that this company will search among its alternatives fully, will explore the possibilities fully, that these things, other things being equal, will tend to give a degree of competitive rigor to the buying side of this market that will put great pressure for conforming with its promises on the seller.

I think secondly the fact from what I understand about it, the procedure of seeking bids, of specifying quantities, of really discussing, not only this fuel of this coal producer as against that coal of that coal producer, but considering as well alternative sources of energy, if one is talking about utility purchases.

Each of these things adds to the degree of pressure on the buying side of the market, and thus other things being equal, adds to the competitiveness of the market.

Q Then taking the next one, do you believe that in evaluating the merger before us that it is necessary to

evaluate the degrees of actual and potential uses of other forms of energy?

A Yes, I do. It seems to me, given the facts [2246] in this case and the testimony of various people, particularly the evidence with respect to TVA and Commonwealth Edison, the fact of nuclear as a substitute for coal in the future, seems established. At what rate that will occur, clearly is a function of relative costs, and of air quality control things. But it seems to me that one must take those into account. It seems to me one must take into account at the present the influence of other forms of fuel, such as gas, and oil.

As I recall, Mr. Corey who testified that approximately a third of their power at certain stations was now being supplied by gas.

In any case, we have had testimony from a number of users that gas is currently playing a significant role.

I take it that residual fuel oil may in the future play this role. To the extent it does, it clearly, it exerts competitive pressure on the market in which coal producers sell their source of energy.

[2247] Q Do you believe, again, in attempting to make an assessment of the effect of this merger, do you believe it necessary to consider the characteristics of the coal producers other than Freeman and United Electric, and, if so, why, and which characteristic?

A Yes, I do. I think that we have here, and it's important that we have here eight or nine substantial companies, or ten, I don't remember the number, producing coal for this market, some of whom are—the number varying—are in a position to bid for demands for coal, requests for bids for coal, for these things.

We have a situation where there are a—I think one witness—I don't remember who it was—spoke of an ample number of companies producing coal, a substantial number of sellers here, is clearly of some interest, is of some interest to me and I would say that other things being equal, having this record of a substantial number of strong companies is a pro-competitive factor in this market.

Q What about reserves of those companies?

A Well, I think that—something that I have been implicit in all my thinking—perhaps I haven't said it as explicitly—we are talking here not about—if we are talking about competition, not about produc- [2248] tion on past contracts, but about the negotiation of future contracts, of contracts for a new production. It is clear that a company, what it has to sell is reserves not previously committed and thus if it is, as the evidence in the case suggests, it suggests to me that United has a very small quantity of uncommitted reserves, then in that case it has a small effect on the market with respect to the use of those reserves, and thus the reserve position is important in the sense that a company, in order to be an effective force, must have sufficient reserves to credibly bid on contracts demanding large quantities of coal.

Q Again, with reference to the evaluation of the merger of Freeman and United Electric before us, is it necessary in your judgment to consider the characteristics of the coal that they sell or each of them sells, or indeed as well the characteristics of the coal sold by other producers?

A Well, yes, I think it is. I think that if one is talking about the sales of coal to an existing facility, the evidence suggests that those facilities, the boilers are designed to utilize coal with certain specifications and within certain limits.

It is quite clear from some of the evidence [2249] that the northern Wisconsin utilities that use high BTU coal were not in a position to use low BTU coal, and so on.

It is clear looking at the statistics that we have that the characteristics of the different coals, different regions, vary substantially, vary in BTU content, in moisture content and in other ways, in sulphur content. I expect the sulphur content may turn out to be a very important consideration and an increasingly important consideration in the future.

[2250] Q You have touched on this briefly with reference to the actual or potential uses of other forms of energy, but I ask you whether again in evaluating the impact of the merger you believe it is necessary to consider the environmental considerations or the air pollu-

tion problems about which there has been such a great deal of evidence?

A Yes, I think I have spoken to this, but let me briefly summarize it.

I think that air pollution considerations are going to make more difficult coal's role in the future. It seems perfectly clear that we are suddenly taking very seriously the matter of air pollution, and that air pollution control regulations will be enforced and that the coal users will either have to find substitutes for coal, find ways of finding a low sulphur coal or will have to introduce techniques for eliminating the sulphur dioxide and other pollutants that come out. None of these, as I suggested earlier, is going to be costless, and by virtue of being costly they are going to make the marginal consideration, let us say, between nuclear and coal closer; for a facility that is not close today, it will be closer tomorrow in my view because of this factor.

[2251] It is a disadvantage under which producers who have high sulphur coal reserves are going to overcome, if they want to sell their coal.

Q With reference to your evaluation, again, as an economist of the impact of the merger between Freeman and United, do you believe that it is necessary to consider the location and the quality of United Electric's reserves?

A Well, I think it's necessary to consider all three: the location, the quantity and the quality.

It is perfectly clear, we have talked about quality, and we have talked about quantity, and that the maps have indicated, the statistics indicate that transportation is a very important cost of the delivering of coal and that, therefore, location is a very important part, and I wouldn't say the most important but a very important aspect of that along with the quality of the control—excuse me,—the quality of the coal.

Q Do you believe it's necessary to consider in your evaluation as an economist the degree of or a lack of United Electric's capability to become a deep coal miner?

A Well, I think that—yes, I do—and I think that is because it relates directly to the reserve issue.

If United does not have sufficient reserves [2252] to be a competitive factor in these markets, one way in which it might be a competitive factor would be to acquire such reserves.

If it lacks underground mining capability, that way is closed to it, and, therefore, it is an important factor in the evaluation.

Q Finally, Dr. Steiner, in your evaluation do you believe it is necessary to consider United Electric's likely success in attempting to acquire additional economically mineable strip reserves in locations meaningful to the market that we have discussed?

A Oh, yes, I do. Obviously, once again, a way for it to overcome its lack of reserves would be to find more reserves, if there are such reserves to be found. If they are not to be found, that is an important factor in evaluating its competitive position.

MR. HEDLUND: Your Honor, I believe I can finish in about 15 minutes if you can go a little bit late.

THE COURT: All right. You may proceed.

[2253] BY MR. HEDLUND:

Q Professor Steiner, considering all of these factors that I have mentioned and even if you will, factors that perhaps I have not mentioned, what opinion, as an economist, have you reached with respect to the effect on competition in the markets we have discussed of the common ownership of Freeman and United in the past?

A Well, as I think I suggested to you for the purpose of this question at least, in my own view, that this merger has been in effect now for a decade.

Looking at the statistics of this from '59 to '67, and the statistics of the industry over this period, it seems to me to have been a highly competitive industry in its preformance and its ability to achieve low prices to respond quickly to a massive set of challenges on it.

It seems to me that the health of this industry is very good in this period, and I would say there has been —that I can find no adverse effect on competition of this merger over this period.

MR. CUSACK: Your Honor, for the purposes of the record, I would like to move to strike the last answer on

the grounds of the Supreme Court decision in the Von's [2254] Grocery case, just for purposes of the record.

THE COURT: All right. The record may so show.

MR. CUSACK: And Pabst and others.

THE COURT: All right.

BY MR. HEDLUND:

Q Considering the factors again that we have been discussing, Professor Steiner, I would ask your opinion as an economist as to the likely future effect on competition in the markets that we have discussed of the continuation of the common ownership of United Electric and Freeman.

A Well, in answering that question, let me make clear that I am assuming, as I believe that United currently has all but a very small portion of its reserves committed to existing contracts, that it is unlikely to acquire large quantities of mineable strip reserves.

Under the circumstances, I believe the continued joint operation is likely to enhance competition in the coal industry because I think it will make for an efficient utilization of the remaining reserves of United in conjunction with the back-ups of Freeman and potentially in terms of utilization of joint efforts of the two companies, so that I think without additional reserves that it can mine it would not be a competitive factor at all, [2255] I think that its reserves, its existing reserves, will likely be effectively utilized under the continued joint ownership. I see no adverse competitive effect.

Q Finally, Professor Steiner, what opinion have you reached as an economist with respect to the likely effect on competition in the markets that we have discussed that would follow from a divestiture from Freeman-General Dynamics of the coal properties and of the company itself, United Electric Company?

A May I ask you in that question, do you assume that where this company has current contracts that include a back-up guarantee by Freeman that that back-up guarantee would continue or would that be removed?

If it were removed, I think there would be some question as to whether it could fulfill even its present contracts, but I can discuss that either way.

[2256] Q I would like you to do that. Would you discuss it both ways?

A I think without such back-up it might well be in serious trouble even in meeting its current commitments.

I am not a lawyer, I don't know the consequences that would follow, what would happen with respect to these existing contracts.

It would clearly, if I understand the record, not be in a position to bid in a substantial way on even one more, if I understand, the nature of its mineable reserves, on one more utility contract because it simply could not give the kind of guarantee of performance, does not have the reserves, and it would not appear to be a credible supplier, on even one more contract.

It would therefore seem to me at best to be a company that was attempting to do its best to liquidate it existing commitments, it would not be a pro-competitive force.

If it had sufficient reserves, let us say, due to back-up guarantees, to commit to its existing contracts, the situation would only be changed in the sense that it would have perhaps no difficulty in [2257] meeting those commitments but still would not be able to enter into additional contracts unless it were in a position to find additional mineable reserves which it had the capabilities of mining. I don't know.

There is one other factor in this that I do not know about. As I recall all of United's coal or virtually all of its coal is high sulphur coal. What will be the status of its contracts, long-term contracts, if sulphur control legislation comes in, I do not know. I do not know. Is this the responsibility of the utility or of the coal company, whether this will void its contracts, and so on?

But it seems to me that is an aspect of the problem that I should think would be unpleasant for The United Electric Coal Companies in the future.

It will be in any case, but it will particularly so standing alone.

MR. HEDLUND: May I just have a moment, your Honor?

THE COURT: You may.

MR. HEDLUND: Your Honor, that is all I have.

THE COURT: All right. We won't start you on cross examination, Mr. Cusack, unless you are in such a hurry to start.

[2260]

IN THE UNITED STATES DISTRICT COURT
NORTHERN DISTRICT OF ILLINOIS
EASTERN DIVISION

No. 67 C 1632

UNITED STATES OF AMERICA, PLAINTIFF
vs.

GENERAL DYNAMICS CORPORATION; THE UNITED ELECTRIC COAL COMPANIES; and FREEMAN COAL MINING CORPORATION, DEFENDANTS

Before HON. EDWIN A. ROBSON, Chief Judge,

Tuesday, April 21, 1970,

10:40 o'clock a.m.

PRESENT:

MR. JOHN THOMAS CUSACK,
MR. ROBERT L. EISEN,
MR. RONALD L. FUTTERMAN,
MR. HUGO SIMS, and
MR. RICHARD J. BRAUN,

appeared for the Plaintiff;

MR. HAMMOND E. CHAFFETZ,
MR. REUBEN L. HEDLUND,
MR. DONALD G. KEMPF, JR., and
MR. RICHARD H. IRVING, III,

appeared for Defendants.

ALSO PRESENT:

MR. CHARLES BANE,
MR. JOHN SARBAUGH,
MR. JAMES M. FOLSOM.

• • • •

[2272] MR. CUSACK: Your Honor, at this time the Governments moves for the admission into evidence of the deposition of Dr. Steiner, which I took last October, together with the deposition exhibits in that deposition.

THE COURT: Any objection?

MR. HEDLUND: No, your Honor. I believe it is already in.

MR. CUSACK: It isn't.

THE COURT: It may be admitted.

(The deposition and deposition exhibits of Dr. Peter Steiner were received in evidence.)

PETER STEINER,

called as a witness by the defendants, having been previously duly sworn, was examined and testified further as follows:

CROSS EXAMINATION

BY MR. CUSACK:

Q Dr. Steiner, you have testified in regard to some national statistics prepared by Bruce Netschert, is that correct, in regard to the coal industry?

A That is correct.

Q Is it your opinion, Doctor, that there is such a thing as a national coal market?

[2273] A No. I believe there is a national coal industry.

Q There is an industry?

A There is a producing industry, and statistics are published by the Bureau of Mines with respect to all American coal producers.

Q In regard to the industry, this is a recognizable industry, with its own trade associations, and so forth?

A Yes, there is.

Q Getting back, sir, to the national coal market—perhaps it would be easier for everyone if we could use Defendants' Exhibit 144—glancing at that, sir, if I can assume that there is no national coal market, which is your testimony—is that correct?

A Would you complete the question?

Q There is no national coal market, correct?

A I think not, but, as I said yesterday, I believe that markets are defined in the context of some question. There may be a national market for coal mining equipment, for example, which is sold to coal mines, something of this kind.

* * * *

[2275] Q Directing your attention to the map of the United States as set out in DX-144, could you tell us, if you know, whether there are any regional markets contained in the nation for the production of coal?

A I think that map reflects the service areas of certain coal consumers and also consumers of other fuels. I don't think that map goes to the question of what is a coal market. I think we have testified, I have testified, to the fact that looking at some of the consumers of coal in this Midwestern area, I think it is possible to define markets for them.

Q What I am asking you to do is to look at the map as an outline of the United States, the Continental United States. You can either ignore or mention the various colors on this map which are the service areas of the public-owned electric utilities. But just having general regard to the map of the United States, could you tell us if you have reached any conclusions in regard to regional markets for the production and sale of coal throughout the country?

A I have not come to conclusions about regional markets. If you look at the map immediately behind you, I have there talked and did talk yesterday about what seemed to me to be definable markets for the sale [2276] of coal.

Q Other than your definable markets based on the freight rate districts in Illinois, which is what this map is talking about, is that correct, sir?

A Could I have that question?

THE COURT: Read the question.

Q (Read by the Reporter.)

BY THE WITNESS:

A I think that is not correct. I think those are based on the analysis of data with respect to both consumption and production of coal, so I paid attention to the identity not only of the location of producers, but also to the location and purchasing habits of customers.

Q All right. Other than that map which you discussed yesterday, the overlay map, having reference to the map of the United States, have you reached any conclusions in regard to any other areas in the country which could be considered proper economic markets for the production and sale of coal?

A I have not analyzed any other markets, Mr. Cusack.

Q Thank you. Would you assume that there are other markets, other economic markets.

[2277] A Yes, indeed.

Q For the production and sale of coal?

A Yes, indeed.

Q It would be something less than the United States, would it not?

A I would be very surprised if for any purpose whatever it made sense to talk about the United States as a whole as being a sensible economic market with respect to coal.

[2287] Q From the period of 1959 to '69, would you have considered United Electric, or do you consider United Electric to have been a substantial coal producer?

A A substantial coal producer, yes.

I do not, if I may just—I do not, over that period, consider it to have been an independent substantial producer, because it is my view, as I expressed it yesterday, that from October of 1959, on, it does not make sense to treat it as if it is an independent coal producer, but that it was effectively under the same control as that of the Freeman Coal Company, so that from my point of view it seems to me that its operations should be looked at in the constraint of which I think was the effective control of its operations.

Q In regard to that, sir, is it your reading of the record that the Directors of United Electric, from 1959

to 1966, when United Electric was merged into General Dynamics and became a wholly-owned subsidiary of General Dynamics, is it your reading of the record that the Directors ran United Electric for the benefit of Freeman and General Dynamics?

A No, sir.

Q Professor, would the future viability of [2288] United Electric in your opinion depend decisively on its coal reserves?

A It would depend—perhaps I can have that question read back.

THE COURT: Read the question.

Q (Read by the Reporter.)

BY THE WITNESS:

A If by "viability" you mean its ability to continue selling coal to customers on contracts, it would depend decisively either on its uncommitted reserves or on its ability to acquire mineable additional reserves.

That is perhaps a definitional answer. I would define "viability" in the market sense as its ability to engage in market transactions. And in that sense clearly what it has to sell, in my view, is reserves, which it either might have or might potentially acquire.

Q Your answer then to my question is "yes"?

A Perhaps if I am to give a one word answer I could have the question re-read.

THE COURT: Read the question.

MR. HEDLUND: Your Honor, I'm going to object. I think the witness has answered the question.

* * * *

[2304] Q And may that also be available to consumers within the Springfield District?

A I think if you are telling me that there is coal of the same general location as the Crown Mine, let's say, in the Springfield District—

Q No, sir. The Crown Mine is at Farmington, which is here (indicating). The Menard, Cass, Morgan, and Sangamon areas is here (indicating). Springfield is there, really between them.

A I am sure there are some, if there were this coal—I am sure there were some consumers of coal to the east of that whole area that you described who would find it possible to utilize that coal. When I say I am sure of that, I would suspect that would be the case. Where they are located or which facilities you are talking about, whether you are talking about utility coal—I think one of the major utilities in that area has a minemouth plant, if I recall. Presumably that coal would still not be competitive with the minemouth plant.

But again I think I need more information, and even with more information I perhaps need more expertise to decide who would be the potential customers of that mine.

[2305] As I think we know, finding which contracts a coal company can bid on requires a good deal of sophistication on the part of the coal mining company, and knowing which coals it can use requires a good deal of sophistication on the part of the purchasing company. I have neither of those sets of sophistication, so I feel at a great disadvantage.

Let me say this: that the statements I have made about markets and market areas have been based not on my knowledge of the inherent logic of certain transactions, but on the basis of the analysis of data that has been made that shows which coal actually goes to which locations. Therefore, it is revealed marketability as distinct from theoretical marketability.

You are now asking me where coals might go, and I don't really know that of my own expertise.

Q Yes. And your overlay chart, then, is it fair to say, is based on 1967 statistics, is that correct?

A Was that the year of the statistics? Whatever the year of those subpoenaed statistics was. Was that 1967?

MR. HEDLUND: We will stipulate that refers to [2306] 1967.

THE WITNESS: Yes.

MR. CUSACK: Thank you.

BY MR. CUSACK:

Q So that would not, sir, account for any shipments from the Carlinville Mine of Humble Oil, the Crater Coal Company to the Powerton Plant at North Pekin, is that correct, sir?

MR. HEDLUND: May I have the question, your Honor?

THE COURT: Read the question.

Q (Read by the Reporter.)

MR. HEDLUND: Your Honor, I don't understand what Mr. Cusack is referring to when he says, "Well, that would not account for—".

THE COURT: Are you objecting?

MR. HEDLUND: I am objecting.

THE COURT: Clarify your question.

MR. CUSACK: Yes, your Honor.

BY MR. CUSACK:

Q The overlay map which we have been discussing, sir, which Mr. Hedlund has testified is based on 1967 production, and the markets set up in the overlay map as well as in the DX-55—is it true that that information would not take into account shipments from [2307] the Carter Coal Company mine at Carlinville, Illinois, in Macoupin County, to the Powerton Plant of Commonwealth Edison at North Pekin?

A I do not recall that there were any such shipments in 1967.

[2308] BY MR. CUSACK:

Q There were none.

A None that I know of.

Q But you do know there was a contract, do you not, for coal to come from Macoupin County to the Powerton plant of North Pekin?

A Yes. I think I remember reading about an agreement, but whether the contract—I haven't read the contract.

Q The evidence in this cause shows that not only Humble Oil, Carter Coal Company, but Freeman owned substantial reserves in Macoupin County. The evidence

also shows that the Macoupin County reserves of Humble, at least some of them, will be sold to the Powerton plant of Commonwealth Edison at North Pekin.

Where would you estimate or would you believe the Macoupin County reserves of Freeman to be developed in the future would be destined?

A I don't believe I can answer that.

Q It is unknown, isn't it?

A It is unknown to me.

Q And you wouldn't know, sir, either, would you where the coal which underlies Cumberland, Coles, Clark and Edgar Counties will go when it is mined, if [2309] it is mined?

A I don't remember in the record sufficient discussion of those coals for me to know enough about their quality or quantity, nor do I know enough about the transportation to make a sensible statement as to where I predict they would go if and when mined.

Q There is evidence in the record, sir, that the Freeman Coal Mining Company is developing at this time its Orient No. 6 mine in the Southern Illinois freight rate district.

A Yes. I am aware of it.

Q Is there any evidence, sir, where the coal mined from the Orient No. 6 mine will be sold?

A Well, it would be my expectation, since, if my recollection is correct, the Orient No. 6 mine is very much like the Orient 3 and 4 mines in its low sulphur properties, and so on, that it would have very much the same potential markets that Orient 3 and 4 mines have, but I could be mistaken on that. My recollection on that testimony is that this is high BTU, low sulphur coal, that it has available to it the same kind of transportation facilities that the Orient 3 and 4 mines have, and therefore I would think without really remembering that it would have very similar conditions of marketability. [2310] Q I would like to now go through with you, if I may, with the leave of the Court, DX-55.

May I have a copy for the Court?

A I will need a copy as well.

MR. CUSACK: Just a minute, please.

May I approach the witness, your Honor?
THE COURT: You may.
THE WITNESS: Thank you for the copy.
MR. CUSACK: Yes, sir.
MR. HEDLUND: Your Honor, can we have just a moment while we get our third copy?
THE COURT: Yes.

(There was a short interruption, after which the following further proceedings were had herein, to-wit:)

BY MR. CUSACK:

Q I would like to go over the DX-55 first with you, Mr. Steiner, Professor Steiner.

First of all, I would like to just establish that the overlay maps that you have been discussing here yesterday with the Court, these maps are based solely on DX-55; is that correct?

BY THE WITNESS:

A That's correct.

[2311] Q And these figures are for 1967?

A Yes.

Q Directing your attention, sir, to Table D-1F, which is the first page here, the utility facilities as located at the Fulton-Peoria sales area, the eight facilities set out under Arabic figure 1 on the first page, this area is not the same, is that correct, as the next page that is Table D-2F, under Arabic 1, the Commonwealth facilities in the Fulton-Peoria sales area; is that correct?

A The areas are not exactly the same I think that is shown on the maps. That's correct.

Q It is fair to say, isn't it, that the known utility facilities in the Fulton-Peoria sales area are much broader than the area encompassing the utility facilities located in the Fulton-Peoria sales area?

A More widely dispersed. I think the utilities are all river stations.

The non-utilities, which involved this list of companies that are there listed, were not all river stations, and

therefore the area that encompassed that volume of sales was a larger area physically, that's correct.

Q And is it true, sir, that in the non-utility [2312] facilities, the sales area as set out at Table D-2F starts with Clinton, Iowa, and ends up with Dixon, Illinois, and isn't it true that there are utility stations located in these very cities?

A There may be. I simply do not know the location of utility stations in Illinois that well, or in these other cities.

Q Well you do know that the Powerton Station of Commonwealth Edison is at Pekin? You know that, don't you?

A Yes, I remember that now.

Is Pekin in this?

Yes, I see it is.

Q And you know that there is a utility station at Clinton, Iowa, don't you? You recall the testimony of the man from the Iowa utility?

A What was his name? Excuse me.

Q Mr. Steele.

A Mr. Steele? If he so testified there is, I'm sure there is a station at Clinton, Iowa.

Q Directing your attention to the first page of this exhibit, Table D-1F, sir, how do you account for the fact that 316,000 tons of coal produced in the Belleville District were consumed by utility facilities [2313] located in the Fulton-Peoria sales area, that is, the facilities of the three companies under the first paragraph, first numbered paragraph?

A Well, I think that—I don't know, without looking at the underlying data, precisely which facility was receiving that shipment of coal.

It would not surprise me in general if I defined two market areas. And if you will visualize those as circles on the map, there might be some station that was in a position to receive from either of those two areas.

I think Belleville coal is, in general, river coal, the coal that can come up the Mississippi River, can fork and go up the Illinois River. And it is possible, though I don't know, that this is the station where coal has

come down river from the Fulton-Peoria mines, and up river from the Belleville mine. And this could well account for it.

I assume that is one possible explanation.

Another is that these may be shipments or contracts signed at different times, and that the particular economics of purchasing coal for a particular station could account for it.

Without going back to the underlying data, [2314] I don't think I can discuss it, discuss it in more detail than that.

[2315] Q Dr. Steiner, Nugent Deposition Exhibit No. 38 shows that the Peabody Coal Company operates the Mecco mine, Mine No. 28 in Knox County.

In which of your districts is the production of the Mecco mine assigned, having reference to your overlay map?

A I think the overlay map did not attempt, Mr. Cusack, to analyze the sales areas for each of the producing mines, or each of the producing districts in Illinois.

It attempted to look at the four producing districts that included the mines of United and Freeman.

Q The Elm Mine of Peabody, is that located in your Fulton-Peoria district?

A If it is in the Fulton-Peoria district, its tonnage is included.

Q Did you take into account the deposition testimony of Mr. Morrison of the Wisconsin utility headquartered at Green Bay in regard to the unit freight rate from the Elm mine, and the shipments of coal from the Elm mine to the Sheboygan, Wisconsin,—

A When you say did I take into account, are you asking me do I remember that testimony?

Q Do you recall that?

[2316] A I'm sure I read it, but I don't recall it at this moment.

Q Having reference to your overlay map and your Fulton-Peoria sales area, if over a million tons of coal a year were moved from the Elm mine of the Midland Division of Peabody Coal by rail on the Chicago North Western to Sheboygan facilities of the Wisconsin Public

Light Company or the Wisconsin Power & Light—I don't remember which—would this somehow affect—would you consider it would be the geographic market for your Fulton-Peoria area?

A Well, there are two things I want to say.

One, in the defining of these market areas it was too much to hope, too much in general to expect that one could account for every ton of coal going out of a particular area to every producer.

On the other hand, in this Fulton-Peoria utilities statistics, as here shown in this exhibit, I do not see any tonnage that is sold out of the Fulton-Peoria area that is going to a facility or utility facility in Wisconsin.

If what you say to me is correct, then there appears to be some kind of a discrepancy between your fact and this exhibit.

[2317] As I think I said to you, I did not, myself, prepare these exhibits. I discussed at some length the theory under which they are prepared. And I think I have every reason to believe that they are accurate.

And I'm puzzled by your example.

Q You did read the deposition of Mr. Morrison, though, did you not?

A Yes, I did. I read all of the depositions, but I simply don't have all of them at my fingertips.

Q And directing your attention, sir, to Table D-1F, is it a fair statement to say that 63 percent of the total coal production in the Fulton-Peoria freight rate district is sold to Commonwealth Edison Company?

A Well, with a couple of minor deviations I think that is what this table shows.

I think that the statistics here, as they were collected, didn't report actually on every ton of coal produced, but only shipments of 20,000 tons or more from specific mines.

These data, as I recall, were developed from the customer reporting questionnaire.

There is a similar table based on the Government's producer shipments. I also looked at those tables. They show very similar, though not identical numbers.

[2318] But with that qualification of the definitions of the coal that is here reported, this appears to say that

63 percent, 3,855,000 tons, was sold to facilities of Commonwealth Edison in 1967.

[2319] Q Based on Table D-2F, sir, in regard to the shipments of the Medusa-Portland Cement Company at Dixon, it is true, is it not, that Freeman ships coal to that facility at Dixon, Illinois, from its southern Illinois mines?

A I simply don't recall, sir.

If so, I assume that will show up on the common customer table which is your own exhibit.

I simply don't recall whether this was one of those—one of those shipments.

Q Directing your attention, sir, to Table D-3F, which is the recapitulation of sales of coal produced in the Fulton-Peoria Freight Rate District—

A Yes?

Q The fourth page of the exhibit, your Honor.

Is it a fair statement to say, Professor Steiner, that a coal consuming facility would attempt to purchase coal as near to its—produced as near to itself as possible?

A I think we have seen a great deal that the purchase of coal is not simply a function of one factor such as distance, that it is a matter of cost per BTU, a matter of sulphur content, of ash properties and so on.

I think that other things being equal, a [2320] mine that is closer tends to have lower transportation costs.

But there is no single metric of distance on this. And we have lots of evidence in the record that shows that some coal travels long distances, coal that goes from southern Illinois up into northern Wisconsin travels a long way. That is not the closest coal. That may be the best coal in an economic sense for those stations to buy.

Q And it may, may it not, also be the only coal available?

A I'm not sure I understand that.

In general as I have understood the record when people have purchased coal they have had several alternative sources of supply when they have purchased coal, had bids from several places.

I think—I can conceive situations in short term, shortages where a company has had to buy all of the coal it could get.

I guess I recall something that Mr. Corey said, that they were buying all of the low sulphur coal they could get. I don't know if he really meant that. I'm sure that had some kind of cost constraints.

I think your original question was did [2321] I think that, without regard to other factors, people always bought the closest coal.

My answer to that would be no.

Q I understand. There are other factors involved, aren't there?

A There are not only other factors involved, but mere distance does not seem to me to be the factor.

Q Right. And in regard to coal availability, there has been some evidence in the case that the reserves of the United Electric Coal Companies have all been sold, which reserves are located in Fulton-Peoria and the Belleville District.

Where are the customers presently served by United Electric, who are unable to get coal from United Electric, where are they going to turn for coal?

MR. HEDLUND: I'm sorry, your Honor. May I have the question back?

THE COURT: Read the question.

Q (Read by the Reporter.)

BY THE WITNESS:

A Well, I think perhaps there are lots of answers to that question for each customer.

I think that if I recall the United Electric contract with Commonwealth Edison has expired, or is to expire [2322] soon. I think we heard evidence that it was not being renewed.

Where Commonwealth Edison is going to replace that fuel, whether it does it by coal, it does by coal from which districts, whether it does it by gas, whether it does by atomic energy, I don't know.

I suppose facility by facility, as any coal contract runs out that utility, that facility has to seek an alternative source of supply. I do not think that the particular plight of United Electric with respect to its uncommitted reserves is mirrored by all other coal companies in Illinois.

So merely speaking about coal, it is not, I think, the question of the general exhaustion of Illinois coal reserves. I think there are lots of companies that have coal reserves; I think there are lots of coal reserves, though my recollection of this is not as clear, there are perhaps a lot of coal reserves in Fulton-Peoria, in Belleville, that are not yet committed, even though United does not happen to own those.

But again it seems to me that the question of where it turns for supply is the central problem facing any customer.

[2323] What we have looked at here is the pattern of where, as of 1967, they had turned for supply, what that seemed to show, which was that there were clear patterns of economically attractive regions of supply, and that these, if one assumed that what people did was because it made economic sense, then one could tell something about the structure of coal markets.

[2324] Q Well, there has been testimony, has there not, Dr. Steiner, that Freeman will back up some of the contracts of United Electric. If that is a fact, isn't it true, then, that the Freeman mines in Springfield, the Springfield district, and in the Southern Illinois freight rate district will serve these customers?

A Well, it shows that it is possible to serve those customers. It may well that if one wants to sell an 18-year supply of coal to someone who needs a 20-year supply, it makes sense to offer to transport up to two years of supply, and this was, after all, back-up guarantee—I take it one is never sure until the last 100,000 tons how many tons one will get from a given mine until one mines it—that even if they have to deliver on that, it may well be that the extra transportation costs on a two-year supply will make attractive a 20-year contract.

So I think it is one thing to talk about a back-up supply, a guaranteed supply, a complementary or supplementary shipment, and another to talk about offering to supply that facility for the whole 20 years, let's say, from the Springfield district or from another district.

Those are in simple economic terms very different matters.

[2325] Q Directing your attention, Professor, to Table D-3F, the recap of the Fulton-Peoria freight rate district, in regard to the total production of coal from the Fulton-Peoria district, 45 percent of the production goes to Commonwealth Edison Company, is that correct, sir?

A If that is what the table shows, and with the same qualifications as before, that is correct.

Q I am not arguing with the numbers. And 7 percent is sold to the Chicago Air Quality Control Region.

A It is sold to facilities within that region.

Q Yes, sir. Therefore, 52 percent of the total coal production of the Fulton-Peoria freight rate district is not contained in what you consider to be the geographic market for that district, is that correct?

A I think I tried to suggest, or these tables have tried to suggest, our concepts have tried to suggest, that there may be several markets, that there is a Commonwealth Edison market, that there is a market defined by non-Commonwealth Edison facilities in the Chicago Air Control Region, and that there is in addition that area on and around the Illinois River which is described in words some place and on the map in the overlay chart.

That coal going to those three regions, as [2326] distinct from other regions, adds up to in that case 98 percent of the production of the Fulton-Peoria coal covered in this exhibit.

Q I would like to try again, if I may. Based on Table D-3F, is it a fair statement to say that 52 percent of the coal produced in the Fulton-Peoria freight rate district is sold to Commonwealth Edison Company or to consumers located in the Chicago Air Quality Control Region and that 46 percent of the production is sold to facilities in what you consider to be the proper sales area for Fulton-Peoria coal production?

A I am with you until we get to the phrase "proper sales area for the Fulton-Peoria region." There is a defined area here, an area defined in terms of a set of customers of the Fulton-Peoria sales area. I am not saying there is anything proper about that concept, anything moral or otherwise proper about it. That is a defined area. It is an area that gets—these facilities get the

great bulk, 86 percent, of their coal from the Fulton-Peoria district. It sells an identifiable set of customers to whom Fulton-Peoria shipped.

[2327] I have no quarrel with the statistics. 46 percent of the coal from Fulton-Peoria goes to that group of customers. As you point out, 45 percent of the coal from that area goes to Commonwealth Edison, 7 percent goes to other Chicago area purchasers.

So if what you are saying is more coal from Fulton-Peoria goes to the Chicago area than goes to these group of customers, the answer to that question is yes. If you are saying something more than that, I don't quite understand what the statement is.

Q Professor, you are not saying, are you, that coal produced in the Fulton-Peoria Freight Rate District that is sold to Commonwealth Edison Company ends up in the Chicago area or that all of it ends up in the Chicago area?

A No. I misspoke, then. Thank you. It goes to stations of Commonwealth Edison. I think many of those are river stations that are in this geographic area.

Q It is a fact, is it not, that coal produced in the Fulton-Peoria Freight Rate District goes to Dixon, Illinois, to the plant of Commonwealth Edison Company?

A I simply do not remember. If that is a fact, [2328] I am sure the record will so show. We have here lumped, and I think of the Commonwealth Edison stations, for reasons I testified to yesterday—I think there are reasons for treating Commonwealth Edison separately. There are enormous demands, among others, which gives them a shipping problem and a scheduling problem as to where to send particular coals.

Q Coal from the Fulton-Peoria Freight Rate District goes to the Rockford public utility, does it not, which is now a part of Commonwealth Edison?

A Yes. I think that Rockford—again I don't remember the details, as to which coal from which area goes to which facility of Commonweath Edison. That can be looked up, and I am sure it is in the record.

Q I notice on page 1 of your exhibit on the Fulton-Peoria District Table D-1F you have excluded 92,000 tons of dust from the Crown Mine.

A Is that a question?
Q Yes, sir.
A It is not my exhibit. I have not excluded, just for the record. This is defendants' exhibit, and they have excluded. I was aware of their decision to treat separately. I think this could have been done two ways. It could have been included in the statistics [2329] and footnoted, or it could have been excluded and footnoted. There is, I think, here complete disclosure of what the facts are. There is from what I understand of the dust situation a distinct difference between dust and other coal; just as it makes sense to segregate different kinds of coal if they are in fact different, it seems sensible to segregate these dust shipments for which we have had testimony that they tended to be used in limited quantities and had special problems with respect to their handling.
[2330] The footnote on page 1, which you have reported, is in fact correct. Those 92,000 tons of dust go from Crown Mine to the Meredosia plants, as I recall, of Central Illinois Public Service.
Q Which is also served by United Electric?
A That's right. This was one of the apparent common shipments that, when I looked at it, turned out to be coal from the Fulton-Peoria district—I forget which mine; perhaps the Banner Mine, but I am not sure which one—of United Electric, and dust from the Crown Mine to this Meredosia plant, which is south on the Illinois River.
Q You would not contest the fact, would you, that dust is coal, would you?
A Dust is a form of coal. That is coal dust is a form of coal.
Q And screenings is a form of coal, is it not?
A Yes.
Q In regard to Table D-1S, which is the analysis of sales to electric utilities of coal produced in the Springfield freight rate district, my understanding is, sir, that for your Springfield freight rate district—and I have reference to your overlay map—you have only two utility facilities, is that correct, sir?

[2331] A I believe that is correct. There were these two utilities which constituted the great bulk of the sale by the Springfield producing mines to utilities other than Commonwealth Edison. These two picked up, as I recall, as the figures suggest here, 16/18ths of the total amount of 1,489,000 tons, with only 206,000 tons going to other utilities.

Q Excluding Commonwealth Edison?

A Excluding Commonwealth Edison, which is here shown as receiving—Commonwealth Edison is clearly the largest customer of the Springfield district.

Q Which is the largest public utility facility, sir, located in the Springfield district?

A Which is the largest public utility facility?

Q Yes, sir.

A I believe that is the Coffeen facility. Is that what it is called? The mine-mouth facility of Central Illinois Public Service.

Q Would it be the Kincaid plant of Commonwealth Edison Company, to refresh your recollection?

A Yes. I think that is correct. I think there is a plant—I think that is correct.

* * * *

[2336]

AFTERNOON SESSION 2:15 P.M.

* * * *

CROSS EXAMINATION

(continued)

BY MR. CUSACK:

Q Dr. Steiner, would you please again refer to Table D-3F? Continuing our discussion on Defendants' Exhibit 55—

A Excuse me. I don't seem to have this at the moment.

Q I'm sorry, sir.

A Just a minute. Yes, I do. I'm sorry.

Q Thank you. In regard to Table D—excuse me—D-1F, which is the chart entitled "Analysis of Sales to Electric Utility of Coal Produced in the Springfield

Freight Rate District," now it is my understanding that the—there are just two utilities, two utility facilities located in what you consider to be the sales area for Springfield, and that is the Coffeen Plant of CIPS, and the Springfield Plant of the Springfield Water Light & Power facility; is that correct?

A Yes, excluding the Commonwealth Edison station that you called to my attention, the Kincaid Station.

[2337] Q Yes, we discussed that already.

Now under column 3, sir, on that page "Springfield Production Sold to Utilities," the column on the right reads "percentage of total production." This is percentage of total production just sold to utilities, isn't it?

Q Yes, sir?

A And it so states.

[2338]Q Now, then, of all the production sold to utilities, 82 percent of it is sold to Commonwealth Edison, is that correct, sir?

A That's correct.

Q Are you familiar with the sales to Commonwealth Edison in 1967 from the Springfield Freight Rate District?

A I am not sure of the sense in which you mean that. I know there were 7.5 million tons.

Q Well, is it fair to say that you know that approximately 5.5 million of those tons were consumed at the Kincaid power station of Commonwealth Edison?

A A very large quantity was. I don't remember the precise percentage.

Q And the Kincaid station is located, is it not, approximately 30 miles south of Springfield?

A I don't know the precise location. It is very close to Springfield.

Q You recall the testimony of Mr. Corey, do you not, sir, in regard to when the Kincaid station was built?

A Perhaps you would remind me.

Q I believe he testified that it was completed, I think, in 1963 or 1964.

MR. CUSACK: Correct me if I am wrong, but I believe it was in the 1960's.

[2339] MR. HEDLUND: I believe the record will

show what it shows. I do not recall. If you want me to take the time to go into Mr. Corey's testimony, I will be happy to.

BY MR. CUSACK:

Q Let us asume, Dr. Steiner, that the Kincaid station was built between 1960 and 1965. Evidence in the record shows that the Mine No. 10 of Peabody Coal Company was built in the early 1950's.

Do you know where the production of Mine No. 10 went prior to the construction of the Kincaid plant in the 1960's?

[2340] A No, I do not.

Q You do not know, do you, that the coal moved on the Chicago and Illinois Midland through Springfield, through Menard County, up to Havana and then by barge to the stations of Commonwealth Edison on the river?

A No. I do not know that. It does not surprise me. I know that Springfield coal has gone to the river and has gone up the river.

Q For many years it is not true that Commonwealth Edison stations in the Chicago area purchased coal produced in the Springfield Freight Rate District?

A I believe Commonwealth has purchased coal in the Springfield District and that this has gone to numbers of their stations.

Q Has this been moved by rail or by barge through Havana, do you know?

A If I recall the testimony, there is at least some place in the record some discussion of some of this going by rail to the river, and I think that must have been at the Havana dock, and sent up the river. There may have been some that went directly by rail as well.

Q You do know, too, do you not, that the Kincaid power station of Commonwealth Edison, located below [2341] Springfield, sends its electricity over high tension wires to the Chicago area?

A I don't know exactly where it sells its electricity. That would not amaze me.

Q You would expect that?

A I didn't say I would expect it. If you say it is so, I would have no reason to contradict your statement that it was so.

Q Your Table D-18 shows that the Commonwealth Edison Company consumed 7,584,000 tons of coal produced in the Springfield Freight Rate District. This would be based, in 1967, from three mines, is that correct, sir?

A I am not in position to tell you how many mines that was from.

Q Do you know of any other mines in the Springfield Freight Rate District, other than the Crown Mine at Farmington and the Peabody Mine at Kincaid, and Peabody No. 10, which is at Pawnee, but is the Kincaid Station?

A Those are the only three that I recall.

[2342] Q And there is another mine on GX Nugent Deposition Exhibit 38 in the Springfield district. It is the Little Dog Mine at Gillespie. You do know, do you not, that that mine is closed?

A I think it was closed in 1967 because of a fire. It is not permanently closed, I think the record shows.

Q Yes, sir. Now, the difference between the coal consumed at the Kincaid plant by Comonwealth Edison and the total Commonwealth Edison production from the Springfield district is shipped, is it not, to Commonwealth Edison's plants in the Chicago area and down the river?

MR. HEDLUND: May I have the question, please?

THE COURT: Read the question.

(Question read by the reporter.)

MR. HEDLUND: I am going to object. I don't believe that question makes sense. I dont' understand it.

THE COURT: I think Commonwealth Edison—you have mixed it up.

MR. CUSACK: All right.

BY MR. CUSACK:

We have established that the Kincaid station of Commonwealth Edison consumes between 5 and 6 million tons of coal. Is that fair to say?

[2343] Or let us assume that it consumes 5 to 6 million tons of coal.

A That is a fair assumption.

Q Very good. Thank you.

Now, then, the remainder of the coal sold to Commonwealth Edison which is produced in the Springfield district moves, does it not, to the other Commonwealth Edison stations?

A It moves to some other Commonwealth Edison stations, yes.

Q Does it move up to Havana? Is this coal shipped to the Havana dock and loaded on barges ?

A I think I testified that I did not know exactly how and where it was shipped. It would not in any way surprise me if it were sent to the Havana station and by barge to a river station of Commonwealth Edison. It would not surprise me either if it turned out it was shipped to some other station. There is a rather complex set of stations, all of whom that burn coal get coal from somewhere. I do not know which station got coal from which mine.

Q What I am trying to elicit is whether or not you recall, and perhaps it would refresh your recollection if I recall to you in the Nugent Deposition testimony that [2344] the Crown mine coal sold to Commonwealth Edison moved on the Chicago & Illinois Midland through Springfield up through Menard County to the dock at Havana, where it was loaded on barges.

Does that refresh your recollection?

A Yes. I remember that. I do not remember whether there was any testimony that other coal from that area moved by another route either to those or to other stations of Commonwealth Edison.

[2345] Q I understand. Thank you.

And we have established, have we not, that the Havana dock is across the river and slightly below it from the Liverpool dock of United Electric, have we not?

A I don't know what you mean by "we have established."

I think it is so located.

Q Well, that is fine. And, of course, you are aware of the fact, are you not, that coal from the—shipped from the Liverpool dock of United Electric, coal produced at the Cuba and Buckhearts Mines does move up the river to the river stations of Commonwealth Edison?

A Yes.

Q Directing your attention, sir, to Table D-28, which is the analysis of sales to non-utility facilities of coal produced in the Springfield Freight Rate District, this exhibit shows, does it not, that there were two industrial accounts which are in the non-utility sales area for the Springfield Freight Rate District; is that true?

[2346] A That's correct.

Q Now perhaps if you could explain this to me, sir, on the overlay chart you have the blue lines for the Springfield District, is that correct, at the center of the map?

A That's correct.

Q And this is a circle, is it not, running from Sangamon County down through Macoupin County, encompassing all of Montgomery County at the eastern part of Shelby County the southeastern part of Macon County, and the southern part of Logan County, doesn't it?

MR. HEDLUND: Your Honor, I'm going to object to this characterization by Mr. Cusack of this, or indeed of that map.

As part of the pre-trial proposed findings of fact we gave a precise geographical location or definition, if you will, of the Springfied non-utility sales area. That was admitted by the Government that this is how we defined it in terms of geography.

The representation here on the map as I understand it, only purports to be a rough general outline of the description that is already in the record as admitted to by the Government.

MR. COURT: Mr. Cusack?

[2347] MR. CUSACK: Well, I want to hurry this up, so I'm not going to look at the finding. I don't even have it handy.

What I'm trying to establish is the general area for the Springfield industrial market.

THE COURT: For the purpose of the record will you accept the areas as defined by the defendants here, with this being a rough approximation?

MR. CUSACK: Yes, as what they purport to be their area, yes.

THE COURT: Yes?
MR. CUSACK: Yes, I will, sure.
THE COURT: Proceed.

BY MR. CUSACK:

Q Based on the Springfield industrial market, have I given a rough approximation in reference to your overlay map?

BY THE WITNESS:

A Well, I have not prepared the maps, nor have I checked them that closely.

I believe that that area includes both of the facilities that are here listed, and that that area as drawn approximates the area as more precisely described in the definitions.

[2348] Q Doctor, my point is this: How can this include an area surrounding the City of Springfield, encompassing large portions of Sangamon, Macoupin, and Montgomery, Christian, Macon, and Logan Counties, and Shelby County, when in fact Table D-2S sets forth only two industrial plants, both of which are located in Decatur?

A Well, I don't know the precise locations of these facilities.

If you want to say to me that there are other facilities in that enclosed area that we have neglected to include, that would seem to me to be a serious deficiency.

When we drew the strip up and down the river, we drew a strip of some thickness, instead of just a line reflecting the river stations.

I think that if what you are saying to me is that the diameter of that circle is too wide then the person that prepared the chart, you know, may be called to be asked why he did that.

I think that what was of concern and of interest there was those industrial facilities which we see here accounted for 93 percent of these non-utility sales from that area, and which accounted [2349] for 83 percent of the purchases of those units. The kind of overlap I spoke of is suggesting a market that they are contained in an area,

rather narrowly circumscribed around the City of Springfield, and that is what this chart says to me. And I believe that is substantially correct.

I believe you are now suggesting that perhaps that area should have been drawn as a smaller circle. And that may well be the case. I do not defend the drafting. I defend the general impression of that as a distinct area that does not overlap with these others.

[2350] Q What I am suggesting, Professor, and I would like to ask you, is it fair to set up a non-utility sales area when it involves sales to two industrial companies, the A. E. Staley Company and Caterpillar Tractor Company, both having facilities located at Decatur in Macon County, Illinois?

A Let me again describe the criterion which were used to try and establish these markets.

The notion was that we would take, try and find, if we could, customers who together consumed a large fraction of the coal produced in that area.

Now, here, taking in this entire Springfield production of all the coal that was sold to non-utilities, 93 percent of that coal went to these two companies, to A. E. Staley and Caterpillar Tractor.

Q Do you mean 83 percent?

A I believe the figure I have says that of the Springfield production—I'm looking at now part 3—of the Springfield production, 93 percent of the non-utility production was sold to the non-utilities in this area, only 7 percent was sold to other non-utilities, and that was in the Greater Chicago Air Control Quality District, Control Region.

At the same time not only did these two [2351] facilities, these two facilities of Staley and Caterpillar account for the great bulk of the non-utility production, but at the same time those facilities got the overwhelming majority of their coal needs supplied by that area.

So it was this 2-way relationship, reciprocal relationship that helped us to define the market in general.

That was the strategy. It was not saying, "Where does the coal go?" It was saying, "Can we find people who buy the coal and take a large part of the coal from that

area, and also account for a large part of their purchases from that area?"

Q Dr. Steiner—

A Thus it might indeed be—I can visualize the situation from where you would have one facility that was buying most of the coal produced in an area, and that was getting all of its coal for that area.

It is not the number of companies that are necessary; it is the fraction of the total coal bought and sold that is at issue.

Q The fraction of the total coal produced is important, is it not?

A I think I just said that I thought it was.

[2352] Q All right, Professor Steiner, look at Table D-1S. This states that the Ceneral Illinois Public Service Company plant at Coffeen and the Springfield Water, Light & Power plant at Springfield consumed in 1967, 1,489,000 tons of coal; is that correct, sir?

A That's correct.

Q And Table D-2S states that the A. E. Staley Company of Decatur, and Caterpillar Tractor at Decatur consumed 344,000 tons of coal in 1967 produced in the Springfield freight rate district; is that correct?

A I believe that is correct, yes.

Q The next table, Table D-3S, shows that the—adding together these two previous figures, which is under the title "Springfield Production Consumed by All Facilities in Sales Area" amounted to 1,833,000 Tons of Coal; is that correct?

A Are you asking me to check the arithmetic?

Q Is that what this purports to show?

A I believe that is what it says.

[2353] Q And isn't it a fact, sir, that this 1,833,000 tons of coal is only 19 percent of the total coal production in 1967 of the Springfield Freight Rate District, which according to Table D-3S amounted to 9,649,000 tons of coal?

A Yes, that is so. And that is shown precisely on that same page. That is at the bottom, under part 2 of the page, we show both that total production and that percentage distribution.

Of that production 19 percent went to these facilities, utility and non-utility.

Another 79 percent went to Commonwealth Edison, of which, as you pointed out to me, over 5 million, 5½ million was also in that geographic area.

The other was to other stations.

And 2 percent represents 232,000 tons, which was sold to all other facilities.

Q Wherever located?

A Wherever they may be. I think we can identify those, if—

Q Professor, on that last page, Table D-8S, the recapitulation of the Springfield sales, you have 70,000 tons coming into your area from Mineral-Atkinson; [2354] is that correct, sir?

A That's correct.

Q Do you know where that is located?

A I believe that is north of Fulton-Peoria, and northeast, I believe—no, I believe it is—my general impression is that Mineral—it is in the north part of the state. I don't remember its precise—

Q Atkinson is in Henry County?

A Yes.

Q Which is north of Fulton-Peoria?

A That's correct.

Q Directing your attention, sir, to Table D-1B, the chart entitled "Analysis of Sales to Electric Utilities of Coal Produced in the Belleville Freight Rate District," under numbered paragraph 2, sir, coal consumption by utility facilities located in the Belleville sales area shows, does it not, sir, that in the area designated by the defendants as the Belleville sales area for utility facilities, 918,000 tons of coal moves into this area, which coal is produced in the Southern Illinois Freight Rate District; is that correct?

A That's correct.

Q And 436,000 tons of coal consumed in your [2355] area moves from mines produced in the western Kentucky field; is that correct?

A That's correct.

Q And 429,000 tons of coal is from the Mineral-Atkinson area; is that correct?

A That's correct.

[2356] Q And 62,000 tons are from the Springfield district, is that correct, sir?

A That's correct.

Q In other words, 21 percent of the coal consumed in what the defendants have designated as their Belleville sales area for utility facilities is produced in other freight rate districts?

A That is precisely, it seems to me, what the table, Table D-1B, says. It says approximately 80 percent is produced in the Belleville area and 21 percent is produced in these other areas.

Q Again, sir, discussing Commonwealth Edison Company, are you aware of the coal produced by the Captain Mine of Southwestern Illinois Coal Corporation?

A Yes, I am.

Q Which coal moves on the Gulf, Mobile & Ohio Railroad Company, through Springfield, Illinois, to the Will County station of Commonwealth Edison Company?

A Yes. Would you like me to speak generally on the problem of Commonwealth Edison and its coal purchases?

Q No. I will go into that later, if I may, with leave of the Court.

THE COURT: You may.

BY THE WITNESS:

A Well, I think—

[2357] THE COURT: Answer the question. Is there a question?

THE WITNESS: Am I aware of it? Is that the question?

BY MR. CUSACK:

Q Yes.

A Yes, I am aware.

Q You are also aware that it moves through Springfield, Illinois, on the GM&O and then north to Will County?

A I was not aware of the precise routing of that coal.

MR. CUSACK: Will counsel so stipulate, that the coal on the Gulf, Mobile & Ohio Railroad moving from the Captain Mine of Southwestern Illinois Coal Corporation moves on the Gulf, Mobile & Ohio through Springfield and north to Will County?

MR. HEDLUND: Yes, if counsel will stipulate that this is a unit train movement in a train that never stops.

MR. CUSACK: I will stipulate it is a unit train movement. I don't know whether the train stops.

THE COURT: I think that is a fair assumption. Will you accept that condition?

MR. HEDLUND: I need not mean to say that it didn't stop to unload. What I meant to say was that that was [2358] the only reason that it stopped. It is a continual movement, your Honor.

THE COURT: All right.

[2359] BY MR. CUSACK:

Q I have forgotten one thing, Professor. The first page of Table D-1B—we were discussing your Belleville District, consuming district, and we found out that 918,000 tons sold in this district comes from the Southern Illinois District. This excludes, does it not, 970,000 tons of dust produced by coal mines in the Southern Illinois District, does it not?

A Again, if I may disclaim it being my exhibit, the footnote says it excludes that dust. I have no reason to think the footnote and therefore the exhibit is wrong.

Q I understand. Thank you.

Now directing your attention to Table D-1B, continuing on the second page of that, sir, it is fair to say, then, that 6,526,000 tons of coal produced in the Belleville Freight Rate District in 1967 was sold to Commonwealth Edison Company, is that correct?

A That is what the table says, yes.

Q Which is 40 percent of the total production sold to utilities, is that correct?

A That's correct.

Q And this coal is not consumed at the Powertown [2360] Station of Commonwealth or at the Kincaid Station, but is consumed at the river stations of Commonwealth Edison Company, isn't it?

A I do not have at my fingertips the precise destination of that coal. I think that must be the same coal you were talking about a moment ago that went on this unit train, the train shipment; which facility or facilities consumes that I do not remember.

MR. HEDLUND: I might add, your Honor, this is all in the record.

BY MR. CUSACK:

Q Directing your attention to Table D-B2, is it a fair statement that 24 percent of the coal produced in the Belleville District sold to the non-utilities is sold in the Greater Chicago Air Control Region?

A That is what this table shows, yes.

Q So that coal moves from the Belleville District, which is directly to the west and slightly to the north of the Southern Illinois District, to the Chicago area?

A That's correct.

[2361] Q Looking at Table D-3B, the recapitulation, it is a fact, is it not, that 46 percent of the coal produced in the Belleville freight rate district in 1967 was sold either to Commonwealth Edison Company or to facilities located in the Greater Chicago Air Quality Control Region?

A Yes.

Q In regard to Table D-1SO, which is entitled "Analysis of sales to electric utilities of coal produced in the Southern Illinois Freight Rate District," there is a listing, is there not, here, sir, of the utility facilities located in your southern sales area?

A In the southern sales area.

Q This is based on 1967 coal production, sir, is it?

A That is my understanding throughout this whole exhibit.

Q None of the coal in this area, as far as this exhibit shows, moved to any of the facilities of the Union Electric Company, is that correct, sir?

A No. I believe Union Electric Company is listed in the facilities.

Q Excuse me. Yes. Well, then, would Union Electric service area be part of your southern Illinois district? [2362] A I think that the Union Electric facility, the Sioux facility at West Alton and St. Charles, if I read this correctly, in Missouri, is included in that district, yes.

I think there are a number of facilities of Union Electric, and it is that facility—again, I don't have a terribly good memory, but it seems to me that is a rail facility that sends coal by rail from southern Illinois to that facility as distinct from other facilities of Union Electric which receives barge coal from the Belleville area.

Q And the Belleville area traditionally, does it not, serves the mines of the Union Electric Company—excuse me,—serves the generating stations of Union Electric?

A Some of them.

Q You know, do you not, that the Orient mines of Freeman in the Southern Illinois Freight Rate District now have a contract to supply the Sioux plant at Alton, isn't that correct?

A I am not sure if that is correct or not. There are so many sales data I have forgotten, and I am embarrased to say that is one of them.

Q I believe Mr. Nugent testified in his deposi- [2363] tion on it—

A If he so testified, I am sure that is correct.

Q The Table D-1SO is continued on the second page, and on the second page you have sales to utilities in your sales area amounting to 7,987,000 tons, and then sold to Commonwealth Edison, 137,000 tons, and you have sold to other utilities 1,714,000 tons.

Do you know, sir, which other utilities this would be referring to?

A I think I have a list of them, if I may look at it. [2364] MR. HEDLUND: Your Honor, in the interest of time, we would be more than happy to put into the record that list.

THE WITNESS: There are large lists of these.

BY MR. CUSACK:

Q Would you please read them off? It might expedite this, your Honor. I wouldn't have to go into it any further.

THE COURT: Mr. Hedlund agrees to stipulate that whatever is on the list, showing whom they are sold to, will be incorporated in and will be made a part of the record, unless you want to have it read off.

MR. CUSACK: There are about ten names, your Honor.

THE COURT: All right.

BY MR. CUSACK:

Q Would you answer?

A I think one of the problems is that that 1,714,000 tons of coal will divide into two parts. The list I have here is 946,000 tons of coal that are sold to facilities which I will be glad to read, if you like, that are in none of the four sales districts. There are other facilities—this coal has appeared elsewhere. You will recall there is some Southern [2365] Illinois coal that went to some customers who were in other districts.

Q Yes.

A I do not have that specific list, but I can give you the list of about 946,000 of those tons.

Q Fine.

A If I can read you this, I think some of those sales went to American Electric Power in Mishawaka, Indiana; some to Central Illinois Public Service Company in Huntsville, Illinois.

Q Do you know where Huntsville is located?

A Well—

Q Never mind.

A No, I don't.

Q Go on.

A Some of that coal—this is utility coal.

Q Yes, sir.

A Some went to Illinois Power at Vermillion-Oakwood, Illinois. A substantial amount went to the Clifty

Creek facility. That was that Ohio—Mr. Ward, was it, who testified to that facility that provided power to the Atomic Energy Commission. Clifty Creek, Indiana.

Q Is that in southern Indiana?

[2366] A I believe it is in southern Indiana or conceivably in Kentucky. I think it is on the Ohio River. Some of that went to Rochester Public Utility, in Rochester, Minnesota; some went to something which I don't know, called the Rochelle Light & Power in Rochelle, Illinois, which is perhaps a municipal plant.

A substantial amount—well, not substantial—some amount went TVA in Johnsonville, Tennessee.

Q How much would that be?

A In this list that is 68,000 tons. Some went to Wisconsin Power & Light in Beloit, Wisconsin.

Q How many tons was that?

A That is a small shipment, 22,000 tons.

But these details are available in the printouts. This is a hand tabulation of some of that tonnage, because I was curious to see where in fact it did go. It goes to a variety of the locations.

[2367] Q In Indiana, Wisconsin, Illinois and Minnesota, right?

A Tennessee, Kentucky. Kentucky, I think, is to something called Louisville Gas Company. A variety of locations. This southern Illinois coal goes to a lot of places.

Q Just for purposes of the record, the Clify Creek facility in Indiana gets 207,000 tons, is that correct?

A That is what this says.

Q And the Huntsville plant gets 253,000 tons, is that correct?

A That is what this says.

Q And the Mishawaka, Indiana, facility of American Electric Power gets 69,000 tons, is that correct?

A That's correct.

I think Clifty is called the Ohio Valley Electric Association. That is, the operator of the Clifty Creek plant.

Q In regard to the recapitulation, Table D-3SO, this shows, does it not, that all the coal consumed by all

facilities in what is purported to be the southern sales area—of that 42 percent of this coal is produced in west Kentucky, Mineral Atkinson, Belleville, Indiana, [2368] Murdock, Springfield, and Fulton-Peoria, in total?

A I think a negligible amount in Springfield and Fulton-Peoria. Most of that, 34 percent, is from west Kentucky.

May I say that from all of these areas, the one that was least satisfactory, in a kind of reciprocal analysis that I wanted, was the Southern Illinois area. It is clear there is a great deal of overlap between southern Illinois and west Kentucky. A lot of that coal goes into west Kentucky, partly because it goes to TVA stations in the west Kentucky area.

So I am not sure, if I were drawing it, that I wouldn't think of a market area that merged some west Kentucky with some southern Illinois. The west Kentucky fields seem to have a substantial overlap.

Q You have testified that the west Kentucky field, the west Kentucky sales area, I mean, is in Wisconsin, is that correct?

A No, sir.

Q Excuse me. Strike that. You testified that the southern Illinois sales area is in this eastern portion of Wisconsin, is that correct?

A Southern Illinois coal is heavily concentrated in three areas. One area is that northeastern section of [2369] Wisconsin, the blue wedge. Another section is west of the Mississippi River, that large blue balloon. A third area is down in that tri-state area, TVA, which includes Cape Girardeau. We can look at the facilities by name. Particularly in that area, as you can see, which involves Missouri, Indiana, Illinois, in that corner, that four-state area, west Kentucky coal goes into many of those same facilities.

It is that fact, I think, which results in all of these areas we have looked at, where the southern production consumed by the southern area, in the sales areas only, accounts for 56 percent, as you have pointed out—I thought perhaps it was 58, but I am not sure—I think it is 56 percent of the consumption of the facilities in

this sales area comes from there. The rest come in great bulk from west Kentucky.

I believe there is just a mistake in addition on that table.

Q Which one is that?

A I believe where it says 42 percent, it should be 44 percent.

[2370] Q On Table D-3SO?

A That's correct. I think the 56 percent is correct. I think the sub-totals are correct—34, 8, 3 and 1. But I think that adds up to 44 percent.

MR. CUSACK: Will counsel stipulate to that correction?

MR. HEDLUND: We certainly will.

THE COURT: All right.

MR. CUSACK: And may the chart so show?

BY MR. CUSACK:

Q In other words, you have 44 percent from the other producing districts and 56 percent from southern Illinois?

A That is correct. But I think that unless one recognizes that 34 of the 44 is from west Kentucky, one—the real question, and the question I confess I had and still have, is whether one should have defined instead a combined southern Illinois—west Kentucky area for this utility, for the purpose of these utilities.

Q Would you have defined a combined southern Illinois and Fulton-Peoria district?

A Southern Illinois and Fulton-Peoria?

Q Yes, sir.

A No, I would not.

• • • •

[2376] Q And Commonwealth Edison Company, does it not, sir, have coal-fired generating stations located south of Springfield, south of Peoria, at Dixon, Rockford, Will County, near Joliet, Waukegan, Chicago, and on the Illinois-Indiana border at State Line; is that correct?

A They have a number of facilities. I think the record will show where they are.

Those dots on the map purport to indicate the major collections of them.

Q So it is your view then that Commonwealth Edison Company no matter where its stations are located, is the separate geographic market; is that correct?

A I think you are trying to put words in my mouth.

I think that the Commonwealth Edison Company, by virtue of the quantity of coal it purchases for its power stations and the particular problem it has, and the problem it has of getting enough coal for each of its coal-fired stations is better considered as a separate market than being lumped in with some of these other markets.

[2377] Q And is it a separate market, sir, because of its size?

A Well, I think that size is one of the things that makes it sensible to treat it separately.

I suggested that its heavy involvement in nuclear energy was the second reason perhaps why it might make sense to treat it separately.

Q Based on your professional experience—

MR. HEDLUND: Just a moment. I'm not certain that the witness was finished with his answer.

THE COURT: Did you finish your answer?

THE WITNESS: Not quite.

THE COURT: All right, continue.

MR. CUSACK: Excuse me.

BY THE WITNESS:

A I think I was saying that it's particular concern with nuclear energy, and its particular sensitivity to the air pollution pressures that at least are partly responsible for its interest in sources of energy other than coal, all of these things make it a rather distinctive case, and one that it seems to me sensible to treat as a separate economic market.

* * * *

[2380] A I think one can think of numbers of situations [2381] in which the presence of a dominant firm so affects the whole picture of the way in which an industry behaves that it may be sensible to treat it separately.

Again I want to talk as an economist, and not as what I am not, not a lawyer. I'm trying to remember—

I have just the faintest glimmer that in one of the California bank cases there was some discussion of treating the market absent Bank of America on the grounds that Bank America with its multiple branches was so large a factor that to include it would distort the picture.

[2382] Q Do you—

A But there are various situations, cases in which—the Shoe Machinery is one in which a single firm was held so to dominate an industry that to treat it as if it were a separate force seemed appropriate. I think there is no rule here as to what makes better sense. One asks, really, whether separating or combining a particular dominant firm—in this case a dominant coal purchaser with others—but in a situation where the combining the firm with others provides more insight than keeping it separate.

Here it seems to me that keeping Commonwealth Edison Company as a purchaser of fuel separate from the other utilities in this area makes more sense than to combine it.

Q Well, Professor, the Shoe Machinery case was Section 2, Sherman Act monopoly case, wasn't it?

MR. HEDLUND: I object.

BY THE WITNESS:

A I was not talking—I'm sorry.

I was not talking to the legal aspects. You asked me as an economist did I think it made sense.

There are people who manufacture these machines.

* * * *

[2384] I think that this kind of area of division which I have testified to, which seems to me a sensible solution, that their mines are in largely non-closely competitive producting districts. I think in one sense, [2385] of course, all producers of energy are in an energy market. Both of these coal companies, along with other companies, are concerned with supplying energy.

I think that in terms of the question that I believe is of central concern, these companies are very largely not in close and direct competition for particular customers with a significant exception of Commonwealth Edison.

Q Concluding with some questions—concluding my questions on DX-55, I just have a few more to ask you.

DX-55 is just for 1967; that is correct, isn't it?

A That is my understanding.

Q Dr. Steiner, is it fair to construct any sort of a geographic market or markets based on data for only one year?

A It is better than data for no years.

I think what you—

Q I believe you have answered the question. Thank you.

You have ignored, have you not, in DX-55—your Honor, may I confer with my counsel on the Elm mine situation?

THE COURT: You may. You may.

* * * *

[2387] THE CLERK: Case on trial.

THE COURT: Are you ready to proceed?

MR. CUSACK: Yes.

Your Honor, we have a stipulation based upon examination of the Morrison and Abrahamson deposition. Based upon those, we stipulate that the new unit at the Edgewater Utility at Sheboygan, Wisconsin, the largest coal-fired unit in the State of Wisconsin, owned by Wisconsin Power & Light and Wisconsin Public Service Company, will receive by unit train in utility-owned cars costing $16,000 each up to one million tons per year for 15 years with a ten-year option, with Peabody Coal Company, for coal to come originally from Fulton County, Illinois.

THE COURT: Is it so stipulated?

MR. HEDLUND: We so stipulate that that is what the record shows.

THE COURT: All right.

BY MR. CUSACK:

Q Now, Professor, based on that stipulation and based on your prior discussion of DX-55 and your construction of markets on that basis, you have, have you not, not taken into consideration that stipulation which we have just stated?

[2388] A Obviously—

MR. HEDLUND: I'm going to object to the phrasing of that question on this basis: This data was 1967; this refers to something following that period. With that

understanding, I would not object to the question.

THE COURT: Is that agreeable?

MR. CUSACK: Yes, your Honor.

BY THE WITNESS:

A This sounds to me, Mr. Cusack, like one of those things that the record suggests is possible, where a facility is geared to a mine and a rail shipment. If I understand that stipulation, and I heard it just once, one has here a facility that is built—

[2389] MR. CUSACK: Your Honor, I request that the witness answer the question.

BY MR. CUSACK:

Q My question, and I will rephrase it if you want me to, and with the permission of the Court—

THE COURT: You may.

BY MR. CUSACK:

Q Your DX-55, sir, does not take into account any shipments after 1967.

A That is correct.

Q And your DX-55, sir, does not take into account any shipments prior to 1967, isn't that correct?

A DX-55 is based on 1967 data.

Q And you also have ignored, even in 1967, sir, the production of the Mecco mine of Peabody, which in that year produced 1,248,000 tons of coal; isn't that correct?

A I don't know that that is correct.

Q As shown by Kolbe Deposition Exhibit 19.

MR. CUSACK: Will counsel so stipulate, that DX-55 does not take into account the production of the Mecco mine of Peabody?

• • • •

[2396] Q Is it possible, sir, to define any geographic market for the sale and distribution of any product, or even need for the production of any product with much exactitude?

A I have heard your question, but I don't believe I understand it.

I think there is some approximations to markets, some estimates attempted to delineate them that seem to me more sensible, more accurate than others.

I do not think, except in very rare cases, one would be able to define a perfect market definition that meets everyone's criterion of what was desired. But I think there are reasonable approximations, and one does the best one can.

Q Is it possible, sir, that by limiting data selection to a single year to arrive at a distorted picture of the market?

A Are you asking me if it is possible to deliberately distort a market by limiting attention to a single year?

Q No, sir, not "deliberately" at all.

A Are you asking me if the data for a particular year might possibly be quite different in another year?

The answer, of course, is that they might be.

[2397] I have no reason to think that these data are particularly a biased selection of year.

I think, as an economist, I would have been very pleased to see the same data collected year by year for 40 years, and we could have traced the way in which the markets change.

I do not, within the context of what you would call reasonable estimations, whether taken from the customers' statistics or producer statistics, which I understand were collected in the same discovery procedure, I don't think that either one of those sets are inherently suspect because they are of a single year. I think there is a great deal of information in the testimony that we have heard in this case, there seems to be substantial stability in coal buying partly because of long-term contracts, in part because of repetitive attempts to get coal from particular areas by particular utilities.

MR. CUSACK: May I have a conference with the witness on Defendants' Deposition Exhibit No. 36?

(There was a short interruption, after which the following further proceedings were had herein, to-wit:)

• • • •

[2411] For me to go further and to say that these [2412] mines are with respect to most of their customers or with respect to a substantial number of customers, a very substantial fraction of all customers, in the same market is a very different question.

I have in mind here that I could visualize two quite separate markets that had an area of overlap. In that area of overlap a customer located in that area of overlap might well be reached from either one of the separate markets. That would not, by virtue of finding that overlap, suggest that there was a total identity of the two markets.

Q Is it true that a coal consumer might negotiate with a number of coal producers before locating a coal consuming facility?

A I think it is not only possible; I think the record shows that this has happened.

Q In such a case, then, the location of this facility would not reflect the actual competition between coal suppliers that occurred before that facility was located there, isn't that true?

A May I have that question?

THE COURT: Read the question.

(Question read by the reporter.)

[2413] BY THE WITNESS:

A No. I think it would reflect it. I think that a customer attempting to locate a facility, considering several possibilities in terms of different coals or several possibilities including different fuels, would consider the site of what it considered the possible and relevant suppliers, and I think, having once chosen one, that what that would suggest is that he found that particular supplier in that particular location to be the economically best solution for him as of the moment of that decision.

In that sense, it seems to me it does not, and perhaps this is what you had in mind, show by itself which alternatives he considered; but it shows which alternatives he selected.

MR. CUSACK: May I confer with my colleagues for a moment?

THE COURT: You may.

(There was a short interruption, after which the following further proceedings were had herein, to-wit:)

* * * *

[2423] REDIRECT EXAMINATION

BY MR. HEDLUND:

Q There was reference in your cross examination both with respect to—well, particularly with respect to Commonwealth Edison.

I would like to ask you to assume that the coal at a mine in Fulton County has a higher BTU than coal from the Springfield Freight Rate District, and I would like to ask you—I would ask you to assume that this coal from Fulton County to a dock opposite Havana costs about 10 cents or so per ton to deliver it to that dock; and I would like you to assume that the freight rate from the mine in the Springfield District was 85 cents or thereabouts to the Havana dock, and that beyond the Havana dock to the river stations of Commonwealth Edison the barge rate is the same.

Then I would like you to assume that Commonwealth Edison has purchased coal from both such mines to burn in the same stations.

First of all I would like to ask you if you can conclude why they do that, and if you would have an explanation for it?

A If I understand the figures you gave me the coal from Springfield is 75 cents more expensive in terms of shipment, and is, at the same time, a somewhat low BTU per ton. That suggests—is that correct?

[2424] Q That's correct. And I believe—well, yes, that is correct.

Just for purposes of reference, I believe Mr. Nugent said that 100 BTU differences is worth about a nickel a ton.

A Clearly in that case, if that station of Commonwealth Edison were in a position to acquire all of its

supplies—I also assume that there are no other differences in the coals that we haven't specified?

Q That's right.

A I would assume that if they are in a position to acquire of its coal from that facility, from the Peoria-Fulton District, it would have done so; it would have saved transportation costs, and gotten more energy per ton as well.

I would conclude, I think, that it went to the more expensive source of coal because it simply could not satisfy all of its requirements at the lower price from the Fulton-Peoria area, that because of its total demands it needed more coal than it could get in one area, and therefore that it had been pushed into acquiring a secondary source of coal for that plant.

Q Mr. Cusack inquired about everything else being equal would not a coal customer prefer to [2425] purchase coal from a mine closer to it than one farther away.

Is it always true as a principle of economic theory that what one might intuitively expect to be the most economic purchase in a situation where proximity is important, that one would expect to go to the closest facility rather than the fartherest facility, that intuitively you would expect that, but when you analyze it that the opposite is true from an economic standpoint?

A That is a well-known theorem. It is called the transportation problem in economic theory, a problem that is—perhaps I can illustrate it this way:

If a company has, let us say, three producing locations and ten selling locations, its problem is to decide which plant in each case ships to which selling location, so as to get the right quantity of output at each selling location in such a way as to minimize its total freight rate.

Now that turns out to be an involved program in something called linear programming. It is a problem that has been solved as a practical matter for large companies in part because of the [2426] introduction of computers.

Kimberly-Clark is one example that I know of that utilizes now this kind of analytical scheme to figure out

what is the best way in which the supply from the various factories goes to various distribution points.

In this connection, for example, it is quite possible that if, let us say, Commonwealth Edison has one station near Chicago and another near Springfield, and it needs coal both from the Springfield area and from the southern Illinois area, or from the Belleville area, let's say, it might be efficient in terms of minimizing its total coal bill to ship coal from right next to the Springfield plant to the Chicago area, and coal from Belleville to the Springfield plant.

I take that as a purely hypothetical thing.

What one is concerned with in this case is allocating a number of shipments from a number of sources of supply to a number of facilities in such a way as to minimize the aggregate transportation costs. And that turns out, by the way, to be a tremendously difficult problem to set up and solve analytically, even with the aid of modern mathematical models and [2427] moderate size computers. This is done quite routinely for a number of different enterprises. I have no idea if Commonwealth Edison uses that sort of technique in analyzing its fuel costs, but it wouldn't surprise me if it did.

* * * *

[2428] Q Mr. Cusack asked you, or made reference to your discussion of the coal industry in your textbook. [2429] Is there a difference between an industry and a market?

A It is a distinction that is usually made to refer to an industry as a—some description of a set of producers, and thus the standard industrial classification involves a great many—either in terms of a set of producers, or in terms of a specified product, a product like coal.

There is a coal industry in the statistical sense. There are a set of producers who produce coal who have, as Mr. Cusack reminded me, publications and trade associations and that sort of thing.

Having said that, we have not yet come to the question which I talked about at some length—was it yesterday—as to the definition of a market for the purpose of

analyzing a particular question that occurred in a market.

Competition occurs in a market.

Production occurs in an industry.

MR. HEDLUND: May I have just one moment, your Honor?

THE COURT: You may.

(There was a short interruption, after which the following further proceedings were had herein, to-wit:)

* * * *

[2437] THE COURT: Now, in your analysis of the coal industry as we find it here in illinois and as posed by all of the facts that have come in in this case, is there anything about it that does not make it susceptible to the same criteria in judging the competitiveness of the market as it does in industry in general, that is, the industries that you have studied?

THE WITNESS: I think the same kinds of considerations pertain. I think there are some specific differences. I think in this case what seems to me the importance of reserves as distinct from production is an index of strength. I think that the great importance of physically very different competitive products, like nuclear energy, is somewhat a special feature. But not in principle different.

I think that the fact that the coal industry in some senses is fighting for its life with this air pollution thing gives some different overtones to the general problem of the set of pressures that faces them.

I think the fact that this is an industry that sells almost all of its products to very large, [2438] very well informed buyers, importantly conditions the way in which this competition occurs.

I think all of those things also are present in more or less degree in other industries. I think here again something that is important just because it plays such a large role in this case is the tremendous importance of transportation costs. The greater the transportation costs as a function of total delivered price, the more important it is to look at location and transportation routes in determining which sellers are generally in competition

with others, so that I suppose my general answer is you always, when you get down to the nitty-gritty of it, have to look at the details of the particular situation, and I must say in this case my opinions about the coal industry have been changed very much by looking at the data in the record.

[2439] I started out thinking that coal was an industry of lots of small producers and that it was a dying industry. I have changed that view very substantially in the course of this. I don't know if that answers your question.

THE COURT: That answers the question. Are there any questions as a result of mine? Mr. Hedlund?

MR. HEDLUND: Yes, your Honor. Just one.

BY MR. HEDLUND:

Q Are there many industries with which you are familiar, Professor Steiner, where the type of buying in terms of long-term contracts is as prevalent as it is in the coal industry?

A Not many. I think when electric utilities, to take another situation, buy steam turbine generators, they are buying in effect long-term delivery of services. Heavy equipment, and this sort of thing is of course buying a stream of services over many years.

But I think any place where you have purchasing of very expensive either supplies in terms of this kind of long-term supply contract or in terms of equipment, which after all is providing services over a long period, has this kind of importance to buying. I think it is no coincidence in electric power that the [2440] same executives frequently—Philip Sporn, for example, who has testified, does the coal buying and also, I understand, does most of the heavy equipment buying, or he did when he was president of AEP.

THE COURT: Any questions, Mr. Cusack, as a result of mine?

MR. CUSACK: Perhaps one.

RECROSS EXAMINATION

BY MR. CUSACK:

Q Would you analogize the steel industry with the coal industry?

A In what dimensions, Mr. Cusack? Surely there are some similarities. There are some tremendous differences.

Q In regard to freight rates and freight costs.

A I think steel is a purchaser and requires large quantities of both coal and iron ore. It is therefore heavily influenced by that. It is different in that complicated steel products and steel products unfabricated carry a much heavier, higher, unit value than coal.

When you are talking about a ton of steel, you are talking about well over a hundred dollars a ton as the value of that shipment. You can support [2441] a good deal more freight rate with that than you are talking about when you talk about a commodity that bears a value of five or six or even in the case of metallurgical at ten or twelve dollars a ton.

So they are similar in some respects and different in others.

[2445]

IN THE UNITED STATES DISTRICT COURT
NORTHERN DISTRICT OF ILLINOIS
EASTERN DIVISION

No. 67 C 1632

UNITED STATES OF AMERICA, PLAINTIFF

vs.

GENERAL DYNAMICS CORPORATION; THE UNITED ELECTRIC COAL COMPANIES; and FREEMAN COAL MINING CORPORATION, DEFENDANTS.

Before the HON. EDWIN A. ROBSON, Chief Judge

Wednesday, April 22, 1970

12:20 o'clock a.m.

PRESENT:

MR. JOHN THOMAS CUSACK,
MR. ROBERT L. EISEN,
MR. RONALD L. FUTTERMAN, and
MR. RICHARD J. BRAUN,

appeared for Plaintiff;

MR. REUBEN L. HEDLUND,
MR. DONALD G. KEMPF, JR., and
MR. RICHARD H. IRVING, III,

appeared for Defendants.

ALSO PRESENT:

DR. PETER STEINER.

[2446] THE CLERK: Case on trial.

THE COURT: Good morning, counsel. Are both sides ready to proceed?

MR. CUSACK: Yes, your Honor.

MR. HEDLUND: Yes, your Honor. I have a preliminary matter.

At this time, your Honor, to the extent I have not done so before, we wish to offer into evidence Defendants' Exhibits 227 through 239, and I will not take the trouble of reading—I have a list that I propose to give to the Court Reporter, if that would be satisfactory.

THE COURT: Any objection?

MR. CUSACK: We have no objection to any of the exhibits except in DX-239. Mr. Futterman has some expertise on that. May we delay our comment on that until I have a chance to confer with him? He is the "239 man."

THE COURT: All right. All exhibits may be admitted into evidence except 239.

(Defendants' Exhibits 227 through 238, previously marked, were received in evidence, a description thereof incorporated in the record herein following, to-wit:)

UNITED STATES v. *GENERAL DYNAMICS, et al.*

67 C 1632

DEFENDANTS' EXHIBITS

(Continued)

DX NO.

227 November 1, 1963 Memorandum from R. H. Inman to R. J. Hepburn re Freeman analysis of Kerr Mine.

228 Excerpts from the Minutes of the Board of Directors of The United Electric Coal Companies for September, 1966, pages 4386-4389.

229 Form 250 Response to the Court-Ordered Subpoena Questionnaire for the Freeman Coal Mining Corporation.

230 April 13, 1970 letter from Mr. Allen Van Wyck, Chairman of the Board of Illinois Power Company to Donald G. Kempf, Jr.

231 April 14, 1970 letter from K. E. Bowen, President of Central Illinois Public Service Company, to Donald G. Kempf, Jr.

232 Brochure entitled "Low Cost Electric Power and Dependability . . . Through MAPP".

233 Brochure entitled "Mid-America Interpool Network —MAIN".

235 Article entitled "Shortage of Low-Sulphur Coal Hampers Electric Utilities in Antipollution Efforts," *The Wall Street Journal*, April 6, 1970.

236 April 1, 1970 letter from Marvin O. Young, Vice President and General Counsel for Peabody Coal Company, to Reuben L. Hedlund re coal reserves in McDonough, Schuyler, Adams, Brown and Hancock Counties (Illinois).

237 Series of four tables: (1) "Fraction of Total Illinois Production of Leading Companies Other Than Peabody"; (2) "Average Production Per Company"; (3) "Changes in Concentration in Illinois Coal Production Since 1959"; (4) "Changes in Concentration in Illinois, Indiana, and Western Kentucky Since 1959".

238 Telegram of March 5, 1970 from Stephen F. Dunn, President of the National Coal Association, to the President of the United States re foreign oil imports to Midwestern utilities.

• • • •

[2450] JAMES M. FOLSOM,

called as a witness in rebuttal by the plaintiff herein, having been first duly sworn, was examined and testified as follows:

DIRECT EXAMINATION

BY MR. CUSACK:

Q Please state your full name.

[2451] A James M. Folsom, F-o-l-s-o-m.

Q And what is your home address?

A 2704 Clagary Road, Kingston, Maryland.

Q And what is your position, sir?

A I am an economist of the Federal Trade Commission.

MR. CUSACK: I ask the Court Reporter to mark for identification as Government's Exhibit 140 the vitae on Mr. Folsom, a two-page document.

(The above document was thereupon marked as Government's Exhibit 140 for identification.)

MR. CUSACK: Your Honor, the Government moves the admission in evidence of GX-140.

MR. HEDLUND: We have no objection, your Honor.

THE COURT: It may be admitted.

BY MR. CUSACK:

Q Mr. Folsom, the vitae does not indicate what cases in which you have testified on in regard to your duties at the Federal Trade Commission as an economist. Could you please tell us which cases you have testified on?

BY THE WITNESS:

A Federal Trade Commission v. Sperry & [2452] Hutchinson Corporation.

Federal Trade Commission v. Kennecott Copper Corporation.

Federal Trade Commission v. Allied Chemical Corporation.

Federal Trade Commission v. Papercraft Corporation.

Q Thank you. In regard to this lawsuit, Mr. Folsom, have you been present during this trial?

A Except for one or two hours of one afternoon, I was present during the giving of the evidence.

Q And did you read the transcript of that portion of the trial in which you were not present?

A Yes, I did.

Q And did you read the depositions in this trial?

A Yes, I did.

Q And did you read the deposition exhibits?

A Yes.

Q And did you—

A Excuse me. I did not read completely all of the deposition exhibits; I skimmed the deposition exhibits.

Q Are you familiar with the Government and the defense statistical exhibits in this lawsuit?

[2453] A Yes, I am.

Q Professor Folsom—excuse me. Mr. Folsom, approximately when did you start work on this case?

A I believe it is about two months ago, when I first came to Chicago.

Q Can you give the Court an estimate of the amount of time that you have spent on this case?

A Approximately 300 hours.

Q Sir, based on your examination of the evidence in this caes have you come to any conclusion in regard to competition, if any, between United Electric and Freeman?

A Yes, I have.

[2454] Q And what are those conclusions, sir?

A I conclude that Freeman and UEC were competitors.

Q And can you tell us on what you base that opinion?

A Mr. Camacia, in his deposition, indicated that UEC and Freeman were competitors.

Mr. Nugent, in his deposition, indicated that they were competitors by laying out the areas.

And the statistical exhibits of the Government indicate sales to common facilities, as well as common customers.

Beyond that, one of the defendants' exhibits shows

that Freeman was selling steam coal to Inland Steel in substantial quantities, 90,000 plus tons in 1964, and that UEC was selling steam coal in excess of 30,000 tons to the same customer.

Q And that would be in addition to the information set forth on the common customer charts which is for 1965, 1966, and 1967; is that correct?

A Yes.

Q Based on the evidence in this case, sir, have you come to any conclusions in regard to whether or not coal is, from an economic sense, a separate market?

[2455] A Yes.

Q And what are those conclusions, sir?

A I conclude that coal can appropriately be treated as a sub-market or separate market within the energy field.

Q And on what do you base that opinion, sir?

A A number of things. One, if I may first look at the fossil fuel market—let me begin by saying that there is certainly an energy market. One of the defendants exhibits in this case indicates that there is considerable inter-fuel competition, but that inter-fuel competition is greatest in areas where there are no native fuel resources, such as in New England. There is a specific example that it gives.

Within the midwestern region there are native fuel resources, namely coal in substantial quantities.

Professor Steiner indicated that oil was not a factor in the midwestern markets, during his deposition.

I believe the Steam Electric Plant Factors bears him out in this respect. It shows fossil fuels consumed in Illinois, of which 93 percent was coal by electric generating facilities. In Indiana 97 percent was coal. In west Kentucky 100 percent—excuse me. In Kentucky—west Kentucky is not broken down—in [2456] Kentucky, 100 percent was coal.

One of the Government exhibits indicates that in the—what they call the Eastern Interior Sales Province, I believe 97 percent of the fossil fuels were coal.

This is all for the year 1967.

Further, the evidence in this case indicates that there

is a substantial price differential between coal and gas and fuel—excuse me—residual fuel oil in much of that area.

As you began to get to the fringes of the area, the differential decreases.

The evidence in this case, I believe, indicates that the competition of gas, which is essentially making up the other 7 percent in Illinois, the other 3 percent in Indiana, is of a seasonal nature.

I think, given the seasonal nature of the gas competition that it is appropriate not to include it in a complete analysis of the coal competition.

Witnesses have indicated that the primary competition is the head-to-head competition between coal companies.

If I may address myself to the nuclear question, with the exception of Commonwealth Edison, and of [2457] companies in Minnesota, the far out portions of the Eastern Interior Sales Province, the companies indicated that nuclear was more expensive than was coal.

Further, the evidence in this case indicates that coal—excuse me—that nuclear is not competitive with coal. If the size of the generating unit is 500 megawatts or less, it is not competitive. There is one example of a plant of smaller than that capacity, a 60 megawatt plant which was to have come on line in 1965, but which, according to the deposition testimony is—I believe that is Mr. Abrahamson—is still not on line at the time of his deposition.

[2458] Q Do you recall any comment that Mr. Abrahamson made in regard to his utility's experience with regard to nuclear?

A He was unhappy; I believe, to be exact, he said that they had had a belly-full of the nuclear experience. That is, I think, understandable, given the size of the unit and the delay involved.

Another reason, and my final reason, for considering the coal as a separate line of commerce is that if we look at existing plants, it does not seem feasible from the evidence in this record to convert an existing plant to nuclear. There are some plants which might be converted to other fuels, but nuclear is certainly out in terms of a conversion.

Q Are there any indications to you, other than economic factors, that you have indicated in regard to looking at coal as a separate market? For example, Professor Steiner testified that—

MR. HEDLUND: Your Honor, I am going to object. I think this is getting into an unnecessary leading question.

THE COURT: He has not completed the question. Complete your question.

BY MR. CUSACK:

[2459] Q Professor Steiner indicated that the coal producers had trade associations and had certain publications, and so forth. Is this of any significant factor to you in the recognition of coal as a separate economic product?

A There are a number of organizations which deal with coal as an industry. I do not consider these as important as the price differential from an economic point about which I spoke. As Professor Steiner indicated, either in his deposition or in his testimony before this Court, one of the reasons for segregating a particular commodity and calling that commodity a market by itself would be based on a price differential, and I did see that price differential within the market.

[2460] Q In regard to the feasibility of the cost of nuclear energy, is there anything in the record in that regard from which you could make an estimate of the future extent of the nuclear commitment by the public utilities?

A I don't believe that I can make a good estimate of the future extent of the commitment of public utilities to nuclear beyond what is shown in the record, where you have projections of nuclear orders through 1975 or 1976.

I would say in that regard that this record is fairly clear that any nuclear plant which is going to be in operation before 1976 must have been ordered by this time.

Q Mr. Folsom, Mr. Corey of Commonwealth Edison testified that four of the Commonwealth Edison nuclear

stations were turn-key plants. Does this have any effect, do you think, on the nuclear commitment in particular of Commonwealth Edison, and may it change in the future?

A I don't believe that is in Mr. Corey's testimony. I believe that is in one of the defense exhibits, where they talk about the six—excuse me: seven—nuclear plants. Dresden No. 1, which Mr. Corey referred to in his testimony as a "Model T plant" and then there were four additional nuclear plants. One of the defendants' [2461] exhibits shows that those were ordered at a capital cost of approximately $118 per kilowatt.

Mr. Corey indicated in his testimony that the current capital costs of nuclear are running about $300 per kilowatt.

At the time that those four turn key plants were ordered, the cost of a coal plant was estimated at about $120 per kilowatt. Today, Mr. Corey testified, the cost of a coal plant is in the neighborhood of $220 per kilowatt.

Q When, in your opinion, from an economic standpoint, was there a merger of Freeman and United Electric? Do you have any views on that?

A The question of when there is a merger is, I believe, a legal one. I have an opinion on control and when that occurred. But when the merger occurred, I believe that is a legal question.

[2462] Q When in your opinion, from an economic standpoint, was control achieved over United Electric by the defendants?

A In late 1959.

Q Based on your examination of the record, what in your opinion were the anti-competitive effects, if any, of the control of United Electric by General Dynamics and Freeman.

A One is the structural effect. Both of these firms, the record shows, had been substantial competitors within the coal industry. The record gives a reason for believing that UEC would have continued as a substantial competitor within the coal industry. It might not have done as much strip mining in the future. The record gives some reason for believing that UEC would have gone into underground mining.

There are three things I note prior to 1959 in this respect. One is Mr. Kolbe, in letters written in response to people who inquired as to the interest of UEC in underground reserves—in his first two letters prior to 1966, he stated—

Q Excuse me. That is 1956, isn't it?

* * * *

[2463] Q Is there any other testimony that you recall in the record in regard to the possibility of United Electric going underground if it were not affiliated [2464] with Freeman?

MR. HEDLUND: Your Honor, I did not hear the last part of that question.

THE COURT: Read the last part of that question.

(Record read by the Reporter.)

BY THE WITNESS:

A I recall Mr. Dorrance, I believe is the proper name, in his deposition indicating that Mr. Utterback had told him that UEC was going underground. I do not recall the date of this, hence I hesitate to say this occurred prior to 1959.

Q Mr. Folsom, the defendants contend that the Greater Chicago Air Quality Control Region, which the evidence shows receives coal from Fulton-Peoria, Springfield, Belleville, Southern Illinois, West Kentucky, and Indiana—they contend that the Greater Chicago Air Quality Control Region is, from an economic standpoint, a separate market.

In your view do you believe this is correct?

A No, I do not believe that is correct.

[2465] Q What is the reason for that, sir?

A One, other areas than Chicago are going to have air pollution controls, according to the information in this record. Separating out one market on the basis of air pollution controls does not seem to me to be appropriate.

Q The defendants also contend, Mr. Folsom, that Commonwealth Edison Company at its plants, wherever located, and the record shows that it has major coal-fired

stations at Kincaid, south of Springfield, near Pekin, Dixon, Rockford, Waukegan, State Line, Chicago, and in Will County—that Commonwealth Edison Company is a separate geographic market. Do you have any comments on that?

A Yes. Three reasons are given by the defendants for treating Commonwealth Edison as a separate market. One, the size of Commonwealth Edison; two, the fact that Commonwealth Edison will be affected by air pollution control; and, three, Commonwealth Edison's commitment to nuclear.

I do not believe that it is appropriate from an economic standpoint to separate out a customer on the basis of its size. An analogy: it makes sense in talking, economic sense in talking, about the automotive parts [2466] industry, to talk about the original equipment industry and the replacement equipment industry. To treat General Motors as a separate customer, I do not believe makes economic sense.

Q You mean as a separate customer being a separate market?

A A separate market. It does not make economic sense. Two, in terms of the commitment to nuclear, virtually every utility official who testified either through deposition or from the stand, during the hearings on this matter indicated that they have considered all fuels in making a decision as to which one was the most appropriate. I think they would be derelict in their duty if they did not and that the public service commissions might well call them to task. All except Commonwealth Edison within the Indiana-Illinois area, I believe, indicated they found it much too costly.

Thirdly, in reference to air pollution control, virtually every utility official indicated their concern with air pollution.

Now, if we go to the location of specific plants, many of Commonwealth Edison's plants are located outside of the city limits of Chicago. The newspaper clippings, et cetera, which were put in by the defendants [2467] indicate that Commonwealth Edison's greatest concern is within the city limits of Chicago.

Q As you will recall, Mr. Folsom, the defendants have attempted to set up various geographic markets. They have a geographic market after excluding Commonwealth Edison Company and shipments to the Chicago Air Quality Control Region; they have a geographic market for the Springfield area, for the Belleville area, for the southern Illinois freight rate district, and for the Fulton-Peoria freight rate district.

Based on that, do you have any opinion on whether or not these geographic markets which they have argued for make economic sense?

A Yes, I have an opinion.

[2468] Q And what is that, sir?

A Since I reject the separation of the Chicago Air Control Area and of Commonwealth Edison, these markets do not make any economic sense unless one does completely separate out those areas.

The testimony in this case, as well as the statistical evidence, indicates that a very large quantity of coal, relatively, moves out of each of these districts to other areas primarily to Commonwealth Edison sometimes within the area, or to the Chicago Air Control Region.

Mr. Camicia testified that the majority—usually the majority of the coal is sold outside of the freight rate district in which the mine is located.

Q The Government contends that one of the relevant geographic markets in this lawsuit is what is referred to as the Eastern Interior Coal Province, which is mining districts 9, 10 and 11, what we consider to be a producing area. This is made up of the coal mines located in Illinois, Indiana, and west Kentucky.

Is there any evidence in the record which would indicate to you that the Eastern Interior Coal Province is a proper economic—is a separate economic producing area?

A A separate economic producing area. There [2469] is physical information which indicates that it is a separate producing area. The location of the coal field, and the separation between the coal field in this area and other coal fields indicates that.

There is evidence in the record that this is geologically a coal field.

Q The Government also contends that one of the geographic markets, relevant geographic markets in this case is an area designated as the Eastern Interior Coal Province Sales Area.

What are your views in regard to the validity of the Eastern Interior Coal Province Sales Area as being a proper economic market?

A I did not participate in the drawing up of any of the markets alleged by either the Government or the defendants in this case.

My job was to analyze the markets as contended by the defendants, and by the Government, and from that to decide which was the most appropriate market.

On that basis, I concluded that the State of Illinois was the most appropriate market.

The Eastern Interial Coal Province does seem to be an appropriate market. I, however, have some problems with the Eastern Interior Coal Province, namely, [2470] that coal is expensive to transport.

However, the evidence in this case shows that coal was transported for quite long distances. Mr. Abrahamson of the power company in Wisconsin, I believe, indicated that they have bought coal all over the midwest during the recent shortage.

Mr. Tarzy, who was once in the sales operation of UEC supported the midwest area as a market concept.

Q Would the fact that a high percentage of the coal consumed in the Eastern Interior Coal Province Sales Area was produced in the Eastern Interior Coal Province, that is, Illinois, Indiana and west Kentucky, have a bearing on whether the Eastern Interior Coal Province Sales Area is a proper geographic market?

A It would have a bearing, but it would not be a controlling factor.

The record shows more than 80 percent of the coal produced in the area is consumed in the area, and more than 80 percent of the consumption within the area comes from producers within the area.

Q In regard to the State of Indiana, sir, is there evidence that coal produced in Indiana is sold in Illinois, and coal produced in Illinois is sold in Indiana?

[2471] A I recall evidence that coal produced in Illinois is sold in Indiana.

I draw a blank as to whether there is evidence on coal being sold from Indiana into Illinois.

Q Assume, sir, that the Illinois coal producers collusively or otherwise raised their prices, while the Indiana producers' prices remained at a pre-collusive raising level.

Where then would the consumers of Illinois coal be most likely to turn, under those circumstances?

A If the price were raised enough to make it above the cost of transportation, there is a possibility of them turning to Indiana or west Kentucky.

There are problems in turning to Indiana in that, if there is collusion in Illinois, since you have the same mines operating in Indiana, the same companies, you are not likely to get a competitive price in Indiana.

To some extent, the same is true of west Kentucky, although there are companies, I believe, which operate in west Kentucky which do not operate in either Illinois or Indiana.

[2472] Q Does the record indicate, sir, that there are any trade associations limited to the producers located in Illinois, Indiana, and west Kentucky?

A The record indicates there is at least one trade association, the Midwest Coal Producers Institute, I believe.

Q And is that limited to producers operating in Illinois, Indiana and west Kentucky?

A I believe that is limited to producers in mining districts 9, 10, and 11, of which would be Illinois, Indiana and west Kentucky.

Q Mr. Folsom, the defendants contend that a number of shipments by Freeman and United Electric to the same customers, as well as to the same identical facility of a number of customers, are not in competition because Freeman shipped to these destinations and/or customers what is called "coal dust."

Do you have any comment on the economic validity of that argument?

A Yes.

Q And what is that, sir?

A I believe that the coal dust is certainly competitive with coal.

The record shows that these facilities [2473] buying coal dust cannot consume coal dust alone, but the record certainly indicates that each time they buy a ton of coal dust, in terms of equivalent BTU's, they are not buying a ton of coal sizes, screenings, if you will.

Now the proportion, or the displacement possible varies according to the utilities who testified here. Union Electric testified that they could take up to 60 percent dust, rather than screenings at one of their plants. One other facility indicated they could only take up to 10 percent dust. One other company—excuse me, not facility.

Q Is it of any significance to you in regard to this dust-screening coal argument in regard to the pulverization of coal as it is used in a number of the electrical generating plants?

A Well, the testimony indicated that the dust could not be used unless there was a coal pulverizer attached to the plant.

In that sense, unless the coal is being pulverized, the company could not buy dust as a substitute for screenings. But they are substitutes to the extent that the company buys dust, and hence are in competition to the extent that they can use dust.

[2474] Q Do you find it anomalous that the defendants argument that so far as the fuel requirements of a number of generating stations, oil, natural gas, and coal are competitive fuels, while they appear to contend that coal dust and other coal sizes are not competitive fuels?

MR. HEDLUND: I will object as to whether or not this witness thinks it is anomalous.

I think that question can be asked without going into that.

THE COURT: Do you have any comment?

MR. CUSACK: I will rephrase it, if you want me to.

THE COURT: Revise the question.

BY MR. CUSACK:

Q Mr. Folsom, the defendants contend that for the energy fuel requirements of a number of electrical gen-

erating stations coal, natural gas, and oil are in competition.

Do you find that argument, from an economic standpoint, inconsistent with their argument that coal dust and other coal sizes are then not in competition?

A Yes. I consider this, from an economic standpoint, trying to go in both directions, one to [2475] expand the market, and the other to restrict the market.

Q Based on the record in this lawsuit, sir, and based on your economic opinion, do you have any views in regard to what United Electric might have done but for its control by Freeman?

A Yes.

Q And what are these views, sir?

A Absent a merger, I see three alternatives facing the United Electric Coal Company.

One, they—

MR. HEDLUND: May I hear—well, your Honor, I'm sorry.

[2476] THE COURT: Proceed, Mr. Folsom.

BY THE WITNESS:

A One, they could mine themselves out of business. I do not believe this is an attractive alternative to the company, based on the testimony of Mr. Kolbe and others. It does not seem to be the type of approach that a company with UEC's assets would take, giving that the customers are very valuable, or are a valuable asset.

Two, that UEC would make an intensive search for strip reserves.

I do believe that this record indicates that high quality strip reserves are relatively scarce in Illinois.

Mr. Kolbe, in his deposition, indicated that they might well turn to strip—might well have turned to strip reserves of a less desirable nature in their search for strip reserves.

Three, there is the possibility that the company would have gone into deep mining. We had the beginning of this approach prior to 1959.

* * * *

[2483] BY MR. CUSACK:

Q Mr. Folsom, Dr. Steiner indicates that the three indicia of competition are structure, conduct and per-

formance. Of those three indicia of competition what would you consider to be the most important?

A I consider structure the most important of those three indicia of competition.

MR. CUSACK: Your Honor, may I make a comment in regard to the question with regard to the concentration nationally and the concentration in the area? There is evidence in the record in this regard.

THE COURT: There is. I have not read it.

MR. CUSACK: It is the Netschert documents versus ours.

THE COURT: All right.

BY MR. CUSACK:

Q Why do you consider structure to be the most important indicia of competition?

A Because for short periods of time you might have collusive behavior, that is, bad conduct, even in an unconcentrated industry. Or you might have good [2484] performance within a highly concentrated industry. But if you have a concentrated industry, you have the potential of bad performance.

An example: the rubber tire industry was studied by Mr. Wilcox during the Temporary National Economic Committee's studies, and he stated that this was a highly concentrated industry which he found at that time to have good performance, because of an individual who acted as a maverick, Harvey Firestone. But Harvey Firestone and others die and you do have the potential of bad performance from the structure, and we have to be concerned about these potentials.

[2485] Q Going back to competition between Freeman and United Electric, there is a good deal of testimony in the evidence that the shipments from the Fidelity Mine in the Belleville District to the Shawnee Plant of the Tennessee Valley Authority were not in competition with the shipments from one of the Orient Mines of Freeman to this plant.

Based on the evidence in the record, what is your opinion as to whether or not the coal shipments from these two mines to this plant of TVA were in competition?

A The evidence in the record indicates that the two companies were under common control at the time of the shipments, and that it was shipped under a Freeman contract.

You might have a different situation if the two companies were not under common control.

The way the thing occurred in the record, I would not say that that particular shipment represented competition. It does show, however, that a coal company will often absorb freight, if you will, or take a lower price, whichever way you wish to look at it, in order to move into a more distant market or to a more distant customer, which is a better description, in order to [2486] keep his mine operating at something near capacity.

* * * *

[2493] CROSS EXAMINATION

* * * *

BY MR. HEDLUND:

Q It also, does it not, provides a framework for potential competition among and between all three of those fuels.

A It does provide a framework for potential competition.

Q You are familiar with the two statements I just read you, are you not?

A No, I am not.

Q Would it refresh your recollection if I were to indicate to you that those two statements I just read you were from the Economic Report on Corporate Mergers of the Federal Trade Commission?

A Not really. That is a very thick report, as you know, Mr. Hedlund. There are so many statements in there, some of which I reviewed, some of which I did not, that I cannot remember every statement that is in there.

Q I understand, Mr. Folsom. You did indicate to me, Mr. Folsom, when we were provided this volume a couple of days ago, that you, in terms of, as it is referred to in the preface, a major contribution to this re-

port, were involved in the matters set forth in Chapter 5 and Chapter 8. You recall that, do you not?

A Yes, I do.

[2494] Q Then, directing your attention to Chapter 5 of that report on page 310, I would like to read to you the following:

> "The impact of these mergers (referring to mergers involving coal companies and oil companies) on competition may be considered from a number of viewpoints. There is a high elasticity of substitution among coal, fuel oil and natural gas as raw materials from which energy is produced. This is particularly marked in the case of electric utilities which have constructed generating stations so they can ultimately consume any of the three principal fuels.
>
> "Before expanding into coal, the petroleum industry occupied a dominant position as a supplier of natural gas as well as fuel oil. The merger trend that Continental-Consolidation set in motion could over time extend that dominance to coal."

Do you recall that appearing in Chapter 5 of the report by the FTC entitled "Economic Report on Corporate Mergers"?

A It sounds familiar.

* * * *

[2499] Q In other words, before you try to define the region in terms of the geographical sense, you try to determine where the competition takes place, or what the competition is, and then you decide or determine what geographical area that takes place in; is that not correct?

A Well, the first statement was as a theoretical statement.

Q Yes.

A Now, you are getting down to a practical application.

As a matter of practical application, you often wind up using areas in asking your questions simply because that is the way the data is often kept by the companies. But from a theoretical standpoint, the geographic area does not determine the market.

Q Thank you.

A The market is determined, then the geographic area.

Q Isn't it true, Mr. Folsom, that state boundaries are generally of little or no significance in determining relevant market?

And I'm talking economically.

[2500] A With exceptions.

In general, political boundaries of any type, state or otherwise, are not a good determinant of a market.

As I indicated earlier, the market is determined, then the boundary.

As a matter of practicality, you often wind up using a political boundary as your best approximation of the market.

Q Are you familiar with any laws of the State of Illinois that have any effect on a determination of a meaningful and relevant market for coal?

A No, I am not. I must admit I am not familiar with the laws of the State of Illinois at all.

There may be mine safety laws and things of this type; I just don't know.

[2501] Q Well, passing the laws that you say you don't know about, is there any other factor that you can name in Illinois that makes the political boundaries of the State a meaningful measure of the relevant geographic market for coal?

A No.

Q Then it would be your view, would it not, Mr. Folsom, that the opinion of the Hearing Examiner in the Kennecott case was correct when he stated, commenting on your testimony in that case—

MR. CUSACK: On what page is that, please?

MR. HEDLUND: It is page 193.

MR. CUSACK: I wish counsel would—

MR. HEDLUND: Page 172 of the original transcript.

MR. CUSACK: I would like to point out for the record that I would appreciate it, Mr. Hedlund, if you would let us know what documents you are going to use with Mr. Folsom on cross examination; then I could go a little faster.

MR. HEDLUND: I'm sorry.
May I have the beginning of my question?
THE COURT: Yes, read it.
MR. CUSACK: May I read along?
THE COURT: Is there any objection?

• • • •

[2505] Q And you testified you had spent about 300 hours [2506] so far in this case, prior to—or did that include the trial time?

A That included the trial time.

Q You came to Chicago a month before the trial started; is that correct?

A Approximately. I don't remember—wait a minute. I believe it was more than two months before the trial started, because there was a delay. I had thought I would be coming up about a month earlier, or two weeks earlier, or something, than I did. I don't remember the specific date.

Q Do you recall in Kennecott, do you not, that counsel for the Federal Trade Commission stated that you were not an expert in coal usage? You recall that, do you not?

A I don't recall it. If you say he stated it, I have no reason to question it.

[2507] Q He did so state it at pages 782 of the transcript, Mr. Kadish saying:

> "Again I state that Mr. Folsom is not an expert in coal usage."

Was that true at the time?

A Yes.

Q Prior to that case, do you recall, page 772 of the transcript, being asked this question:

> "Q How many weeks did you spend reading up on coal?
>
> "A Weeks.
>
> "Q Or days?
>
> "A Approximately three months."

Do you recall being asked that and giving those answers?

A That in general accords with my recollection. Remember, this was a year ago, and I don't recall the specific

answers. That time would have been fresh in my mind at that time.

Q I understand.

* * * *

[2516] Q You would also agree that a man should study the market for a very long period of time before trying [2517] to say that this is the market. Would you agree with that, too?

A Define "a long period of time." In general a man should make an intensive study if he is going to define the market.

Q Numbers alone do not define the market, do they?

A No, they do not.

Q And you have to know the buy-sell relationship, and you have to consider a number of other factors other than just numbers in defining a market, don't you?

A Yes, you do.

* * * *

[2519] Q It is your understanding, is it not, Mr. Folsom, that metallurgical coal and steam coal are not competitive, at least for metallurgical coal uses, is that correct?

A Yes.

Q Of course, the Government statistics, none of them, separate that, do they?

A In the midwest area I did not see any Government statistics separating metallurgical coal.

Q So that in effect these statistics, if there is no separation, and if the statistics include both steam and metallurgical coal, they are combining within those statistics two entirely different and non-competitive products, isn't that correct?

A No. I don't believe that is correct. In this area, if I may comment, the Orient No. 3 Mine, for example, sells metallurgical or coal for metallurgical purposes. It also sells some coal for steam purposes. So it seems that within that particular mine—and I don't know whether that is typical of mines in the midwest—the coal which could be for use for metallurgical purposes also can be used for steam purposes. One of your exhibits also states this.

[2520] I don't know what the price differential is, et cetera. It is obvious that there is some coal that can be used for steam purposes that cannot be used for metallurgical purposes. It is not obvious the other way around.

Q What about with respect to United Electric? You know if it has any coal that can be used for metallurgical purposes?

A From what I saw of the data on coal characteristics at UEC, it does not have any coal that could be used for metallurgical purposes that it is currently mining. I did not see data on coal analysis of any possible reserves they might have.

[2521] Q With respect to coal produced in the State of Illinois, do you have any knowledge of what percent of that coal is sold for metallurgical purposes?

A No, I don't have a knowledge of the percent sold for metallurgical purposes.

Q What about the State of Indiana?

A No.

Q What about west Kentucky?

A No.

Q But it would be your conclusion, would it not, that metallurgical coal and steam coal are not part of the same relevant market?

A It would be my conclusion that metallurgical coal cannot be substituted for by steam coal. If, in fact, a substantial quantity of that which could be used for metallurgical purposes is being sold as steam coal, then it seems to me appropriate to combine the two in looking at the market.

Q The market for what?

A For coal.

Q For all coal, or for steam coal?

A For all coal.

Q If you were to look at the market for metallurgical coal, would you include steam coal in that?

[2522] A The market for metallurgical would be, I think, a sub-market, and you would not consider—it becomes so inter-related, I'm not certain that you wouldn't have to consider the steam market there, because the

utility, if this metallurgical coal is selling for about the same price on a BTU basis as the steam coal, the utility is competitive, in a shortage, even with the—in its purchase, even with the companies who are buying coal for metallurgical purposes.

Q Do you know what, if any, price differential there is between steam coal and metallurgical coal?

A No, I don't.

Q Do you recall being asked the question, and giving the following answer in the Kennecott case, at page 760, where you were asked as follows:

"Q Would it follow that they are not"—

MR. CUSACK: Just a moment, please.

MR. HEDLUND: I'm sorry. I will start again. Page 759 of your testimony.

* * * *

[2536] AFTERNOON SESSION

2:00 p.m.

* * * *

Q Well, then—all right, let me ask you, do you believe that the Eastern Interior Coal Province Sales Area constitutes a reasonable determination of an economic market?

A Looking at the various markets, I was not as happy with the Eastern Interior Coal Province, in spite of the high percentages, as I was—not as satisfied with the definition as I was with the State of Illinois. I think I indicated to you some of the problems I had with the Eastern Interior Sales Area, namely, the State of Indiana being a big problem.

[2537] Q I understand that. But my question is, do you think the Eastern Interior Coal Province Sales Area represents a reasonably good approximation of an economic market?

A Yes, I think it is a reasonable approximation, with some reservations.

Q You stated this morning, Mr. Folsom, I believe, that in defining markets you always have imprecisions?

A Yes.

Q I believe on Monday Professor Steiner also said that market definitions is not a council of perfection

and that his criticism of the Government's markets was not that they were less than fully perfect, but that they were less good than they should be.

Now, isn't it true, Mr. Folsom, as far as economists are concerned, that given two conflicting market definitions, both with approximations, that the task then for the economist is to determine which of the two makes the most economic sense?

A Yes.

Q You would agree with that?

A Yes.

Q Are you familiar with the concept of a unified market?

A Roughly.

* * * *

[2556] Q You have referred to the competition in the east between all of the various forms of energy, because that is not a native fuel area. Wasn't that the concept or is that the phrase you used?

A Yes, that is the phrase which is in the exhibit DX-102.

Q And I believe you testified that the midwest, or, let's say, Illinois is a native fuel area; is that correct?

A Yes.

Q And it was your testimony that, based on costs in Illinois, that nuclear energy does not compete with coal; is that the thrust of your testimony?

A I think my testimony was that the utility people had indicated a substantial cost differential between nuclear and coal, particularly those located in the State of Illinois, with the exception of Commonwealth Edison, and that based on that price differential, and the fact that you could not use nuclear for less than a 500 megawatt efficiency, that I would separate them.

But at the same time I indicated that I did recognize that there was such a thing as an energy market.

* * * *

[2563] Q I believe, Mr. Folsom, you stated that the evidence in this record from customers indicated that as far as they were concerned, the primary competition for their business was that provided by coal suppliers?

A If the record shows that, I misspoke; or else the record is incorrect.

I believe that what I saw in the record when the coal people were asked about their primary competition [2564] they mentioned first other coal companies, and that some of the exhibits, the publications which you have put into the record, speak of head-to-head competition and the most immediate competition being the head-to-head competition between fuel companies within the same line of operation, or with the same product.

Q This is what the coal producers said?

A The coal producers, and some of the publications.

Q Yes. What do the customers in this case say?

A The customers in this case all—all the utility customers have indicated that they consider all sources of fuel in making the decision.

Q There was nothing then that they considered their—the primary competition for their business was coal?

A They did not say that they considered the primary competition coal with reference to future facilities, certainly.

[2565] Q In fact, many of them said just the opposite, didn't they?

A They also said they would consider all things, and then make a decision. Many of them stated about price and what they assumed their facilities would be.

Q I would like to ask your opinion on what Mr. Corey said at page 1612 and 1613. I'm not going to read the entire answer. If Mr. Cusack wants to, he can get it on redirect.

I asked Mr. Corey the following:

> "In your opinion, Mr. Corey, what is Commonwealth Edison's major concern with respect to competition among its fuel or energy suppliers?"
>
> "A I guess it is to have adequate competition. And as the energy field gets more diverse, it is hopefully to continue to have effective competition between coal and oil, and nuclear. I believe that is one way of putting it."

Then he said:

> "I really would hate very much to see that we had to turn to coal, oil, and uranium to just two or three major oil companies. We might then find that we did have a very distinct lack of competition."

[2566] MR. CUSACK: The word is "for coal," not "to coal."

BY THE WITNESS:

A I recall the context in which he said that, yes. And I would agree with him, that I would hate to see only two or three companies selling oil, nuclear, and coal, that it would be of big concern, and not only from the standpoint of competition, but from the standpoint of the individual customers.

* * * *

[2572] BY MR. HEDLUND:

Q I gather, Mr. Folsom, it is your position as an economist, that from an economic standpoint, this merger took place in 1959?

A From an economic standpoint, I think control occurred in 1959.

Q And would you equate as an economist control with merger, or wouldn't you? I don't want to be playing games. I just want to find out where you come out on it.

A I do have a problem in equating that with a merger, and that problem is the minutes from General Dynamics in the early 1960's, where they were in the tight cash situation and were considering selling. So, mergers are not that easily revocable in general. That almost sounded at that time like General Dynamics looked at this as an investment, not complete control of the company.

Q You are basing that on the minutes?

A Yes.

Q You are disregarding the testimony of Mr. Nugent?

MR. CUSACK: I think that is an unfair characterization of Mr. Nugent's testimony, and on that basis I object.

MR. HEDLUND: I am asking.

THE COURT: He may answer. Objection is overruled.

BY THE WITNESS:

A My understanding is Mr. Nugent testified that [2573] it was his intention throughout that they merge. I may be wrong. If I am, I would be happy to be corrected.

Q In any event, I gather, Mr. Folsom, in terms of the structure aspect of this merger, you feel the structure within the industry as a result of this merger changed in 1959, not 1967?

A Yes, I do.

Q That, as you say, is the prime element of determination of the anti-competitive effect of the merger?

A The change in structure is a prime indicator. If there was not a change in structure, if you don't consider it as a change in structure in 1959, then I think what you wind up with is having a situation where from 1955 to 1966 you had almost a collusive action between two coal companies, because you had essentially the same board of management directing two coal companies, and I prefer to think that was not a collusion after 1959, that it was a more legitimate form of control.

* * * *

[2578] Q Even a year after Mr. Kolbe is saying "underground mining is not our business," isn't that correct?

A Oh, yes. That is correct.

Q Is it your view of the record that Mr. Kolbe acquired these reserves for Amalgamated because he wanted to go into the deep mining business?

A You are talking about the reserves required specifically for Amalgamated?

Q Correct.

A I don't think there is sufficient information to indicate one way or the other whether he planned to go into the underground mining business, because he was buying those reserves for Amalgamated.

Q Do you recall Mr. Kolbe testifying as follows, at page 189 of his testimony:

"The Beaucoup field. We said we did not care to tie up money that would not be—for coal fields that might never be mined and certainly would not be mined for a long time in the future. But they said they would. Their position, of course, was different."

Do you recall that testimony of Mr. Kolbe?

A Very generally. There are 900 plus pages of Mr. Kolbe's deposition, Mr. Hedlund. I read each and [2579] every one of them, but that doesn't—would you read that again so I will have it in mind if you wish to ask a question about it?

* * * *

[2581] Q Because if it had occurred after 1959, it is natural that it might occur because of the presence of Freeman, isn't that correct?

A There I have my interpretation of the record, namely that there was control and that it was being operated essentially as one company. Mr. Thorson disagreed with my characterization of the testimony. He was the director of UEC who did not feel it was being operated in that manner.

Q I gather, Mr. Folsom, that with regard to the disappearance of all these companies between 1957 and 1967, referred to as "other companies," the remaining companies in Government Exhibits—I assume that you agree that mergers by no means explain even a substantial portion of those disappearances.

A Yes, I do. You are talking about the smaller companies when you say "other companies."

Q Yes. With respect to Professor Steiner's testimony on that score, the two of you are in agreement, is that right?

A I think so.

* * * *

[2582] Q Let me rephrase the question: If we assume that United Electric would not have acquired additional economically mineable strip reserves, or had not been able to acquire additional economically mineable strip reserves between 1959 and 1967, if they had been inde-

pendent and if we assume that if they had been independent they would not have gone into deep mining, I gather your testimony is that except for this change in structure in market shares, this common ownership did not have an adverse effect on competition?

[2583] A The change in structure which reflects the loss of competition between the two companies during that period and beyond, yes. Nothing beyond that.

Q With my two assumptions?

A With your two assumptions, of course.

Q Of course, you don't agree with those two assumptions, is that correct?

A No, I don't.

Q So you don't agree with the testimony that indicates that they could not during that period, would not have, even absent Freeman, that they would not have gone into deep mining, absent Freeman?

A No, I don't.

Q You do not agree with the testimony of Mr. Camicia?

A Did Mr. Camicia testify that absent Freeman they wouldn't have done either of those? I don't recall you asking him, nor do I recall the Government asking him that question. If he so testified, then I would state that I don't agree.

Q As far as Illinois is concerned, or the EICP Sales Area, assuming the Government's definition for the moment, I gather it would be your testimony that if United Electric could not in the future acquire additional [2584] economically mineable strip reserves to serve those markets and either could not or would not undertake deep mining successfully, that the common ownership of these two companies would have no future adverse effects on competition in those markets. Is that your testimony?

A I haven't been asked that question, but I will say that if you start from today and if you make those two assumptions, assuming that they don't open any more mines, most of the coal in their current mines are committed, et cetera, that UEC is not going to be in that situation a viable competitive force in this market, even if it is divested from General Dynamics.

Does that answer it?

MR. HEDLUND: Your Honor, might this be a good time to take a short recess?

THE COURT: A five-minute recess.

(There was a short recess, after which the following further proceedings were had herein, to-wit:)

* * * *

[2589] Q I would like to ask you another question based on these assumptions.

Assume that two other coal producers, two coal producers other than UEC and Freeman, who are within this leading company list for 1967 proposed to merge and assume that UEC and Freeman are independent, unaffiliated companies.

Now, assume that one of these companies—one of these companies that proposes to merge has an annual production of approximately 6 million tons and the other approximately 4 million tons.

I would like you to assume further that the combined company, thus, with approximately 10 million tons of coal production would range behind Peabody as the second largest producer in the Illinois and the Eastern Interior Coal Province, with more than 13.5 percent of Illinois production, and 7.5 percent of the EIPC.

I will also ask you to assume that this combined company had coal reserves exceeding those of the combined UEC and Freeman operations by approximately 70 million tons.

And, finally, I want you to assume that the combined company would operate 8 coal mines located in [2590] Fulton-Peoria, Mineral-Atkinson, Murdock, Belleville, southern Illinois, and the west Kentucky freight rate district.

On the basis of those assumptions, Mr. Folsom, I would assume that you would agree, or that you would believe that the merger of the two companies in question would lead to the structural changes which you have referred to as essentially similar to those of UEC and Freeman combination, and would pose a similar threat to competition.

A I would be bothered by that acquisition, and would want to investigate that particular merger, if I were in a position to make the policy decision. I would want to investigate a merger between any of the top nine companies in the Illinois—State of Illinois at this particular time. We had 17 of those companies in 1957; we are down to about 9,000, about 300,000 tons annually. We are beginning to get too small in number to depend upon a structure to give good competitive performance, given the differential in size, and the presence of the Peabody, and a 13.5 percent combined second company.

Q So I gather then that just on the facts that I have given you, you would not conclude that that proposed merger posed a threat to competition?

[2591] A I would conclude that it proposed sufficient threat to look at it.

Q And you would—

A I don't recall—

Q You would have to look further, would you not?

A I think that would be true of any acquisition, Mr. Hedlund. I would not jump at one fact, and say, on the basis of one fact, "I'm going to draw a conclusion about competition."

Q Even if that one fact was simply market share?

A If—will you add that both companies were viable competitors?

Q Yes, in the same market.

A If they both were viable competitors and if we talk about the same market and the same level of concentration, top four approximately 75 percent today, I think that I will change and say, "Yes, I would, on that one fact alone, that would be almost presumptive evidence of an anti-competitive merger."

I would still want more information. I would still want to look further.

• • • •

[2595] Q Do you recall the deposition of Mr. Nicosin of Indianapolis—Indianapolis Service?

A I recall having read Mr. Nicosin deposition, yes.

Q Do you recall that he was asked this question and gave this answer:

"Does the presence of coal deposits and mines in Illinois and Kentucky serve as a restraint on the prices that Indiana coal producers can charge you?"

That was by Government counsel.

And there was an objection by me, saying that I did not understand the question.

But the question was repeated:

"Do you understand it?"

"A I am not sure that I do. Again I think the answer would be 'no,' in that transportation is such a big chunk of it, I don't see how a mine"—

There was an interruption here.

[2596] "—I don't see how mines way over on the other side of Illinois puts any restraint on Indiana."

Do you recall that?

A I think that is in accordance with my testimony though.

He mentioned transportation, and as I said this morning in terms of the price differential that if it was as great, or greater than transportation.

* * * *

BY MR. HEDLUND:

Q Yesterday, Mr. Cusack asked Professor Steiner if he knew of examples in analyzing markets where the facts with respect to a single company had in the past been viewed apart from other companies in order to secure a more meaningful and realistic economic appraisal.

I believe you may have testified this [2597] morning that you could think of no place where that sort of thing was done.

BY THE WITNESS:

A I can think of one place where essentially the company was defined as an industry by the Court. I'm thinking of the Alcoa case. And I don't recall any others on that.

* * * *

[2598] Q Do you know—I'm sorry. I will ask one further question.

[2599] Do you know whether Dr. Muller ever used that type of analysis?

A If you say he did, I will not question you. As I said, I wasn't there; I don't know.

Q You came in 1964?

A In September.

Q I gather your ultimate conclusion, Mr. Folsom, is that this merger or combination of the common ownership of these two companies will have an adverse impact on competition?

A My ultimate conclusion is that this merger has had an adverse effect on competition.

Now, as I stated earlier, if you were talking about divesting the company with no reserve, then a continuation of the—it seems to me from the economic standpoint—and again the competition—if you are going to divest the company with no reserves, either you are not going to have a gain to competition from the divestiture, and thus the continuation of the ownership would not be in that—given those two alternatives, adverse to competition.

* * * *

REDIRECT EXAMINATION

BY MR. CUSACK:

* * * *

[2607] Q I hand you what has been received into evidence as Government's Exhibit 52, which is a chart entitled "1967 Sales of Coal in the Eastern Interior Coal Province Sales Area by Coal Producers Located in Illinois, Producing District No. 10; Indiana, Producing District No. 11; and Western Kentucky, Producing District No. 9."

I ask you to examine this exhibit, sir, and on the basis of the exhibit to tell us your opinion as to the validity of the Government's choice of the Eastern Interior Coal Province sales area as one of the relevant economic markets in this lawsuit.

[2608] A I do not believe that this exhibit will stand alone—I do not believe standing alone it will justify seeing the Eastern Interior Coal Province Sales Area as a market. It gives you some basis for this, in that the percentages of production sold within the area, production by the companies in the Eastern Interior Coal Province, is fairly substantial in terms of their sales within the area; but you have to have the testimony from the people about the fact that they buy coal all over this area, etcetera, to justify saying this is an economic market.

[2609] Q This does not show, however, does it, that 82 percent of the coal sold in 1967—correct that, 82 percent of the coal produced in 1967 was sold in the Eastern Interior Coal Province Sales Area?

A Yes, it does.

THE COURT: Let me ask this one question. Are you through with that? I would like to ask a question.

MR. CUSACK: Yes, your Honor.

THE COURT: Considering Government Exhibit 53, in that it covers the Production Districts 9, 10 and 11, is there any part or portion of that that you would consider would be, from an economist's point of view, a more relevant market?

THE WITNESS: Than the Eastern Interior Coal Province—

THE COURT: Yes.

THE WITNESS: From the economist's standpoint, I think the state of Illinois is a better definition of a relevant market than is this.

THE COURT: Thank you.

THE WITNESS: If I may add, it is because of the transportation factor.

THE COURT: Yes. Proceed.

* * * *

[2612] Q Mr. Hedlund, during your cross examination, spoke to you about a statement at page 310 of the Economic Report of the Federal Trade Commission, saying that:

"There is high elasticity of substitution among

coal, fuel oil and natural gas as raw materials from which energy is produced."

Isn't it true, sir, that this statement was referring mainly to the eastern seaboard of the country?

A I don't recall that I wrote that statement, Mr. Cusack, and I don't know what the author of that statement had in mind. I read that statement. I think that it is more applicable to the eastern seaboard.

Q Isn't it true, Mr. Folsom, that in the state of Illinois and in the Eastern Interior Coal Province Sales Area there is not a high elasticity of substitution among the coal, fuel oil and natural gas as raw materials from which energy is produced?

A Historically there has not been a high elasticity of substitution in this area.

* * * *

[2613] show it to counsel.

THE COURT: Any objection?

MR. HEDLUND: I have no objection to identifying it, but—

MR. CUSACK: I have to identify it first, your Honor.

THE COURT: I thought it was identified.

MR. CUSACK: I wanted to show it to him first.

THE COURT: I thought you meant it was identified before but that you had not offered it. Is that correct?

MR. CUSACK: I believe I talked to him about it, but I am informed by my co-counsel that I did not do it right.

THE COURT: We will accept Mr. Braun's statement. Have it marked for identification.

MR. CUSACK: I will ask the reporter to mark for identification as GX-142 a schedule entitled "Commonwealth Edison Company Cost of New Generating Units, Edison Exhibit 1.7."

(Said document was marked as GX-142 for identification.)

MR. CUSACK: The Government moves the admission in evidence of GX-142 for identification.

THE COURT: Any objection?

* * * *

[2619] Alcoa as being a situation where you had had a one company industry essentially.

Q Alcoa, then having a monopoly over the production of aluminum?

A Of primary aluminum ingots.

Q Mr. Hedlund asked you on cross examination with regard to whether or not you could group the mines in the Southern Illinois Freight Rate District with the mines in the West Kentucky Freight Rate District. The evidence in this case shows, sir, that in 1967, of the total of 46,710,000 tons of coal consumed in Illinois, 3,150,000 tons originated in West Kentucky and 1,088,000 tons originated in Indiana.

Would this indicate to you that Illinois was an economic market to the exclusion of West Kentucky and Indiana?

A That alone would not indicate that Illinois was an economic market. It would be one of the factors considered.

Q Mr. Hedlund asked you with regard to whether or not any of the generating stations of the Union Electric Company were located in Illinois. Would it refresh your recollection if I told you that the Sioux Plant of Union Electric was located at Alton, Illinois, [2620] and the Venice Plant was located in East St. Louis?

MR. HEDLUND: I am going to object. Mr. Cusack knows full well that the Sioux Plant is not located in Illinois. It is located in Missouri. There is evidence in the record—

THE COURT: Do you accept that correction?

MR. CUSACK: I was relying on Dr. Steiner when he said it was in Alton yesterday. Perhaps we are both wrong.

MR. HEDLUND: I believe Professor Steiner—well, if he did, the record will show what he said, but the facts are clear that the Sioux Plant is not in Illinois.

THE COURT: Will you accept that amendment and then let him answer the question?

MR. CUSACK: I will withdraw the question. Dr. Steiner and I are wrong.

BY MR. CUSACK:

Q You testified, Mr. Folsom, that on the basis of the fact that most of the United Electric coal has been sold at the present time, it appeared that the anti-competitive affects of merger already had occurred, is that correct?

A I don't think that is exactly what I testified to. Shall I say what I testified to? I testified that [2621] most of the loss of competition which would be in part the anti-competitive effects was that you had had a loss from 1959 to this date. I think that there is an additional loss in that you lost the potential. What I testified to was with respect to the future, that if you took a company without any reserves and made it an independent entity, it would not be a big stimulus to competition.

Q So, would one of the anti-competitive effects of this merger be that United Electric—that the owners of United Electric—had not added to its reserve base as its coal had been mined and monies had been transferred from United Electric to its owner? Would this be an anti-competitive effect of this merger?

MR. HEDLUND: Your Honor, I am going to object. Even on redirect examination I think this is an overly-leading question.

THE COURT: He may answer.

[2622] BY THE WITNESS:

A I would not look at the transfer of money, because that is a financial operation. I consider it an anti-competitive effect that UEC's position in the coal industry was not expanded, either through acquiring additional strip reserves of the quality they now have or going into deep mining. The transfer of money is incidental, insofar as I as an economist would look at this.

BY MR. CUSACK:

Q Would you concede, though, that if United Electric had remained a separate company it would have had substantially more funds available to it to go into under-

ground mining or to acquire additional strip reserves?

MR. HEDLUND: I am going to object, your Honor. I think he gave the answer to the question that Mr. Cusack asked—

THE COURT: Objection sustained.

Standard & Poor's

INDUSTRY SURVEYS

Utilities Provide Growing Market for Bituminous

BITUMINOUS (soft) coal is a vital factor in industrial progress, even though competition from other fuels and changing technologies have reduced or practically eliminated demand in some formerly important markets and current output is some 19% below the record high achieved shortly after World War II. In recent years, demand has been trending upward. Production in 1965 was the largest since 1951 and further gains seem likely.

Coal is the principal fuel used in generating the tremendous quantities of low-cost electric power so necessary for industry, commerce, and a high standard of personal living. It is an indispensable element in large-scale economic production of steel, cement, and many chemicals. It is one of the few natural resources in which the United States is still a net exporter because of extensive reserves and comparatively cheap mining costs.

Coal's major and growing market is the electric power industry, where the fuel is burned to produce steam that in turn drives electrical generators. Electric utilities used 3.5 times more coal in 1965 than at the end of World War II. The sizable increase in demand for electric power projected through 1980 is expected to result in substantial further growth in coal usage, despite competition in some areas from oil, natural gas, and atomic power.

The longer-range threat to soft coal posed by nuclear power generation is expected to be greatest in areas remote from mine fields, where heavy transportation costs diminish coal's competitive advantage. On an overall basis, atomic power seems likely to supplement coal, rather than displace it entirely.

The impact of growing usage of coal in the utility field has been lessened by losses in other markets, particularly railroads and home heating where coal usage has contracted to such an extent that future declines will be relatively small. The steel industry is expected to remain a major consumer, but gains in blast furnace efficiency may offset the effects of a

moderate rise in steel production and the increase in blast furnace output demanded by newer steelmaking furnaces. Foreign markets hold some promise as a sizable but volatile outlet for metallurgical grade coal, since the U.S. product is fairly essential to steel producers in Canada, Europe, South America, and Asia.

On balance, substantially higher production of bituminous is indicated over the longer term, spurred mainly by increasing usage of electric utilities. By 1980, domestic coal output could approach 800 million tons, well above the record 631 million tons of 1947 and some 57% higher than in 1965.

Obviously, coal companies shipping most of their tonnage to electric utilities have the greatest future potentials. The mines best situated in this respect are in the east-central and central United States, where potential new demand is sizable and where the proximity of coal deposits, the availability of cheap transportation on inland waterways, and favorable mining factors enhance coal's competitive position.

Technology

Technological progress has sharply reduced some coal markets while other developments have enhanced the fuel's position. The most significant technical gains for coal have been the increasing efficiency of steam boilers and rising productivity in the mines. In 1945, utilities used an average of 1.3 pounds of coal to generate one kilowatt of electric power. By 1965, this ratio had been reduced to 0.86 of a pound. A further decline is possible as new and more efficient generating plants are placed in operation, but this increasing efficiency is expected to continue to be substantially outweighed by the expansion of power generation, which in turn is stimulated by the reduction in electric power costs to the consumer.

As to mining efficiency, daily output per man rose from 5.78 tons in 1945 to almost 17 tons in 1964. (Table 12). Further gains are indicated with increasing usage of continuous mining machines in underground operations and larger equipment in strip mines, as well as the increasing proportion of coal mined by more efficient strip and auger methods.

The most important technological advance in recent years has been in the area of new transportation concepts. The early stimulus of coal slurry pipelines and, more recently, unit and integral railroad trains and extra high voltage electric transmission lines have served to reduce the delivered costs of this bulky commodity. Extension of these and other new ideas seems likely to continue to cut future transportation costs. The position of coal may also be eventually improved by commercial conversion of coal into gasoline, pipeline gas, and other petroleum products, all of which are technically feasible.

Under the auspices of the Office of Coal Research of the Department of the Interior, Consolidation Coal is constructing pilot plants for the production of gasoline from bituminous coal and pipeline gas from lignite. Substantial research is being conducted in other areas by government agencies, industry associations, and individual companies, all aimed at developing new markets for coal.

Utility Demand

Electric utilities, which furnish the fastest growing mass market for soft coal, used about 243 million tons of bituminous in 1965, equal to 53% of total domestic consumption. Electric utility demand increased about 57% in the past ten years, while total domestic usage rose only 6%, mainly reflecting sharply reduced consumption by railroads and retail consumers and a moderate decline in coal needs of industrial customers. Utilization of coal for power generation increased in every postwar year, except

1946 and 1949, when strikes cut supplies, and 1958, when the recession and stiff competition from residual oil caused a moderate decline.

This national average conceals wide geographical differences. As indicated in Table 2, growth in electric utility usage in recent years was greatest in the East Central districts and in the South Atlantic states, where coal encounters the least competition from other fuels. While competition from residual oil continues to be strong, improved transportation concepts in both coal and electrical energy are currently allowing improvement in the Northeast; similar factors are also stimulating coal demand in the Mountain district.

Costs of fossil fuels per kilowatt hour average about 2.6 mills nationally, with coal slightly less, gas roughly the same, and oil at 3.5 mills. Hydroelectric power, when available, is generally somewhat cheaper. Compared with a decade ago, costs for coal have declined about 8%, oil costs are down about 10%, but the cost of gas has risen more than 25%.

As indicated by Table 2, natural gas is almost the exclusive fuel used in the Southwestern producing districts; usage in other districts is greatest in the summer, when heating demand is low and gas transmission companies offer utilities reduced prices to utilize pipeline capacity. Some domestic fuel oil is used in various producing districts, but a major part of the total supply is imported residual oil which is transported cheaply by water to both the East and West Coasts. Virtually no coal is used on the West Coast because of high transportatoin costs, but electric power generated at a coal fired plant in Nevada will be transported by high voltage lines to California beginning in 1970.

Quotas limit imports of residual oil, but these have been regularly increased in recent years and arguments for abandoning the quota system are gaining increasing support. Such a move would markedly increase competition from oil, particularly on the eastern seaboard.

Increases in steam boiler efficiency contributed to the modest decline in the cost of coal per KWH over the past ten years, along with improved mining methods and, more recently, reductions in freight rates. The amount of coal required to generate one KWH stood at 0.86 pounds in 1965, unchanged since 1961 but down from 0.95 pounds in 1955 and 2 pounds in 1925. Despite the absence of any appreciable change in this figure in recent years, eventual resumption of the longer-term down-trend is expected with the addition of new plants, most of which require less than 0.7 pounds per KWH.

Bituminous coal (together with a small tonnage of anthracite) accounted for 54% of total electric energy produced by utilities in 1965. Excluding hydroelectric plants, coal furnished 67% of power-generating requirements of utilities, with gas supplying 26% and oil 7%. Relative to oil and gas, coal's market position seems likely to be well maintained at least through 1980. Of the three fossil fuels, coal has the most favorable price trend and there is room for some doubt that reserves of gas and oil are sufficient to fill the anticipated sizable rise in utility fuel demand. However, after 1970, markets for all fossil fuels will probably be subject to some erosion from nuclear power (see below). Domestic generation of hydroelectric power may lose some of its position, due to exhaustion of available locations, although the possible importation of hydro-power from Canada could prove in part offsetting.

Note: See Current Industry Surveys for later data. N.A.—Not available.

Source:—U. S. Department of Interior, Bureau of Mines.

The Federal Power Commission has estimated that output of electricity in 1980 will be slightly more than three times that of 1960. The consumption of coal by electric utilities is not expected to rise as rapidly, largely because of the increasing importance of nuclear power generation, as well as some further gains in steam plant efficiency. These factors are expected to reduce coal's market share to 47% in 1980, compared with 54% in 1965. Despite this erosion, it is readily evident that the potential for absolute growth is sizable. Utility coal usage is thus projected at 500 million tons in 1980, representing an annual increase of almost 5% from the 243 million tons of 1965. Current and planned additions to generating capacity reinforce this longer-range projection and enhance near-term prospects. New conventional steam generating capacity totaling 11 million kilowatts was added in 1965, and current plans call for the installation of an additional 37.6 million KW by 1969; the latter is equal to about 16% of the total installed generating capacity at the end of 1965.

Nuclear Power Generation

Nuclear power at present is not a significant factor in the total power generation industry, as it accounted for slightly less than 1% of the installed steam capacity at the end of 1965. Nor is it expected to seriously affect coal's growth in this market through the end of the present decade. However, recent projections of total operating costs for nuclear power installations indicate that, by 1980, nuclear power may become fully competitive at most locations with fossil fuels (coal, gas and oil) in the generation of electric power.

Nuclear power offers two significant potential advantages over conventional fossil fuels; the ability to produce large quantities of electric power from small amounts of fuel, thus allowing generating stations to be located closer to load centers due to the absence of sizable fuel transportation costs, and operation without discharge of combustion wastes that would contribute to air pollution.

Of the nuclear plants in operation now, the most successful is the Rowe, Mass., plant of the Yankee Atomic Electric Co., which has net power costs of slightly under 10 mills per kilowatt hour, above the cost obtainable from new conventional capacity in the same area. However, costs of the planned Oyster Creek plant of Jersey Central Power (to begin operation in 1968) are projected at 3.79 mills per KWH at peak operation, well below the costs of a coal-fired plant at the same location and slightly less than power transmitted to the area from a Pennsylvania mine-mouth station. Similarly, Commonwealth Edison's 200,000 kilowatt unit, planned to start up in 1969, is expected to deliver power to the Chicago area at costs slightly lower than those of the company's newest conventional coal-fired plant.

Estimates by the Federal Power Commission indicate that costs of nuclear power generation, which is expected to supply 19% of total electric power requirements in 1980, may decline to levels in that year equivalent to fossil fuel costs per KWH of 1.1 to 1.7 mills. There continues to be wide geographic disparity in the economic advantage of nuclear power relative to coal, and the type of new capacity installed in future will vary according to plant location, with the greatest initial growth in nuclear power use expected in such high-cost coal areas as the Pacific Coast, where relatively no coal is used, and the Northeast, where oil and gas have important shares of the market. Coal costs per KWH, which averaged 2.5 mills in 1964, seem likely to decline, reflecting further gains in mine efficiency and reductions in freight rates, thus providing a moving competitive target for nuclear power. As a result, many observers feel that atomic power will supplement rather than replace coal in utility markets.

Steel Industry Demand

Steel producers provide coal with its second largest market and consume over 90% of coking coal (excluding exports). Coals from Eastern fields varying in volatile content are blended by steel companies and then carbonized into coke for use in the blast furnaces which separate iron from the major impurities contained in iron ore. Under present technology, coal is indispensable for large-scale, economic production of most steel grades but gains in blast furnace efficiency have seriously reduced the amount of coal needed in the steelmaking process, as shown in Table 5 by the decline in coke consumption per ton of steel produced.

Further reductions in coal use per ton of pig iron produced seem inevitable, reflecting increased availability of concentrated iron ores and gains in blast furnace efficiency stemming largely from injection of lower cost fuels (oil, gas or powered steam coal) into the furnace.

Over-all, coke usage per ton of pig iron has declined by about 30% since 1949 and some industry experts believe that further reduction of up to 50% are possible. One favorable technological development has been the growing usage of basic oxygen

steelmaking facilities which utilize a larger proportion of pig iron relative to scrap than do regular open hearth furnaces. On a longer-range basis, direct reduction of iron ore may become economically feasible. This would further curtail steel industry consumption of coking coal although additional quantities of steam grades might be needed for the large power requirements of direct reduction processes.

In producing one ton of pig iron in a blast furnace, about 1,310 pounds of coke are used, which is equivalent to around 1,900 pounds of coking coal. Coal is also used by steel companies for heat and power but this usage accounts for less than one tenth of the industry's consumption. Many steel and coke producers operate their own mines. This "captive" production supplies approximately two-thirds of total coal requirements. When steel production declines, commercial coal operators generally are adversely affected first, although contract terms do result in variances among companies.

Other Industrial Demand

Reflecting the increased availability of natural gas and fuel oil, consumption by merchant (non-steel) coke producers of metallurgical grades and demand for steam coal by other industrial users has been in a general decline through most of the postwar period. Substantial improvement is possible in certain markets, however, highlighted by expansion of cement production and also the use of steam plants for producing power used by aluminum companies.

Railroad and Retail Demand

Before and during World War II, railroads and retail consumers each accounted for over 20% of total domestic consumption. With dieselization, coal now accounts for only a nominal portion of total railroad fuel requirements. Coal use by railroads fell 98% from 1945 to 1960, or from 22% of total consumption to 0.6%; because of its lack of importance in coal markets, rail consumption has not been reported separately since 1960. Utilization of more efficient fuels in home heating precipitated an 84% decline in retail consumption from 1945 to 1965; the retail market amounted to 4% of coal consumption in the more recent year, down from 21% in 1945.

Export Markets

Metallurgical grades (particularly low-volatile) accounts for about 62% of exported coal, and the cyclical nature of demand for this type of coal is made more volatile by changes in shipping rates, import restrictions, and foreign exchange considerations. In the postwar years, exports ranged from 5% of U.S. production in 1950 to 13% in 1957, and accounted for about 10% of output in 1965.

Sources: Bureau of Mines and Bureau of the Census.

Canada has historically been the largest single foreign market for U. S. coal, and is expected to remain in this position for some time to come. However, with the increasing development of oil and natural gas resources and of pipeline networks, dependence on imports has lessened; in the past ten years, U.S. coal exports to Canada fell 24%. Overseas shipments hit a peak of 58 million tons in 1957, reflecting the fuel shortages stemming from the Suez crisis, but dropped sharply in 1958. However, shipments have trended generally upwards since 1960, amounting to 34.5 million tons in 1965. Countries in the European Common Market, which take about 42% of total exports, are the largest overseas outlet, followed in importance by Japan.

Most U.S. coal shipped to the Common Market is for metallurgical use, although some steam coal is also shipped and a fairly sizable portion of the metallurgical coal is gasified by gas utilities before the resultant coke is sold to steel makers. Even with the addition of ocean shipping rates to the U.S. prices, U.S. coal is often quite competitive with domestic coal in Europe, due to the low productivity of European mines (generally around 5 tons per man day, versus about 17 tons in the U.S.). However, to protect their producers from competition from imported coal and oil, most European nations have enacted stiff fuel import quotas, which have restricted this market for U.S. coal.

U.S. exports to Japan rose sharply in recent years, reflecting largely the growth in steel production there and limited domestic supplies. However, prospects for further expansion are not as bright, as the growth rate of the Japanese steel industry will probably decline, while lower transportation costs and the development of extensive reserves make coal from Australia increasingly attractive.

Prices; Contracts

The level of business activity, seasonal variations in demand, labor disturbances, and the availability of railroad cars cause fluctuations in coal prices. The price structure is based on the grade and quality as

well as the quantity taken. Prices of competing fuels are also important.

Coal is often sold to utilities under long-term contracts at fixed prices (with escalation clauses) or by some on a cost-plus basis. Long-term contracts are most important in the Midwest, with the contracts running to 20 years and over. Many eastern utility contracts are still on a annual basis, commencing in April, but longer terms are becoming more important and are often made in conjunction with arrangements with railroads for reduced rates on trainload lots.

In recent years, the price structure in eastern non-utility markets has been weakened by competition from non-union producers (whose low labor costs offset low productivity), residual fuel oil, and dump gas in the summer months (due to absence of space heating uses). In addition, metallurgical coal is often sold at reduced prices in steam markets when steel industry demand is low.

The rise in steel industry operating rates since 1963 and sharply higher utility demand allowed moderate price increases in eastern utility markets in early 1966. Midwestern prices continue firm, with competition coming mainly from gas. The absence of significant price increases has narrowed industry profit margins somewhat, but it has also allowed coal to win new customers in the electric utility industry. Large-scale producers have achieved a partial offset through increased mechanization; absence of labor cost increases in 1960-63 also aided in countering declining prices in those years.

Types of Coal

Coal, which constitutes 87% of the nation's proven fossil fuel reserves, is classified as anthracite, bituminous, subbituminous, and lignite. Anthracite, or hard coal, is nearly 90% carbon with only a small amount of volatile elements. Bituminous, with a lower fixed carbon content, is ranked as high, medium, or low-volatile, depending upon the proportion of bitumens or volatile elements which are released by heat. Subbituminous contains 15 to 30% moisture and has a lower B.t.u. content than bituminous. Lignite, the youngest coal geologically, has more volatile elements and moisture than any of the others and a lower carbon content. Lignite production is relatively small in the United States; in Europe, it is an important fuel.

Commercially, bituminous coal is rated as *metallurgical* and *steam* grades. Metallurgical coal (which is simply a coal that can be made into coke economically) softens and runs together when heated in a sealed oven. The volatile elements are driven off, leaving coke, a porous mass of nearly pure carbon (which produces a more intense heat than the volatile elements). In making coke, high volatile bituminous coal (averaging about 36% volatile matter) is usually blended with low volatile bituminous (about 18% volatile content), with low volatile accounting for 15%-20% of the total. However, medium volatile coal (about 26% volatile content) is fairly often used as part of the blend, and occasionally makes up the major part of it. Low volatile bituminous coal is relatively scarce, and often commands a premium price.

The main use for coke is in making pig iron, most of which, in turn, is converted into steel. Steam coal's principal use is in boilers, the energy produced being then directed to heating or processing. Metallurgical coal can be used in place of steam coal, although such substitution is costly; steam coal, however, cannot replace metallurgical grades.

Productivity

Daily output per man amounted to 16.8 tons in 1964, and was probably in excess of 17 tons for all of 1965. Expanded utilization of continuous mining and loading machines has increased output per man-day by more than 11 tons since the end of World War II; in the period from 1900 to 1945, only 2.8 tons were added to daily productivity.

High wage rates are a strong incentive for increased usage of power cutters and drills, loading machines, and all types of conveyors and shuttle cars. The number of continuous mining machines in operation increased markedly in recent years; these now account for about 39% of total underground production and further increases are expected. Pick-and shovel mining has virtually disappeared from underground mines (except for small non-union operations) and now only about 4% of coal is cut by hand and only 12.5% is loaded non-mechanically.

Mechanization of mines has resulted in more foreign matter being mixed with coal. When most operations were performed by hand, miners separated non-coal elements. To overcome this problem, preparation plants now clean over 63% of total coal produced, compared with 28% in 1947 and 8% in 1930.

Productivity has always been high in strip mines because of the size of the equipment and the relatively few men needed for operations. Output rose from 15.5 tons per man day in 1945 to 29.3 tons in 1964, while underground productivity increased from 5 tons daily to 14 tons. Some strip mines have a production rate of above 50 tons per man. These mines are mostly in the Midwest, where lower grade coal requires higher productivity for profitable operations.

Underground Mines Vs. Strip Mines

Underground mines supplied 66% of total output in 1965, with strip and augur mines accounting for 31% and 3%, respectively. In underground mining, coal is cut, blasted loose with explosives or compressed air, loaded on conveyors or cars and carried up to the surface. Continuous mining machines and accessory equipment consolidate these operations and allow a more uninterrupted flow of coal from the mining faces as well as much higher productivity. In underground production, generally about 50% of the coal is left to support mine roofs; in some areas, better roof conditions allow removal of more than 80% of the coal.

Strip (open pit) mining consists of removing overburden from coal seams relatively close to the surface with huge electric shovels capable of moving up to 140 cubic yards of dirt and rock in one bite. Smaller power shovels load the coal (which is usually loosened by explosives) on trucks for removal to preparation plants or customers. Output of strip mines was relatively small until World War II. During the past decade stripping production, while somewhat erratic, displayed a moderate upward trend. Coal obtained by this method is generally a cheaper grade but nearly 100% of the seams can be recovered.

When the overburden in a strip mine gets too thick to be removed economically, augur methods are used. These consist of drilling large holes into coal beds with augurs. It is relatively inexpensive and permits recovery of up to 65% of the coal.

Transportation Costs

Because of its bulk, costs of delivering coal to customers are an important part of total costs to the consumer. In 1965, the average value of coal at the mines was $4.45 a ton, but the average railroad freight charge added to the delivered cost was about two-thirds of this. Thus, a company could produce a higher grade of coal at a cheaper price than a competitor, but nearness to the ultimate consumer could allow the competitor to deliver his coal at a lower price per B.t.u., which is the chief determinant of fuel economy for a utility.

Close to 72% of the coal produced is moved from mines by rail. Shipments by water total only 12% of original movements but a substantial portion of coal is transferred to barges and other vessels before it reaches the ultimate user. Barge tows carrying up to 25,000 tons of coal ply the inland waterways, particularly the Monongahela, Allegheny, Kanawha, Ohio, and Mississippi Rivers. In addition, substantial tonnages are shipped over the Great Lakes and coastwise along the Atlantic seaboard. Over 13% of mine output is carried by trucks, particularly from strip and augur mines.

New Transportation Methods

To reduce or eliminate the sizable competitive disadvantage posed by the high costs of transporting coal from the mines to distant consumers, producers are striving to find cheaper methods of getting coal to its markets. At present, the most notable example is the reduced rail freight rates offered on whole train loads of coal moving from a single or small number of mines to a single utility. First used in 1962, train load methods provide cost savings of up to 20% and their use has been accelerating. More recently, the "unit" train concept has been initiated, wherein a train made up of cars owned by a utility or a coal producer operates between one mine and one generating plant. Special equipment allows rapid loading, unloading and turn-around time, and cost savings often amount to 50%. Even greater economies are expected from the planned "integral train", which will use permanently coupled large cars, heated and insulated and equipped for rapid loading and unloading. Planned train loads of up to 35,000 tons compare with the 7,000 to 10,000 ton capacities currently in use.

To avoid the cost of carrying coal in bulk form, some utilities are locating generating stations near the mines, and transmitting power over long distances. Power losses are a problem, but technological improvements often allow sizable savings. Such "mine-mouth" power plants are now coming into use in connection with regional power grids, which connect a number of utilities and allow power interchanges as well as the distribution of the power from the mine-mouth plants.

Another method of coal transportation that has aroused considerable interest is the movement of a coal slurry (made up of coal and water) through a pipeline. One such pipeline was in successful operation in Ohio in 1957-63, and several others have been proposed in various parts of the country. However, the reduction in rail freight rates, which was the apparent cause of the Ohio pipeline shut-down in 1963, has stalled the installation of additional units in the East. In the West, however, a pipeline is being considered for transporting coal to a new generating complex in Nevada.

Leading Producers

Despite the concentration of mining in a few states, small companies operating only one or two mines are typical. Peabody Coal Co. and Consolidation Coal Co., the largest commercial producers, accounted for less than 10% each of total bituminous output in 1965. About 15% is produced by "captive" mines owned by steel companies, utilities, and other large coal users. U. S. Steel's mines produced 18 million tons in 1965, or 3.5% of total production.

Large mines account for a disproportionate share of total output. The latest available figures reveal that about 3% of the mines in operation produced more than 500,000 tons of coal annually and contributed 55% of total tonnage. Some 6% of the mines turned out 100,000 tons to 500,000 tons for 23% of national output; 37% produced 10,000 to 100,000 tons for 19%; and 53% of the mines dug less than 10,000 tons for 3% of overall production.

Increased capital needs for opening and mechanizing mines plus rising wage rates have resulted in a trend toward consolidations. With the economies offered by large-scale operations, further concentration is likely. The number of operating mines declined from a high of 9,400 in 1950 to 7,600 in 1965.

Reserves

Recoverable coal reserves in the U. S. were estimated at 830 billion tons in 1960, consisting of 455 billion tons of bituminous, 365 billion of subbituminous and lignite, and 10 billion anthracite. At the present rate of consumption, bituminous reserves would be sufficient for over 1,500 years and anthracite deposits for over 500 years. About 200 billion tons of total reserves are regarded as economically recoverable at or close to present costs. These deposits make up more than one-third of the world's presently recoverable supplies.

Practically all U.S. anthracite is located in Pennsylvania. Principal bituminous reserves ranked by size are in Illinois, West Virginia, Missouri, Pennsylvania, Kentucky, Colorado, Ohio and Indiana. However, in order of production, West Virginia is the leader with 30% of 1965 output, followed by Kentucky and Pennsylvania, 16% each, Illinois 11%, Ohio 8%, and Virginia 7%.

The principal deposits of subbituminous coal and lignite are in North Dakota, Montana, Wyoming, Washington, Alaska, and New Mexico.

Labor Relations

Following years of bitter strife, relations between coal management and the United Mine Workers (led by John L. Lewis until 1960) have been quite harmonious. No industry-wide strike has occurred since 1949, union leaders cooperate with management in settling wildcat and other local strikes, increasing productivity has been encouraged, and wage increases were passed up in several new contracts because of the industry's problems. Actually, non-union coal miners are now a major concern of the large commercial coal companies, since these mines (usually small and marginal operations) have grown to account for roughly a quarter of total output and contribute considerably to price weakness, particularly in the East and South.

The labor agreement signed in 1964 calls for payment of a double welfare and retirement fund royalty by major coal companies for any non-union coal marketed by them. The 1959 labor contract prohibited marketing of non-union coal, but little success was acheived as chronically unemployed miners are willing to accept low wages or work as independent contractors at non-union properties. These mines could not operate if they paid the union scale wage rates and the $0.40 a ton royalty charge (this payment is larger than most companies' profit per ton and has led to omission or reduction in fund payments by some union mines under so-called "sweet-heart" contracts).

A new contract was being sought by union leaders in early 1966, but no settlement had been reached at the date of this writing. Union demands indicated a greater emphasis on fringe benefits and a total package somewhat in excess of the $2 a day granted in the 1964 pact.

As over-all markets for soft coal contracted and companies stepped up mechanization to offset higher wages and thus maintain coal's competitive position, employment at the mines dropped drastically. Even with the resumption of the uptrend in output in recent years, employment figures have continued to decline. In 1964, the working force averaged 128,700 in soft coal, compared with a postwar peak (1948) of 442,000. In the anthracite region, employment in 1964 was down to about 13,000, or a decline of about 60% from that of 1955.

Anthracite

Markets

The nation's anthracite industry, concentrated in four mining fields in eastern Pennsylvania, has been in a marked downtrend during the postwar years because of the loss of its major market, space heating, to oil and natural gas. Entry into industrial markets on a profitable and large-scale basis has not been possible for anthracite producers since the characteristics and geological formation of hard coal have precluded mechanization to the extent achieved in bituminous, and the resultant lowering of production costs. Production in 1965 declined 10% to 15.4 million tons. The total was 26% of 1926 output, only 15% of the record 100 million tons of 1917, and was roughly the same as anthracite production in 1866.

The majority of anthracite output is still used for space heating purposes in its main marketing area north of the Potomac and Ohio rivers and east of the Mississippi. This is where anthracite has lost its position, now accounting for about 8.5% of total fuels consumed in these states as compared with 83% in 1929. Oil and natural gas increased their respective shares of this market to about 64% and 28%, compared with 8% and 5% in 1929. Further losses seem probable for anthracite.

Cheap transportation costs make anthracite an economic fuel for some electric utilities in Pennsylvania. In 1964, some 14% of total output was used by electric power stations. Part of the anthracite is obtained from dredging rivers (particularly the Susquehanna) where fine coal has accumulated as a result of dumping upstream by coal breakers. The dredged coal is quite cheap, as exemplified by the

Holtwood steam station of PENNSYLVANIA POWER & LIGHT, where dredged coal costs the company approximately $2.70 a ton. As a result, fuel costs of this station are less than half those of the average Pennsylvania plant and are among the lowest of any of the nation's major steam plants.

Utilities offer little hope for the commercial coal producers, however, since the fine sizes used in boilers are not profitable except as a by-product or co-product of the higher-priced large sizes. The same is true of other industrial markets for fine anthracite, except where it can be obtained at little cost, as in dredging or recovery from waste banks.

A small amount of anthracite is added to bituminous in some ovens in making coke. Increased usage of anthracite is expected in pelletizing taconite but this market again requires the fine and least profitable sizes. Exports of anthracite have become more important, reflecting shipments to U.S. military forces in Europe, but fluctuated widely in recent years. Foreign demand seems likely to continue to be irregular. Canada is still an important though declining market.

Production; Costs

Anthracite deposits generally are not level as are bituminous seams but run at angles which sometimes are over 60%. These pitched seams preclude utilization of continuous mining machines and other mechanical improvements that have contributed so greatly to the marked gains in productivity in soft coal mines. Average output per man day in the hard coal fields is about 6.1 tons, compared with more than 17 tons in bituminous mines. This compares with 3.79 tons at the end of World War II; much of the improvement stems from a higher portion of production from strip mines as well as closing of high-cost underground properties. Strip mines now account for about 42% of output, underground mines for 34%, waste banks for 20%, and river dredging for 4%.

Hourly wages at anthracite mines average about a half dollar less than at soft coal mines but the union welfare and retirement fund payment is $0.70 a ton, against $0.40. Non-union production of anthracite is sizable.

After mining, the hard coal is processed in breakers or washeries which remove foreign matter and size the coal. The large sizes ranging from 3 inch broken grades to 1⅝-inch chestnut generally sell for over $12 a ton at the mines. Pea and the larger buckwheat sizes are priced between $9 and $11 a ton, and the finest buckwheat sizes sell for less than $3 a ton.

With wage, pumping (at undeground mines), and material costs rising at a time when demand for the more profitable larger size coal is dropping, profits for fully unionized hard coal producers have become quite meager. No reversal of the present drab situation is seen.

Composite Industry Data

*NOTE: All of the per share data herein are expressed in terms of the S & P Stock Price Index, i.e., stock prices, 1941-43=10. The yield is first obtained, this being the aggregate value of all dividend payments divided by the year-end aggregate market values on which the stock price indexes are based. This yield is then applied to the year-end stock price index, giving the indicated per share dividends in terms of the S & P Stock Price Index. Thus, a yield of 5% applied to a stock price index of seventy would indicate dividend of $3.50 "per share" on the index. All other items (totals) are then related to the total dividend payments. So, if total sales amount to fifteen times the total dividend payments, then, with "per share" dividends at $3.50 the indicated per share sales will be (15 x 3.50) $52.50 in terms of the S & P Stock Price Index. For comparability between the various groups, all data are on a calendar year basis, corporate data being posted in the year in which most months fall. Fiscal years ending June 30th are posted in the calendar year in which the fiscal year ends. †Current assets less current liabilities, without allowance for long-term debt. [1]Peabody Coal added; United Electric Coal dropped.

Comparative Company Analysis

Revenue Record

BITUMINOUS COAL—Mergers distort the sales records of major producers, but the Midwestern steam coal producers (PEABODY, UNITED ELECTRIC, and AYRSHIRE) have outstanding records. Current sales of other producers (mainly eastern) are below peaks attained during the Suez crisis, but a recent uptrend has been sparked by sharply higher demand in utility and export markets.

Profit Margins

BITUMINOUS COAL — PEABODY and UNITED ELECTRIC COAL have the widest profit margins in the industry, reflecting operations of low-cost strip mines and the firm price structure for utility steam coal in midwestern markets (heavy development and other non-recurring costs were responsible for the 1965 decline in the latter's spreads). Mechanization and other cost reduction moves by most eastern producers have countered increases in labor costs and some price weakness, with CONSOLIDATION'S performance providing a notable example. Both PITTSTON and EASTERN GAS & FUEL have attractive records, the lower margins of the former reflecting the smaller return on sales of its non-coal operations.

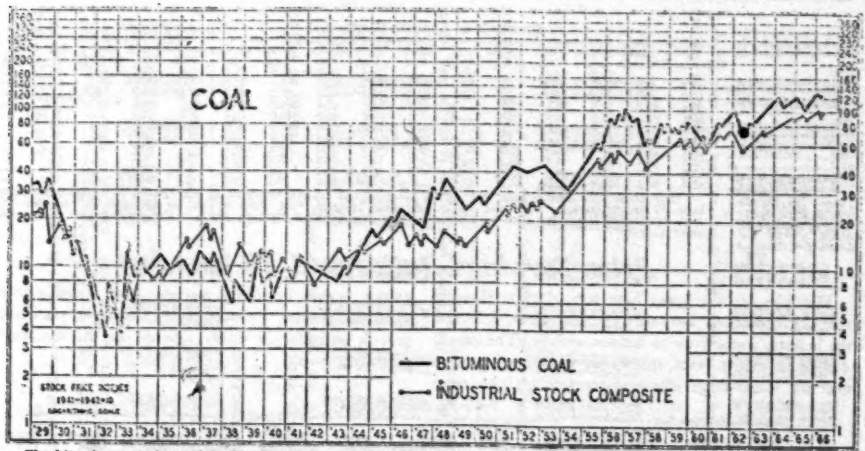
[6]Based on combined data. *Operating Income is usually the balance left from revenues after deducting operating costs, selling general, and administrative expenses, local and state taxes; provision for bad debts and pensions; but before other income and before deducting depreciation charges, debt service charges, if any, Federal taxes, and any special reserves. N.A. Not available.

Net Income Ratios

BITUMINOUS COAL—PITTSTON has an above average long-term record of profits growth, reflecting increased trucking, and oil distribution profits through internal expansion and acquisitions, and more recently, the marked improvement in coal profits. Returns of the two largest producers, PEABODY and CONSOLIDATION, have shown the greatest gains, reflecting the superior financial and reserve positions of both.

The 1963 drop in net of EASTERN GAS & FUEL reflects the exchange of its investment in Norfolk & Western R.R. for a nearly commensurate portion of its equity. The UNITED ELECTRIC decline in 1965 was due largely to the non-recurring factors that adversely affected its profit margins.



The bituminous stocks used in Standard & Poor's price index are: Consolidation Coal, Island Creek Coal, North American Coal, Peabody Coal Co., and Pittston Co.

DEFINITION—Net Income is simply the net profit after all charges as reported by the company.

Dividend Policies

Coal producers as a group have followed fairly conservative policies, although maintenance of payments in periods of cyclically reduced earnings resulted in high payouts in some years. Capital needs for expanding capacity have limited the payouts of some companies. EASTERN GAS & FUEL eliminated cash payments in 1963, but has followed a policy of steadily reducing its number of shares outstanding through purchases.

Price-Earnings Ratios and Yields

Multiples for the group have been close to those of the 425 Industrials composite in most years, reflecting the industry's sensitivity to business activity. The overall decline in recent years appears to stem from concern over the longer-range effects of competition from other energy sources in utility markets. The above average valuation granted PEABODY stems from the significant growth potential in utility demand in the company's marketing area.

Re: United States v. General Dynamics, et al.

Dear Mr. Cusack:

In connection with paragraph four of my letter to you of March 20, 1968, I enclose herewith the additional information requested with respect to payment of dividends by UEC. I am advised that UEC neither declared nor paid any dividends in 1967.

In connection with paragraph seven of my letter, I also enclose a copy of the proxy statement issued in connection with the acquisition of Material Service Corporation by General Dynamics.

Yours very truly,

Reuben L. Hedlund

Re: United States v. General Dynamics, et al.

Dear Mr. Cusack:

Pursuant to paragraph 18 of the Government's draft Motion to Produce and paragraph 4 of my letter to you of March 20, 1968, this is to advise you that the following loans were made by UEC to General Dynamics between January 1, 1950 and present time: (1) on September 22, 1966 a loan in the amount of $1 million at 6 per cent interest due December 30, 1966; and (2) a loan in the amount of $1 million on October 31, 1966 at 6 per cent interest due December 30, 1966.

Both loans were repaid on December 29, 1966. UEC has never made any loans to either Freeman or Material Service.

I must correct information transmitted to you with my letter of March 26, 1968. I am now advised that UEC declared and paid, on January 24 and 25, 1968, respectively, a dividend in the amount of $1,500,000 to General Dynamics. No other dividends were declared or paid during 1967.

I apologize for the error, which was caused by the failure to include dividends paid by the "new" UEC as well as those by "old" UEC.

Yours very truly,

Reuben L. Hedlund

EXECUTIVE OFFICE OF THE PRESIDENT / BUREAU OF THE BUDGET

STANDARD INDUSTRIAL CLASSIFICATION MANUAL

1967

PREPARED BY THE OFFICE OF STATISTICAL STANDARDS

* * *

Major Group 12.—BITUMINOUS COAL AND LIGNITE MINING

The Major Group as a Whole

This major group includes establishments primarily engaged in producing bituminous coal or lignite. Included are mining operations and preparation plants (also known as cleaning plants and washeries) whether or not such plants are operated in conjunction with the mines served. The production of coal fuel briquettes and packaged fuel is classified in Major Group 29, and the production of manufactured gas from coal in Industry 4925.

Group No. Industry No.

121 BITUMINOUS COAL AND LIGNITE MINING

1211 Bituminous Coal

Establishments primarily engaged in producing bituminous coal or in developing bituminous coal mines. This industry includes underground mining, auger mining, strip mining, and coal cleaning, crushing, screening, and sizing plants, whether or not operated in conjunction with the mines served.

Cleaning plants, bituminous coal
Coal mining, bituminous
Crushing plants, bituminous coal
Hard coal mining, except Pennsylvania anthracite
Screening plants, bituminous coal
Semianthracite mining
Strip mining, bituminous coal: except on a contract, fee, or other basis
Subbituminous coal mining
Washeries, bituminous coal

1212 Lignite

Establishments primarily engaged in producing lignite or in developing lignite mines.

Brown coal mining
Lignite mining

1213 Bituminous Coal and Lignite Mining Services

Establishments primarily engaged in performing for others on a contract, fee, or other basis bituminous coal and lignite mining services, such as the removal of overburden, strip and auger mining, drilling, shaft sinking, and mine tunneling.

Auger mining services, bituminous or lignite: on a contract, fee, or other basis
Bituminous coal mining services: on a contract, fee, or other basis
Draining or pumping bituminous coal and lignite mines: on a contract, fee, or other basis
Drilling for bituminous coal and lignite mining: on a contract, fee, or other basis
Lignite mining services: on a contract, fee, or other basis
Mine tunneling, bituminous coal and lignite: on a contract, fee, or other basis
Removal of overburden for bituminous coal: on a contract, fee, or other basis
Sinking shafts for bituminous coal and lignite mining: on a contract, fee, or other basis
Strip mining, bituminous coal: on a contract, fee, or other basis
Stripping services, lignite: on a contract, fee, or other basis
Tunneling, bituminous coal and lignite mining: on a contract, fee, or other basis

Appendix D

Criteria for Recognizing Industries in the Standard Industrial Classification

General Comments

The Standard Industrial Classification defines industries in accordance with the existing structure of the American economy. An industry is a grouping of establishments primarily engaged in the same or similar lines of economic activity. In the manufacturing division, the line of activity is generally defined in terms of the product made, materials consumed, or process of manufacture used.

Sometimes a common process of manufacture may result in an industry of considerable size and a wide variety of products; e.g., meat packing, and blast furnaces, steel works and rolling mills. In other instances, the production of an industry may be limited to a single product, such as chewing gum or wallpaper. To be recognized as an industry each group of establishments must have significance from the standpoint of number of production workers, value added by manufacture, value of shipments, and number of establishments. Size of an industry is not the sole criterion for its recognition; it is also important that an industry comprise a group of establishments of which the output of products or processes defining the industry (primary products of the industry) account for a relatively high proportion of (a) the total shipments or receipts of the industry (specialization ratio), and (b) the total output by all industries of the products or processes which are primary to the industry (coverage ratio).

The quantitative standards for size, specialization and coverage for manufacturing industries that have been established are described in subsequent paragraphs. There may be a few instances where other important considerations will warrant the establishment or retention of an industry which does not satisfy size, specialization, and coverage criteria.

As a result of the application of these criteria, there will be "leftover" segments of American industry. Lines of business activity which do not satisfy the criteria for the recognition of an industry, if they are very closely associated with the activities of another industry, may be included with that industry. This may have the effect of reducing the specialization ratio of the industry with which this line of activity is combined, but such a procedure may be preferable

to including the line of activity in a "miscellaneous" or "not elsewhere classified" category for that particular three digit group. Each case must be evaluated on its own merits. It may be better to allow a small element of impurity to be introduced into a given four digit industry by associating it with a line of activity which is quite closely related rather than to increase the size of the "miscellaneous" category for the three digit group by adding another line of activity, since the "miscellaneous" categories are heterogeneous and are not representative of any specific industry.

Standards for Criteria

As a result of the Census of Manufactures, data (number of establishments, employment, value added, etc.) are available for manufacturing as a whole. Knowing the number of industries, values for each desired item have been calculated for an "average" industry. These values for the "average" industry were used as the basis for measuring size. For each desired item, a number of points were awarded an industry, depending on the industry's relationship to the size of the "average" industry. The points awarded were equal to the percent of the "average" industry. The points for the various items were averaged with a system of weights to secure the final score for an industry. The score determines whether the industry is to be considered sizable or not.

Size Criteria:

Size was measured by a comparison of four items as follows:

1. Number of employees
2. Value added by manufacture
3. Value of shipments
4. Number of establishments

Number of employees and value added are recognized as being more significant and reliable measures of industry size than are value of shipments and number of establishments. Value of shipments includes the value created in other industries or other economic divisions such as Agriculture, etc., and does not measure value of income produced in the specific manufacturing industry. In some instances, the large duplication of value of shipments within an industry makes publication of the figure meaningless. A count of establishments in each industry is of limited significance as it treats both large and small establishments as of equal importance. In addition, the derivation of an "average" number of establishments per industry reflects, to a large extent, the very numerous plants in a relatively few industries. For example, five industries (Bakeries, Sawmills, Newspapers, Commercial Printing, and Concrete Products) account for approximately 22% of the number of establishments, but only 8% of the number of employees and value added by manufacture.

Generally speaking, an existing Standard Industrial Classification industry is considered as sizable if it attains a point score of 10 or higher. The point

* * *

The Consumption of Fuel by Steam-Electric Plants in the Eastern Interior Province Sales Area for the Years 1960-1967

Year	Notes	Per Cent of Consumption in BTU		
		Coal	Oil *	Gas *
1960	1	93.8	00.2	06.0
1961	2	90.5	00.1	09.4
1962	3	90.2	00.1	09.7
1963	4	90.4	00.1	09.5
1964	5	89.9	00.1	10.0
1965	6	91.4	00.1	08.5
1966	7	93.1	00.2	06.7
1967	8	92.2	00.2	07.7

* In Kurtz Deposition Exhibits 1 and 2, which cover the years 1960 and 1961, the BTU values for gas and oil are not shown for each generating station as is done in Kurtz Dep. Ex. 3-8. In the "Explanation of Tables" in Kurtz Dep. Ex. 1 and 2 appears this statement:

> "The BTU of fuel oil and of natural gas are not shown as the values in the great majority of cases were fairly well standardized, i.e., at between 147 and 153 thousand BTU per gallon of oil, and 950 to 1,050 BTU per cubic foot of natural gas."

The averages of 147 and 153 or 150 thousand BTU per gallon of oil, and 950 and 1,050 or 1,000 BTU cubic foot of natural gas were used to convert gallons of oil and cubic feet of gas to BTUs for the years 1960 and 1961.

Attention: Mr. John T. Cusack

RE: United States v. General Dynamics Corporation et al., Civil No. 67 C 1632 (N. D. Illinois)

Dear Sir:

As our Lakeside Generating Station is a coal burning plant we have no answers for paragraphs 2, 3 and 4. Data for our answer to paragraph 1 is attached herewith.

An engineering answer to a legally phrased question has presented unanswerable questions. You ask, "Please state the annual BTU and kilowatt hour output derived from each supplier, and the percentage of total (all sources) BTU and kilowatt hour output each supplier represents for each of the years 1964 through 1967."

We buy coal from several suppliers under contracts for terms from one to three years. Each contract has the following:

1. Guaranteed cost in dollars per ton F.O.B. mine.
2. Cost of haulage in dollars per ton - mine to Lakeside.
3. Guaranteed BTU's per pound.
4. Guaranteed moisture content.
5. Guaranteed ash content
6. Guaranteed sulphur content.

from item 1 and 3 the guaranteed cost F.O.B. mine in dollars per million BTU can be calculated.

Released
62-0-37-1200
DEPARTMENT OF JUSTICE
MAR 22 1968
DIVISION OF RECORDS

All coal is sampled as received at Lakeside, analyzed by a commercial testing firm for BTU, moisture, ash and sulphur. Based on contract stated per missable percentage deviations of each value of the analysis the cost of that shipment of coal is determined to be: (a) contract price, (b) contract price plus a bonus, or (c) contract price minus a penalty. If either party is not satisfied with the pricing because of a bonus or penalty a referee sample is sent to another commercial firm and the pricing is then recalculated.

Our experience has been for all suppliers that there are few bonuses and many penalties. As an example for 1967 only on the semi-monthly coal shipments and billings:

Peabody had 3 bonuses and 4 penalties,
Freeman had no bonuses and 12 penalties,
Little Dog had no bonuses and 24 penalties,
Royal Fuel had no bonuses and 24 penalties.

It should be noted that these bonus or penalty determinations are based on BTU, moisture, ash and sulphur, hence the existence of a penalty does not always indicate a low BTU content as many were due to moisture and ash penalties.

After the coal is received and tested it goes into either the active coal storage or the reserve coal storage. As the coal is used it is taken from either pile, but mostly from active storage, and put into the bunkers to feed any of the eight boilers for any of the seven generators. For this reason it is impossible to give the KWH generated from each coal supplier, and the B.T.U. supplied by each supplier for these KWH.

Hence the attached data gives the tons bought from each supplier, the cost of coal including bonuses and penalties and the gross generation for the year in KWH. It should be noted that the total tons of coal bought for the year did not exactly produce the total gross generation in KWH for that year because of additions or removals of coal from reserve storage.

We have no data as referred to in paragraph 5. Without surveys or memoranda as supporting evidence we can say that we

have always been a coal burning utility. In the earlier years all our coal came from Springfield mines or Sangamon County mines near Springfield, which was both good business and politically wise to patronize local coal firms. As the Springfield and Sangamon County mines were mined out, we of necessity have to go farther for our coal. As for oil we have always been too large for diesel generation. As for nuclear generation we were too small to consider it and considering the increasing size of nuclear units that are now being planned or installed, we will be too small for many years to come. As for gas as boiler fuel it was both more expensive than local coal and unavailable.

Very truly yours,

C. P. Hafel

Re: United States v. General Dynamics Corporation et al., Civil No. 67 C 1632 (N. D. Illinois)

Dear Mr. Turner:

In response to your letter of February 26, 1968, we are enclosing information as you have asked relating to our fuel purchases.

At this writing we have not completed calculating the information to give the BTU and Kilowatt Hour output derived from each supplier, etc., as asked for in Paragraph (1) one of your letter. We hope to send this to you within the next couple of days.

Very truly yours,

A. Kraakevik
Vice President

DEPARTMENT OF JUSTICE
MAR 13 1968
DIVISION OF RECORDS

Decatur, Illinois
March 12, 1968

Illinois Power Company
Generation by Other than Coal Energy Sources

Coal -- with the exception of interruptible gas at one generating station -- has an economic advantage over other energy sources in our service area under present conditions.

Gas for electric generation is supplied to 6 of our boilers on an interruptible basis and, therefore, is on a seasonal basis. Interruptible gas available to 2 boilers which were equipped last year for gas firing is economical when compared to the coal available to these boilers. Gas supply information is listed below for the years 1964 through 1967.

		BTU's Consumed		Approx. KWH Output (*)	
Year	Cost	BTU's (10^{-6})	% Total	KWH (10^{-3})	% Total
1964	$478,527	2,370,072	4.1	215,000	3.9
1965	212,339	1,051,635	1.5	94,000	1.4
1966	91,425	425,541	0.6	39,000	.6
1967	375,879	1,789,798	2.5	167,000	2.4

*Gas when available and when economically advantageous is normally used coincidentally with coal. Therefore, the kilowatt hour output produced by gas must be approximated.

Fuel oil is used at three small peaking plants of which one was installed last year. The millions of BTU's consumed, the cost thereof and kilowatt hours produced therefrom during the years 1964 through 1967 were as follows:

		BTU's Consumed		Kwh Produced	
Year	Cost	BTU's (10^{-6})	% Total	KWH (10^{-3})	% Total
1964	$ 533	707	.001	53	.001
1965	519	657	.001	57	.001
1966	1,844	2,278	.003	194	.003
1967	9,656	12,617	.018	657	.009

Fuel oil is also used in our major stations for boiler startup and for setting boiler safety valves following boiler internal inspections and repairs. Any generation resulting from this fuel oil usage is negligible and is incidental to the purpose of using the fuel oil. The millions of BTU's consumed and the cost thereof of oil used in our major station during the years 1964 through 1967 were as follows:

BTU's Consumed

Year	Cost	BTU's (10^{-6})	% Total
1964	$ 76,259	119,959	.207
1965	52,863	77,903	.078
1966	52,262	75,863	.074
1967	37,285	52,727	.052

Fuel oil is seasonal to the extent that the greatest usage at the peaking plants is during the summer months and the greatest usage at the major stations is during other than summer months.

Nuclear - Illinois Power Company does not have facilities for generating electricity by utilizing nuclear energy.

Hydroelectric - Illinois Power Company has one small hydro-electric plant. The kilowatt hour output and the % of total from this plant for the years 1964 through 1967 were as follows:

Kwh Produced

Year	Kwh (10^{-6})	% Total
1964	18,593	.34
1965	16,638	.25
1966	16,599	.24
1967	16,475	.24

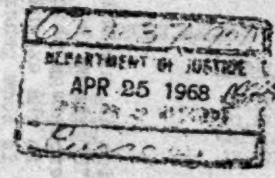
DAIRYLAND POWER COOPERATIVE
La Crosse, Wisconsin
54601

April 23, 1968 APR 29 1968

Mr. John T. Cusack
Attorney, Midwest Office
Antitrust Division
Department of Justice
Room 2634 United States Courthouse
Chicago, Illinois 60604



Dear Mr. Cusack:

In answer to your letter of April 9 concerning the acquisition of United Electric Coal Companies by General Dynamics Corporation, we have assembled as much information as is immediately available.

In answer to question 1, the coal shipped by Freeman Coal Company and United Electric Coal Company was delivered to our plants at Alma and Cassville, Wisconsin. Tabulation "A" on the attached sheet shows the tonnage and the dollar amounts to each station for the years 1964-1967. All of the United Electric Coal Company's shipments came from their Fidelity Mine. The Freeman Coal Company has the option of shipping similar coals from various mines and we do not have the information as to the mine from which the coal was shipped. The dollar amount shown in Table "A" of course includes freight.

In answer to question 2, we only supply electric power and therefore do not have a BTU output. The estimated kilowatt hour output from each station by coal supplied by the two coal companies in question are shown on Table "B". Also, shown in Table "B" is the percentage of this power to our total generation.

In answer to question 3, we have two generating stations utilizing oil and gas for generation. One of these is a dual fuel diesel station - the other is a diesel station using oil only as fuel. Table "C" shows the fuel costs, KWH output, and the percentage that the output of these two plants is to the total output. The purchases of oil and gas are as seasonal as we can possibly make them because of the unrealistic high price of gas and oil.

There is a 50 megawatt second round demonstration nuclear power plant on our system that was scheduled for operation in 1965. The nuclear reactor of this power plant is owned by AEC. The turbine generator of this plant is owned by Dairyland Power Cooperative, and has been ready for operation since 1965; however, the nuclear reactor is still not in operation. As to whether our utilization of the atomic energy is seasonal, it will be used when and if it is operable.

We have one hydroelectric plant which is our only other source of generating electric power. Table "D" shows the KWH generation of this hydroelectric plant and the percentage which this generation is to the total. This is seasonal to the extent that the river flow is seasonal. Although, there is some generation every day of the year.

At the present time, studies are just being initiated for determining our future energy sources.

We trust this information satisfactorily answers your questions.

Very truly yours,

DAIRYLAND POWER COOPERATIVE

John P. Madgett
General Manager

Pittsburg Midway	Allendale		2089	4.07
			1965	4.10
		Total	4054	
Republic	Flamingo		14761	4.07
			18406	4.10
	Sunspot		57396	4.47
		Total	90563	

1966 - Total 230801

United Electric	Cuba		58772 Tons @	$4.10
			172029	4.15
		Total	230801	

1967 - Total 233292

United Electric	Cuba	Total	233292	4.15

(2) No other energy fuel is used at the Pekin Plant.

(3) See number (2)

(4) Attached are copies of Franzen's letters of February 12, 13, and 23, 1968 which substantiate the use of coal as the most economical fuel that we can use. Gas during the year of 1967 would have cost $845,000 more than coal, less savings of $273,000.

Re United States v. General Dynamics Corporation, et al., Civil Action No. 67 C 1632 (N.D. Ill.)

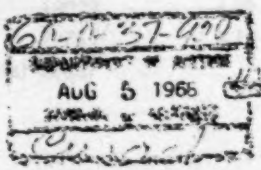
Gentlemen:

This letter is written in response to yours of July 29, 1968.

As stated in my letter of May 8, 1968, our East Chicago, Indiana, plant burns coal, coke and natural gas. The natural gas is purchased on an interruptible basis for economic reasons. On a firm or full-time basis the cost of the gas would approach the cost of purchased electrical energy and the primary use of the boilers in which these fuels are consumed is to generate electricity.

The only specification put on the coal presently being purchased for this plant is its B.t.u. content.

The plant, which was first put in service in 1951, was originally designed to burn coal. However, when economically priced gas became available in the Chicago area it was modified so that it can now burn either coal or gas. Coke is frequently available on a spot basis at attractive prices similar to the interruptible gas supply but the coke must be blended with coal or gas to burn efficiently so that it could not be used as a sole source of energy. Storage and handling costs of coal and coke are not significant and, of course, there are virtually no such costs related to gas.



Aside from the factors stated above and the fact that our contract with United Electric Coal Company calls for us to buy 50% of our fuel from them, cost is the sole factor in determining the fuel to use at any given point in time.

Very truly yours,

John R. Murphy

August 22, 1968

Mr. John T. Cusack
Attorney
Department of Justice
Room 2634 United States Courthouse
Chicago, Illinois 60604

Dear Mr. Cusack:

Responding to your letter of August 7, 1968, I shall try to answer the questions in the order in which they were asked.

1. Enclosed please find a schedule which provides the information regarding our coal purchases for the periods requested.

2. Neither the Dundee plant nor the Clarksville plant consumed any other energy fuel for the purposes for which coal is required. In both plants we use oil in connection with the start-up of kilns, because of the lower ignition point for oil. Once the coal is ignited, the fuel oil feed is stopped. The oil usage is not significant, and in no case has it been substituted as a running fuel, the purpose for which coal has been used by us.

3. Not applicable in light of the response to question 2.

4. I am advised that we do not specifically place a ceiling on the sulphur content of the coal we buy. However, we do seek to obtain the lowest sulphur content coal available at competitive prices. Economics play the most important role. If a high sulphur coal is offered at a substantially lower cost per million BTU than lower sulphur coal, we would use the high sulphur coal, provided the measures to compensate for the high sulphur content are not such as to erase the purchase cost advantage.

60-0-37-910
DEPARTMENT OF JUSTICE
AUG 28 1968
DIVISION V ILLINOIS
acknowledged 8-30-68

The present sulphur content of the coals purchased for the Dundee plant ranges from 0.80% to 1.25% with the average in the area of 1.10%.

The present sulphur content of the coals purchased for the Clarksville plant ranges from a low of 1.50% to a high of 3.0% with the average in the area of 2.6%.

We have not set an absolute maximum on sulphur content. I believe that this particular question has not been raised in a practical way in our experience, that is to say that extremely high sulphur coals have not been offered to us at a sufficiently low price to warrant our investigating the adjustments which we could or would be willing to make.

Obviously adjustment can be made and has been made within limits to the raw mix to compensate for changes in sulphur content of the coal.

5. General knowledge of the availability and economics of the various energy fuels known to be usable in the manufacture of cement clinker have made it unnecessary to make formalized surveys or studies as to the merits of one fuel versus another. Hence our information is fragmentary. At both Dundee and Clarksville only cursory investigations were made, and it was a relatively simple matter to decide to use coal at both locations for the main running fuel. The cost of fuel has been dramatically less for coal than for natural gas or fuel oil. However, from previous experience, our chief executive was reluctant to consider using a fuel whose supply could be interrupted.

Feasibility studies for the immediate conversion from coal to gas or oil have never been made at either location. It is possible to envision circumstances in which such would be considered, for example if another were to be in abundant supply for a reasonably assured long period.

We trust that this answers all of the questions which you raised.

Very truly yours,

Boyd W. Yard

Secretary-Treasurer

BWY:jr

FEDERAL POWER COMMISSION

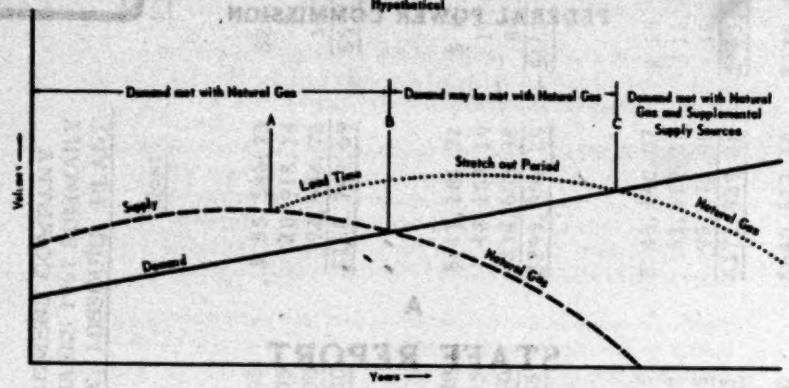
A STAFF REPORT ON NATIONAL GAS SUPPLY AND DEMAND

BUREAU OF NATURAL GAS
Washington, D.C.
September 1969

* * *

Figure 1

GAS SUPPLY – DEMAND BALANCE
Hypothetical



INTRODUCTION

Evidence is mounting that the supply of natural gas is diminishing to critical levels in relation to demand. There is a compelling need for accurate and current analysis and interpretation of this trend. Prior studies of future natural gas availability have proven to be overly optimistic. The purpose of this report is to provide a realistic and objective outlook on the natural gas supply-demand relationship as a guide to effective regulatory and management decisions.

On the basis of current trends, only a few years remain before demand will outrun supply. During this period decisions of increasing urgency will confront industry and government policy makers with respect to gas prices, market expansions, exports and imports, and substitute fuel technology and availability. Timely action can extend the usefulness of the natural gas resource base and ease the inevitable transition to a gas economy in which imported and substitute gas fuels will play an increasingly important role. Figure 1, a hypothetical gas supply-demand balance case, is illustrative of the timing problem and the value of purposeful planning for future gas supply. The dashed supply line represents a continuation of present trends. The dotted supply line represents a program which would optimize the usefulness of our remaining natural gas resources and provide the needed additional time for economic and technological developments to furnish the required volumes of substitute fuels at reasonable costs.

TOTAL COAL CONSUMPTION IN TONS IN 1967 BY STEAM ELECTRIC PLANTS IN THE EASTERN INTERIOR COAL PROVINCE SALES AREA AND THE TOTAL SALES OF COAL IN TONS IN 1967 FROM MINES LOCATED IN THE EASTERN INTERIOR COAL PROVINCE TO STEAM ELECTRIC PLANTS IN THE EASTERN INTERIOR COAL PROVINCE SALES AREA

States and Portions of States Comprising the Eastern Interior Coal Province Sales Area	1 Total Coal Consumption (In Tons)	2 Coal Sales From Mines Located Within the Eastern Interior Coal Province (In Tons)
Western one half of Kentucky	10,649,000	12,051,000
Western one-third to one half of the State of Tennessee	6,050,000	5,210,000
The Extreme Eastern Portion of the State of Missouri on or Near the Mississippi River	3,042,000	3,491,000
Eastern one half of Iowa	2,167,200	2,042,000
Southeastern Minnesota, defined as Principally the Cities of St. Paul and Minneapolis and the Southeastern one-quarter of the State Contiguous to the Mississippi River	2,298,000	2,092,242
Wisconsin, Except for that Portion Contiguous to Lake Superior and that Portion Contiguous to Lake Michigan above Milwaukee	5,689,000	5,699,000
Indiana	19,120,000	18,697,000
Illinois	28,295,000	28,324,000
TOTAL	77,310,200	77,606,242

1/ Production in excess of 300,000 tons.

2/ Pursuant to Final Judgment dated October 23, 1967 in United States v. Peabody Coal Company et al., Civil Action No. 67 C 1621 (N.D. Illinois), 1967 Trade Cases Sec. 72,213, Peabody is to divest itself on or before October 23, 1969 of mines having annual production of 6,000,000 tons of coal. In compliance with this judgment, Peabody is in the process of selling its Mecco, Allendale, and Elm (a combination of the Bright Star, Middle Grove, and Elmwood [not in production in 1967] mines) Mines, all of which are located in Illinois. In 1967 these mines produced a total of 2,495,297 tons of coal.

Sahara Coal Co., Inc. 7/	2,823,526	10	2.2
TOTAL of Leading Companies	118,303,399		91.4
TOTAL PRODUCTION in Illinois, Indiana and Western Kentucky	129,500,000		

See footnotes on page 2.

1/ Production in excess of 1,000,000 tons.

2/ 1967 Coal Report of Illinois shows 15,832 tons less for Peabody Coal Company.

3/ Pursuant to Final Judgment dated October 23, 1967 in United States v. Peabody Coal Company et al., Civil Action No. 67 C 1621 (N.D. Illinois), 1967 Trade Cases Sec. 72,213, Peabody is to divest itself on or before October 23, 1969 of mines having annual production of 6,000,000 tons of coal. In compliance with this judgment, Peabody is in the process of selling its Macco, Allendale, and Elm (a combination of the Bright Star, Middle Grove, and Elmwood [not in production in 1967] mines) Mines, all of which are located in Illinois. In 1967 these mines produced a total of 2,495,297 tons of coal.

This figure includes 1,436,358 tons sold by Squaw Creek Mine and 4,625,456 tons sold by Sinclair Mine during 1965 since production figures for these two mines were not available. The Squaw Creek Mine is operated pursuant to a joint venture between Peabody and Aluminum Company of America. The entire production of the mine is consumed by Alcoa and is not available for sale on the open market. Peabody receives 40 per cent of the operating profits from this mine.

4/ 1967 Coal Report of Illinois shows 193 tons more for The United Electric Coal Companies.

5/ 1967 Coal Report of Illinois shows 2 tons more for Truax-Traer Division of Consolidation Coal Co.

6/ 1967 Coal Report of Illinois shows 1 ton less for Zeigler Coal & Coke Co.

7/ 1967 Coal Report of Illinois shows 273,019 tons less for Sahara Coal Co., Inc.

CENTRAL ILLINOIS PUBLIC SERVICE COMPANY

GENERAL OFFICES 607 E. ADAMS ST.

SPRINGFIELD, ILLINOIS 62701

GOVERNMENT EXHIBIT 93

October 28, 1966

The Honorable Donald F. Turner
Assistant Attorney General
United States Department of Justice
Room 2634 United States Courthouse
Chicago, Illinois 60604

Dear Mr. Turner:

We have Mr. Bertram M. Long's letter of October 14, 1966 requesting certain information concerning the proposed acquisition of the stock of The United Electric Coal Companies by General Dynamics Corporation including coal purchases made by Central Illinois Public Service Company. The information requested is as follows:

1. The names of all coal suppliers for the years 1964 and 1965 are included on the attached tabulation.

2. Amount of coal in dollars and tons purchased is included in tabulation with 1.

3. Purchases of coal mined out-of-State by tons is included in tabulation with 1.

4. For many years it has been our practice to negotiate on an individual basis the terms of our coal purchases from our several coal suppliers. Several factors are considered in our coal purchasing decisions. Among these factors are: type of product (dust, screenings, carbon, etc.), BTU content, cost per million BTU (F.O.B. generating plant), sulfur and other impurities content, moisture content, amount of resulting ash, etc. Based upon the application of such factors, our coal purchases from Freeman Coal Mining Corporation and The United Electric Coal Companies have resulted in these two companies being among the principal suppliers of coal to two of our four electric generating stations (no coal is purchased from either company for use at our other two generating stations). In 1964 Freeman provided 24.8 percent and United Electric 2.9 percent of the total coal requirements at one of the generating stations, while at the other generating station the amounts were 12.3 percent and 23.8 percent, respectively. Similarly, in 1965,

DEPARTMENT OF JUSTICE
OCT 31 1966
DIVISION OF RECORDS

the relationships were 22.2 percent for Freeman and 3.0 percent for United Electric at the first station and 12.1 percent and 26.5 percent, respectively, for the second station. All factors considered, we have found the two companies to be competitive.

5. We do not know what effect, if any, there would be upon this company or other public utilities if General Dynamics Corporation were to be successful in acquiring all of the stock of The United Electric Coal Companies.

We trust that the above information is sufficiently complete for your purposes.

Yours very truly,

K. E. Bowen
Vice President

OCT 21 1966
ANSWERED BY LETTER
DATE 10-21-66

Dear Mr. Long:

(3) Both United Electric Coal Companies and Freeman Coal Mining Corporation have bid on supplying coal to our company. Other area coal suppliers also having bid for these requirements has satisfied us that the two named companies you have questioned have in fact held themselves out to be competitors.

I regret that due to my absence from the office for a few days that there has been a delay in responding to your letter.

Very truly yours,

Illinois Power Company

Attention: Mr. Donald F. Turner,
Assistant Attorney General

Dear Mr. Turner:

This is in reply to your letter of October 14, 1966, in which you ask a series of questions relative to our coal purchases:

1. The names of the firms which supplied us with coal during the years 1964 and 1965 are the Old Ben Coal Corporation, 10 South Riverside Plaza, Chicago; Republic Coal & Coke Co., 8 South Michigan Avenue, Chicago; Truax-Traer Coal Company, Division of Consolidation Coal Company, 524 Commercial National Bank Building, Peoria, Illinois; The United Electric Coal Companies, 307 North Michigan Avenue, Chicago; and Peabody Coal Company, 122 West Washington Avenue, Madison, Wisconsin.

2. The amount of coal in dollars and tonnage is as follows:

	Tons	Dollars
1964		
United	51,688	189,520
	212,095	$798,263
1965		
United	38,804	143,692
	217,715	$835,505

DEPARTMENT OF JUSTICE
OCT 24 1966
DIVISION OF RECORDS

3. During the years 1964 and 1965, the coal purchased from Republic was mined in Indiana. All other coal was mined in the state of Illinois.

4. Our present contracts with the abovementioned coal companies were entered into in 1961 for a period of five years. Our records do not show whether Freeman Coal entered a bid at that time. We are at present inviting bids from the abovementioned companies and others, including Freeman, for our future coal supplies. At the present time we have had no formal bid from either United or Freeman.

5. We do not feel that the elimination of United Electric as an independent coal supplier would in any way affect our operation.

I trust that I have answered these questions to your satisfaction.

Yours very truly,

L. S. Berry,
Vice President, Electric Oper.

STATE OF ILLINOIS

ILLINOIS COMMERCE COMMISSION

Commonwealth Edison Company
Application for authority to cause to be formed and to invest in a subsidiary corporation to conduct certain activities ancillary to its public utility business.

No.

PETITION

To the ILLINOIS COMMERCE COMMISSION:

COMMONWEALTH EDISON COMPANY (hereinafter called "Edison") respectfully says:

1. Edison is an Illinois corporation, with its principal office at One First National Plaza, Chicago, Illinois. It is engaged in the business of supplying electricity to the public in such city and in the northern part of the State of Illinois, and is a public utility subject to the jurisdiction of this Commission.

2. In the course of its electric public utility business, Edison purchases and installs large generating units, the usefulness of which and the cost of energy from which depend on the availability and price of fuel, principally coal and nuclear fuel. Edison is required to and does purchase large quantities of such fuels and is required to and does make forward commitments for the purchase of such fuels for supply to its generating stations.

3. Fossil fuel procurement has become increasingly difficult. The growth of nuclear power has had the effect of making coal mine operators reluctant to open new coal mines in and near Edison's service territory. Restrictions on the use of coal with sulfur contents characteristic of the major reserves in the areas in or near Edison's service territory have had a similar effect. In addition, large quantities of coal reserves in such areas are being acquired by petrochemical and other companies which have potential uses for such reserves other than their exploitation for fuels for electric generating stations.

4. While there is no similar short-run problem in the acquisition of yellowcake, which contains the natural uranium required as the raw material for nuclear fuel, the extent of uranium reserves is uncertain. Indeed, the Atomic Energy Commission has indicated that the reserves recoverable at $8.00 per pound of yellowcake (a price somewhat above the current market) are sufficient to satisfy the demands for such fuel only through about 1979. Edison has purchased sufficient yellowcake, for future delivery, to meet its nuclear fuel requirements through 1975, but now has under consideration the construction of additional nuclear units for which additional supplies of uranium must be arranged.

5. Edison was one of the first companies to enter the field of electric generation with nuclear power. Its Dresden Unit 1, which went into service in 1960, was the first large-scale entirely privately financed nuclear power plant. It has now operated successfully for ten years. Edison has also contracted for more nuclear capacity than any other investor-owned utility. Its 809,000 kilowatt Dresden Unit 2 is now in preparation for commercial operation, which is expected to begin before the summer of 1970. At that time, it will be the largest nuclear unit in commercial service in the United States. Dresden Unit 2 will be followed by Dresden Unit 3 and Quad-Cities Units 1 and 2, each with a capability of 809,000 kilowatts, and Zion Units 1 and 2, each with a capability of 1,100,000 kilowatts. Through extensive experience with the operation of Dresden 1 and its procurement activities for the subsequent units, Edison has developed specialized technological capabilities in the procurement and management of nuclear fuels.

6. A critical factor in the operation of nuclear plants is computer technology. Without highly developed computer skills, it is impossible to operate a nuclear plant; the utilization of such skills has an important effect on the efficiency of fuel management and, consequently, on the cost of power from nuclear

units. Edison's skills in the computer area are highly developed. It was the first utility in the United States to employ a large-scale electronic computer for its billing and for mass accounting operations, and has extended its computer applications to the solution of complex engineering problems in other areas of its business. By reason of its present extensive commitment to nuclear power, it has applied these skills to the problems of nuclear fuel management. A subsidiary to provide computer services both to Edison and to others, primarily utilities, would reinforce Edison's own capabilities and be of advantage to other utilities.

7. A large number of electric utility companies have committed to and over the next several years are expected to commit to the installation of nuclear power plants. In many cases, these companies will not have developed within their own staffs either sufficient skilled specialists or sufficient experience for the most effective management of nuclear enterprises or the application of computers thereto. Many of such companies will be installing their first nuclear units and, since nuclear units are economic only if very large, may operate only a single nuclear unit or a relatively small number for several years. Edison believes that by making available to such companies the advantages of its experience and background in nuclear fuel procurement, nuclear fuel technology and computer applications, it can benefit them while improving at the same time the security of its own fuel supply, its ability to purchase nuclear fuels advantageously, and the utilization of fuel in its own reactors.

8. Accordingly, Edison proposes to establish a subsidiary for the purposes, ancillary to its electric utility business, of:

(a) the acquisition and development of fuel reserves, both nuclear and fossil, capable of providing economical and reliable supplies of fuel for electric generation, the output

from such reserves to be made available to others when consistent with Edison's own requirements, and the conduct of such other fuel supply activities as may be reasonably related thereto;

(b) provision to itself and others of nuclear fuel management services and computer services.

Edison, therefore, requests the consent, authority and approval of this Commission to and for the formation of a subsidiary, all of the capital stock of which would be owned by Edison, and for the investment in such capital stock, without further order of the Commission, of up to $10,000,000.

9. In connection with the establishment of such subsidiary, Edison would propose to transfer thereto, at its cost, certain contractual rights to land with associated coal reserves, the nature and extent of which will be described in the testimony herein. These reserves, however, will not be developed until satisfactory means become available for limiting the sulfur by-products in the stack effluents produced by burning coal of the character contained in the reserves. Since no such means are now available, the subsidiary will initially simply hold and manage such land rights and land acquired for coal reserves without development for coal mining.

10. Also, in the initial stages of the organization and operation of the subsidiary, certain administrative, accounting and other services to the subsidiary will be provided by Edison at the cost to Edison of such services. Such costs to be incurred by Edison and reimbursed by the subsidiary will be limited to $100,000 until further application to the Commission for approval of the terms of any arrangements between Edison and the subsidiary.

11. Transactions other than those transactions above described between Edison and its affiliated interest, the proposed subsidiary, will be presented to the Commission for approval at such times and in the manner required by law.

12. Edison proposes to record its investment in the subsidiary and any profits or losses resulting therefrom in accordance with the Commission's Uniform System of Accounts for public utilities.

WHEREFORE, Edison requests consent, authority and approval of the Commission to form a subsidiary and invest therein as set forth in paragraph (8) above and to engage in transactions with such subsidiary as set forth in paragraphs (9) and (10) above.

Dated this 26th day of March, 1970.

STATE OF ILLINOIS }
COUNTY OF COOK } ss.

I, R. J. Scholtz, first being duly sworn upon oath, depose and say that I am a Vice-President of COMMONWEALTH EDISON COMPANY, an Illinois corporation; that I have read the above and foregoing petition by me subscribed and know the contents thereof; that said contents are true in substance and in fact, except as to those matters stated upon information and belief, and as to those, I believe the same to be true.

R. J. Scholtz

Subscribed and sworn to before me this 26th day of March, 1970.

THE UNITED ELECTRIC COAL COMPANIES

Special Meeting of the Board of Directors

October 9, 1959

• • • •

Mr. Morris commented briefly on sales prospects stating that he expects Commonwealth Edison to take additional 350,000 tons per year starting January 1, 1960, and at the same time Central Illinois Light expects to increase purchases by 150,000 tons per year, and Central Illinois Public Service by 100,000 tons per year, a total increase of 600,000 tons per year not including any sales to be made from Banner Mine which will go largely for lake delivery. More storage areas for natural gas are being found and gas companies will also restrict pumping from the well head in order to take advantage of domestic and commercial rates.

No further business appearing, on motion duly made by Mr. Morris, and duly seconded by Mr. Jessopp, the meeting was adjourned.

/s/ G. H. Utterback
Secretary

THE UNITED ELECTRIC COAL COMPANIES

DIRECTORS' MEETING

May 13, 1960

* * * *

The Chairman brought up for discussion the Company's ownership in McDonough and Schuyler Counties. At July 31, 1959 the Company owned or had contracts to purchase 2,529.10 acres of coal containing an estimated 8,976,117 tons and as of this date these figures have been increased to 3,339 acres of coal containing 11,530,000 tons. Inasmuch as the development of this field is probably some ten years in the future, it was decided not to pursue an aggressive purchasing policy in that area, but only to acquire acreage which might become available at not to exceed normal farm land prices in this area.

Table 1

Reported Uses of Coal Received by Consumers in Illinois
1944 and 1968
(Thousands of Tons)

Use	1944	1968	% Change
Electric utilities	10,242	28,221	+175.5
Coke and gas plants	4,198	3,069	— 26.9
Retail	14,595	3,312	— 77.3
Other[1]	12,941	8,863	— 31.5
Total	41,976	43,465	+ 3.5

[1] Includes general industrial, railroad, and miscellaneous uses.
Source: U. S. Bureau of Mines Coal Distribution Reports.

Q. Will you comment on coal production in Illinois?

A. Illinois in 1969 produced 64,832,584 tons of coal, or about 12 percent of the national total. Exhibit 3a is a map showing the area of Illinois underlain by coal-bearing rocks and locations of mines that were active in December 1969. Exhibit 4a indicates annual coal production in Illinois since 1948, and the steady increase in production during the past 10 years. The 1969 production of coal in Illinois was the largest annual production since 1948, according to data reported by the Illinois Department of Mines and Minerals.

Exhibits 4a, 5a, 6a, 7a, 8a, and 9a present statistical data on Illinois coal and certain relationships to national statistics.

* * * *

Q. Is any part of the Illinois coal with relatively low-sulfur content used for generating electric energy?

A. Yes, although I do not have data on quantity and quality of coal shipments from the mines to specific markets. From the principal low-sulfur coal areas, premium coal for blending for use in metallurgical coke production is now produced at an annual rate of about 4 million tons per year. This coal is prepared from naturally occurring low-sulfur coal, and if some of the coal produced does not meet standards for metallurgical coke production, primarily because of higher ash and sulfur content, it is sold in other markets. This less-than-premium-quality coal is, of course, still relatively low in sulfur content compared with most Illinois coal produced.

A steadily increasing use of Illinois coal in blends to produce metallurgical coke in recent years is one of the reasons for the extensive development of mining activity in the low-sulfur coal area in Franklin and Jefferson Counties, and, on a more modest scale, for some expansion of activity in the relatively low-sulfur coal area in Saline County.

Q. Are there techniques of coal desulfurization other than washing?

A. Yes. The coal can be converted to other fuels with by-product recovery of sulfur. Of greatest long-term interest is the possibility of producing liquid and gaseous fuels from coal. Development of technology to accomplish this conversion is well advanced and pilot-scale plants are now in operation, although no commercial plants have been announced.

A report by H. E. Risser, entitled "Gasification and Liquefaction—Their Potential Impact on Various Aspects of the Coal Industry," was published by the Illinois State Geological Survey as Circular 430

(1968) and is presented as Exhibit 21a. Pertinent information on future projections for coal are present in Exhibit 22a, a report published by the Illinois State Geological Survey as Circular 310 and entitled "Coal in the Future Energy Market," by H. E. Risser (1960).

If you are generating electricity, or doing any industrial power or heating job with coal, use a product of the Freeman mines in Illinois . . . for quality and consistently excellent performance. Available reserves aggregate one billion tons. You can be sure of dependable service and security of supply today and for many years to come.

Deep Mined Coals from No. 6 Seam in Southern and Central Illinois

distinguished for their basic character and excellent preparation for electric utility, industrial, metallurgical and heating uses

CROWN COAL / ORIENT COAL

ORIENT NO. 3 JEFFERSON COUNTY, SOUTHERN ILLINOIS

Shipping point Orient Mine No. 3, Illinois. Daily capacity 14,000 tons. One of the largest mines in the country. Famed for quality and excellence of preparation. The lowest ash low sulphur coal in Illinois for metallurgical, electric utility, industrial and heating applications. Extensive reserves.

ORIENT NO. 4 WILLIAMSON COUNTY, SOUTHERN ILLINOIS

Shipping point Orient Mine No. 4, Illinois. Daily capacity 7,000 tons. A special feature of this mine is its attractive glossy-black, firm structure coal, unusually low in moisture and high in Btu content. A popular dealer coal as well as a long-time favorite with utilities and industries.

ORIENT NO. 5 FRANKLIN COUNTY, SOUTHERN ILLINOIS

Shipping point West Frankfort, Illinois. Daily capacity 7,000 tons. Freeman's newest mine, highly automated for unusually precise control of both quality and sizing. Orient No. 5 coal is a low moisture, high Btu product, highly desirable for utility, industrial and heating uses.

CROWN MINE MONTGOMERY COUNTY, CENTRAL ILLINOIS

Shipping point Crown, Illinois. Daily capacity 10,000 tons. The largest air-cleaning plant in the country plus unusually versatile preparation facilities capable of meeting varied market requirements. Crown coal is widely used by utilities and industries, and also has a large and loyal dealer following.

Distributors of Choice High and Low Volatile Coals from Eastern Kentucky and West Virginia

GOVERNMENT EXHIBIT 232

THE ENERGY OUTLOOK

Although U.S. energy consumption patterns have remained virtually unchanged since World War II, two factors—increased competition among conventional fuels and greater public concern over the environment—have created doubts about the indefinite continuation of established trends

Abraham Gerber, Bruce C. Netschert

National Economic Research Associates, Inc.

In addition to reporting on prevailing trends in U.S. energy production and consumption, this article makes a number of statements concerning the outlook for the future. For example, the growth of underground distribution and control over the sulfur content of fuels and stack emissions may possibly halt or reverse the long-term downtrend in the cost of electricity. Although nuclear power is beginning to emerge as a competitor of fossil fuels, it is still too early to predict its eventual impact on the overall picture.

Developments in energy consumption in the United States during the 1960s have continued the trends established in the period since World War II. At the same time, however, new uncertainties have arisen that shed doubt on the further continuation of established trends for many of the individual energy commodities. The first of these uncertainties is the intensified competition among the conventional fuels and between the fuels and electricity, arising from a growing intersubstitutability among all forms of energy. The long-distance pipeline, which in previous years primarily affected competition in space heating and industrial use by making natural gas available throughout the U.S., is now bringing gas into direct competition with electricity through on-site generation of power from gas and the use of the waste heat for all heating-

I. U.S. energy consumption by consuming sector, 1961-1966, 10^{12} kilogram calories

Year	Household and Commercial	Industrial	Transportation	Electricity Generation	Miscellaneous and Unaccounted For	Total Gross Economy Input
1961	2625	3753	2769	2138	199	11,484
1962	2771	3890	2877	2282	180	12,000
1963	2787	4089	3015	2435	186	12,512
1964	2810	4281	3089	2610	192	12,982
1965	2972	4414	3206	2800	164	13,555
1966	3154	4515	3326	3040	134	14,168
Average annual rate of increase:	3.7%	3.8%	3.7%	7.3%	—	4.3%

Source: U.S. Department of the Interior, Bureau of Mines, *Minerals Yearbook.*

cooling needs. Simultaneously, the continuation of long-established trends of declining electricity costs and rising incomes has stimulated the invasion of electricity into a spaceheating market. Moreover, the long-heralded threat of nuclear power to the position of the conventional fuels, especially coal, has finally become a reality in the power fuel market.

The second uncertainty arose through the recent rapid development of public concern over environmental degradation, especially air pollution. This concern has taken the form of restrictions on the sulfur content of fuels and stack gases, and of governmental interest in the possibility of the electric automobile as a substitute for the conventional gasoline-powered vehicle. Although the effect of this development has thus far weighed most heavily on coal and oil, it is still too early to foresee the ultimate course of events.

II. U.S. consumption of crude petroleum, natural gas, and electric energy, 1961-1966

	Crude Petroleum, 10^3 tonnes	Natural Gas, 10^6 cubic meters	Electric Energy,* 10^6 kWh
1961	399,792	368,423	808,200
1962	410,651	391,190	868,917
1963	424,004	412,323	926,757
1964	431,086	437,554	994,360
1965	441,376	454,012	1,059,444
1966	460,904	486,818	1,146,693
Average annual rate of increase:	2.9%	5.7%	7.2%

147

Another important area of interest has to do with the thermal pollution effects of cooling-water discharge from large power plants, especially nuclear plants, in local bodies of water. Growing concern over the thermal effects on stream ecology is beginning to play an increasingly important part in the location, design, and cost of power plant construction.

Another environmental factor that is also affecting electric power is the growing public opposition to the construction of overhead distribution and transmission lines on the grounds that they mar the esthetic beauty of the landscape. This has caused costly delays and re-routing of transmission lines. In distribution, where the technology is presently available, lines are increasingly being located underground, usually at a somewhat higher cost.

Recent and future growth rates

Total energy consumption in the United States grew at an average rate of 4.3 percent per year in the period 1961-1966 (see Table I and Fig. 1). Energy consumption for uses other than electricity generation grew at a rate of 3.6 percent. The rate of growth in the consumption of fuels for electricity generation was 7.3 percent, which was equivalent to the growth in electricity consumption itself (see Table II). Thus the use of fuels in power generation lifted the growth rate for total fuel use above that of direct fuel use alone. The growth in fuel consumption for electricity generation was little affected by the moderate improvement in average thermal efficiency at central stations from 31.7 to 32.6 percent, or an average increase of 0.19 percentage point over the period 1960-1965. (The 1966 figure was not available at the time of writing.)

In the latest five-year period the improvement in the average heat rate has slowed down considerably as compared with the overall trend since the end of World War II (an average increase of approximately 0.55 of a percentage point per year). There has been very little improvement in the best units during this period, and thermal efficiency in conventional fossil-fueled plants there-

fore appears to be nearing a plateau in the neighborhood of 40 percent. This slowing down in the rate of improvement in average thermal efficiency is likely to continue over the next ten years or so.

In the absence of the successful development of a new technology, such as magnetohydrodynamics, or the development of new materials that would make possible still further increases in temperatures and pressures employed, additional improvements in thermal efficiency are likely to be relatively minor in nature. The average, therefore, can be expected to decline only slowly as new fossil-fueled generating plants at today's highest thermal efficiencies are added to the existing plant population. Consequently, the growth in fuel requirements for electricity generation purposes will tend to grow in direct proportion to the growth in conventional fossil-fuel power generation. (Of course, it is anticipated that nuclear power plants will continue to operate at much lower thermal efficiencies than will the conventional power plants.)

The growth rates in energy consumption and electricity consumption shown in Tables I and II compare with an average growth of 5.6 percent per year in Gross National Product (measured in constant dollars) over the same period. Since total energy use grew at a slower rate than GNP and electricity use grew at a faster rate, the trends in energy-GNP relationships established in the years since World War II have continued: The total energy consumption per dollar of GNP continues to decline, whereas the consumption of electricity per dollar of GNP continues to increase.

These trends are the result of two fundamental economic features of long duration in the United States economy. One feature is the continuing shift in the structure of the economy, in which the governmental and service industry sectors are becoming ever-larger portions of total GNP. In 1966 these two sectors, which are not energy-intensive, accounted for almost one half the total. As a result, energy consumption per dollar of GNP has continued to decline. The other feature is the high income elasticity of the economy in relation to consump-

III. U.S. energy consumption by energy source, 1961-1966

Year	Anthracite	Bituminous Coal and Lignite	Natural Gas, Dry	Petroleum and Natural Gas Liquids	Electricity		Total
					Hydro-power	Nuclear Power	
1961	0.9%	21.5%	29.0%	44.9%	3.6%	0.1%	100.0%

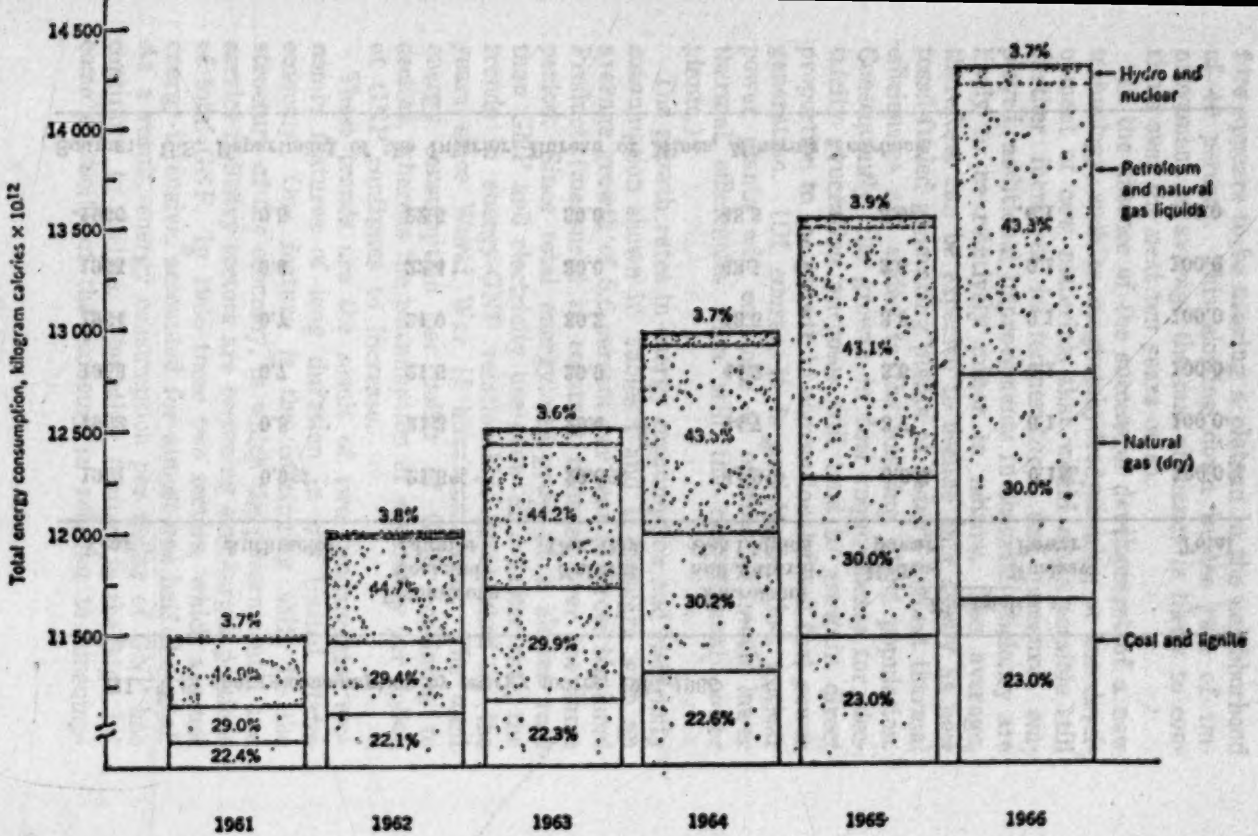

FIGURE 2. Energy consumption in the United States by energy source.

tion of energy in secondary and tertiary forms. As incomes rise there is a tendency to consume energy in a more processed or refined form of higher value. Therefore, as the United States energy economy has become less energy-intensive it has at the same time become more electricity-intensive.

There is nothing on the horizon at the present time to indicate any change in these general relationships. In its latest energy forecast, the U.S. Bureau of Mines expects the annual growth rate in the consumption of each of the fossil fuels to average 3.1 percent through 1980. Overall energy consumption is forecast to grow at a 3.3 percent rate and electricity consumption (excluding self-generated industrial electricity) at 6.5 percent. Thus growth in electricity is projected to be at roughly double the rate of growth in the fuels. GNP growth is assumed to be 3.9 percent.[1] All of these rates are lower than the experience of the 1960-1965 period; however, their relative positions remain essentially unchanged.

As shown in Table III and Fig. 2, the composition of the energy input pattern has changed very slightly in the past five years. It is significant, however, that coal shows a small but definite uptrend, and petroleum, conversely, a downtrend as a proportion of the total. Given the continuing more rapid growth in electricity production than in total energy consumption, these trends should continue. It is evident that the growth of coal would be greater were it not for the development of nuclear power.

Whether or not the competition of nuclear fuel with coal will be sufficient to hold the growth rate in coal at the same level as that of the other fossil fuels, as the Bureau of Mines projects, is a question that must remain unanswered at present, since the answer depends on the experience with the new generation of nuclear plants now being constructed.

Although nuclear plants in the past two years have constituted roughly half of the capacity ordered by the U.S. power industry, there has been almost no operating experience with the large-size units that have been or-

dered. To date, experience has been confined to 200-MW units at Yankee Atomic and Dresden I and the 400-MW San Onofre unit, which began operation in the summer of 1967. The operating performance of the 600-,800-, and 1100-MW units now under construction, which represent major extrapolations of the size of presently operating units, remains to be determined. In any event, the large nuclear share of capacity on order may be a misleading indicator of the inroads of nuclear power and may not accurately reflect its present competitive position.

Inasmuch as the acceleration of nuclear orders has exerted severe pressures on the limited manufacturing capacity, the construction lead times have stretched out considerably. Nuclear orders on the books now include some capacity for installation with an eight-year lead time. In contrast, units for fossil-fueled capacity continue to be ordered some three to four years prior to the expected operating date. If the nuclear portion of capacity were to be measured on the basis of capacity to be installed as of a given date rather than on the basis of capacity on order, it would be lower. For example, since manufacturing capacity for 1973 deliveries is already fully booked, all additional orders for thermal generating capacity to be installed by 1973 will have to be for fossil-fueled units.

Moreover, the size extrapolations could result in technical difficulties, with consequent delays in bringing these plants into operation. This raises the possibility of "brownouts" or even "blackouts" in the early 1970s. Already the record of delays in nuclear plant construction to date has caused some concern in the industry and may lead to the ordering of additional fossil-fueled capacity for installation at that time in order to protect against the possibility of such delays in bringing the nuclear plants on line. Thus, although the long-term outlook—say, two decades and beyond—may favor nuclear development, for the shorter term the fossil fuels (especially coal) remain very much in competition, with the share to be won by each still to be determined by its competitive vigor.

Coal remains the most important fossil fuel for electricity generation in the United States. In 1966 it still fueled 65 percent of the thermal generation and 54 percent of total generation. Although total coal reserves of all types are estimated by the U.S. Bureau of Mines to be about 1.5 X 10^{12} tonnes, the availability of reserves suitably located in sufficient quantity may prove to be a problem in maintaining coal's relative position in electric generation. The size of electric generating units and plants is increasing and the size of units capable of competing economically with nuclear power is likely to be in the 800-MW range and larger, with plant sizes of 2500 to 3000 MW visualized. (Along with the move to these larger sizes there appears to be developing the first glimmerings of a trend of great potential significance—the procurement of generating equipment from foreign manufacturers by the investor-owned utilities in the United States. During 1967 several large utilities announced such purchases, which previously had been made almost entirely by publicly owned systems.) A 2500- to 3000-MW plant would require 5.9 to 6.3 X 10^{6} tonnes of coal per year, or a total of about 180 X 10^{6} tonnes for each plant during its lifetime. If coal is to be supplied to these plants economically through the exploitation of the economies of scale in mining and transportation, it will have to come from no more than two or three large blocks of reserves, strategically located with respect to the generating plants.

In the absence of such economies of scale an annual requirement of such large tonnages would be difficult to provide at price levels competitive with nuclear power. Thus, with few exceptions, supply of small tonnages from a large number of mines is economically impracticable; nor can long transportation distances and high costs be tolerated. Some 71 percent of the coal reserves of the United States lie west of the Mississippi River, yet because of the transportation costs, these reserves cannot be considered for use in the area east of the Mississippi River, where the largest markets for power plant consumption are located. It will be difficult, therefore, to put together the large blocks of reserves needed for a

large-scale mining operation capable of providing economically the 6 to 6.5 X 10^9 tonnes a year that would be required for a 3000-MW power plant. If this is not possible, coal will face the erosion of its markets by nuclear power.

The outlook for oil raises different problems. A report issued by the United States Department of the Interior in 1965 [2] estimated that total consumption of liquid hydrocarbons (crude oil, lease condensate, and natural gas liquids) in the United States in 1980 would be at a level 26.7 percent greater than the consumption subsequently recorded in 1966. Since the petroleum industry, unlike the coal industry, must discover new reserves if such an increase is to be attained (or, indeed, even if present levels are merely to be sustained), the question naturally arises as to whether the requisite discoveries are likely to be made.

There is at present considerable controversy over this question. Although it is generally agreed that the required petroleum resources exist,* the industry contends that exploration for new reserves will be inadequate unless the price of crude oil rises. The situation is complicated by the already high cost of U.S. crude oil relative to oil produced elsewhere in the world. Under the Mandatory Oil Import Control Program instituted in 1959, imports of oil and oil products into the United States are subject to quota limitations and it is the stated policy of the U.S. Government that any significant increase in the price of domestic crude oil would occasion a review of the program.

(The quantity of oil and products imported in 1967 equaled approximately 21 percent of total domestic consumption. Under the quota system, imports other than residual oil are limited, on the East Coast, to 12.2 percent of consumption. In an attempt to stimulate the use of low-sulfur residual oil, the restrictions on its importation were greatly relaxed during 1967. Imports of

---

* The U.S. Geological Survey has estimated that approximately 200 X 10^9 tonnes of liquid hydrocarbons exist in nature within the borders of the United States and on the adjacent continental shelf. Of this amount, 133 X 10^9 tonnes remain to be discovered.[3]

crude oil and petroleum products excluding residual oil averaged 18.6 percent in the period from 1961 to 1966. Residual oil is excluded from this comparison since it is not produced in response to domestic demand; hence, imports of it do not affect the demand for crude oil.)

The industry also points to the sharp drop in the number of wells drilled that has already occurred in the past several years as evidence of the fact that a price rise for crude oil is not only needed for the future but is already overdue. It has not been demonstrated, however, that this lower drilling activity is related to the price of crude oil rather than to such other causes as the level of demand, more prolific exploratory targets elsewhere in the world, the development of reserves through improved recovery techniques (see below), or the decision of individual companies to divert some funds temporarily to other uses.

The outlook for natural gas and the opinions concerning it are in many ways similar. An industry-sponsored committee has estimated that U.S. requirements for natural gas through 1990 will be as follows[4]:

Year	Cubic Meters X 10^{12}
1975	0.722
1980	0.810
1985	0.906
1990	1.019

Another industry-sponsored committee[5] has estimated that the potential supply of natural gas as of the end of 1966 was 19.539 x 10^{12} cubic meters, excluding proved reserves.* This is approximately equal to the projected

* The definition and coverage[5] of the Potential Gas Committee's figure is wholly different from that of the U.S. Geological Survey's estimate of crude oil referred to previously. The Committee defines potential supply as "that prospective quantity of natural gas yet to be found and proved by test wells which can be expected to be drilled in the future under assumed conditions of adequate but reasonable prices and with normal improvements in technology . . . ." The Geological Survey figure, in contrast, refers to

cumulative requirements through 1990, but with the addition of present proved reserves the total supply becomes 27.72×10^{12} cubic meters. According to the estimates of the two committees, therefore, sufficient gas exists in nature to take care of U.S. consumption requirements through 1990, although serious supply deficiencies should begin to become apparent about that time. On the other hand, if the U.S. Geological Survey is correct, sufficient gas reserves exist to satisfy needs still further in the future, provided technology is equal to the task.

Nevertheless, as is true with respect to petroleum, there is controversy over whether sufficient discoveries will, in fact, be made, whatever the natural resource stock may be. Here, too, the industry argues—primarily in its presentation to the Federal Power Commission, which regulates natural gas † prices—that higher gas prices will be needed and, indeed, are already overdue. Again, well-drilling activity has declined in recent years. Although the Federal Power Commission has heard the industry arguments, it has not found them persuasive enough to take action.

Recovery efficiency and low-grade-resource use

The ability of the petroleum industry of the United States to maintain an increase in production in each of the past nine years (averaging 2.75 percent per year) has been increasingly the result of improvements in recovery efficiency. The most important contribution on this score has been secondary recovery, through the injection of water, natural gas, and other fluids and, to

---

the quantity existing in nature, with no qualifications as to economic or technologic feasibility. The Geological Survey estimate for natural gas on the same basis is approximately 104.6×10^{12} cubic meters remaining in nature, of which 95.6×10^{12} cubic meters remain to be discovered.

† The Commission has regulatory powers only over gas produced in one state and sold for consumption in another. Gas produced and sold for consumption within the same state is unregulated; in recent years such gas has amounted to 40-45 percent of the total gas consumed.

some extent, through "thermal recovery," involving the injection of steam or the burning of a small fraction of the oil in place.

Between 1959 and 1965 secondary oil production as a percentage of total oil production (including lease condensate) increased from 22.0 to 32.4 percent. The U.S. Bureau of Mines projects a continuation of this increase at an annual rate of 0.5 percentage point, so that in 1980 secondary production is expected to account for 41 percent of total production. The recovery efficiency, currently estimated to be a little over 30 percent, is expected to reach 40 percent by 1987.*

Recovery efficiency is also rising in coal mining. Although there are no direct data on the change, it can be inferred by changes in the proportion of coal produced by different methods. Surface mining, in which recovery may reach as high as 90 percent, continued its growth as a percentage of total coal mining in the period 1961-1966, rising from 30.3 to 33.7 percent. Auger mining, in which recovery is also greater, on the average, than in underground mining, rose from 2.0 to 2.9 percent in the same period. In addition, the progressive exhaustion of the coal seams, best-suited to the conventional room and pillar method of underground mining, has led to a small but growing application of longwall mining, with a consequent increase in recovery. In 1961 production by this method was only 24,000 tonnes. In 1966 it was over 2 million tonnes, 86 times greater.

There has also been improvement in the utilization of coal seams previously uneconomic to mine. The combination of surface and auger mining, for example, has had this effect, as has the increase in the depth to which surface mining methods can be extended. A new stripping machine, the largest yet built, can uncover economically coal seams 56.4 meters underground. Similar improvements have occurred in the ability to mine thinner seams: Continuous mining machines are now available for working seams only 6 meters thick.

The application of controlled nuclear explosions holds the promise of utilization of other hydrocarbon resources previously uneconomic to exploit. The first step in this

direction was the experimental detonation of a 26-kilotonne thermonuclear device at a depth of 1293 meters in the Pictured Cliffs formation in northwest New Mexico on December 10, 1967. The rock in which the explosion took place is known to contain natural gas, but its permeability is so low that production with conventional means is uneconomic. The purpose of the test was to see whether the results of the explosion will permit commercial recovery of the gas. It has been estimated that if the method of "nuclear fracturing" proves technically and economically feasible, its application throughout the western United States will create reserves of natural gas that are roughly double the present level.

Two other nuclear explosions in the planning stage involve the use of a 40-kilotonne and two 50-kilotonne devices in low-permeability gas formations in western Colorado. Still another project that will probably be carried through if the first test proves successful is a proposal to use underground nuclear explosions to recover oil from the oil shales of the Green River formation in Colorado, Wyoming, and Utah. Although shale oil recovery is already technically feasible through conventional methods of mining, crushing, and retorting the rock, continuing efforts over the past four or five decades have been unsuccessful in bringing down the cost of the product to a level competitive with crude oil. Success with nuclear explosions and drilling to produce the shale oil directly would make available a resource estimated to total several times the present world reserves of crude oil.

Uranium reserves in the U.S. at the present time are an uncertain quantity. The latest estimate of the U.S. Atomic Energy Commission is 181,000 tonnes of U_3O_8 in proved reserves available at a price of up to $22 per kilogram. This follows, however, a period of about a decade in which active exploration has been discouraged. The growth in nuclear orders in the past two years has stimulated an active exploration effort by the uranium mining industry, the results of which should become known over the next two to three years. It is reasonable to expect that the increased knowledge of uranium geol-

ogy gained in the past decade and the more systematic approach to uranium exploration compared with that carried out in the early 1950s will result in expanding known uranium reserves. In addition, improved recovery technology should make available reserves that at the present time are uneconomic.

Problems in the future production and utilization of energy

One of the outstanding phenomena in public attitudes and governmental policy in the United States during the past several years has been the rapid rise to prominence of concern with the environment. One of the most important subjects of this concern is air pollution, especially pollution by sulfur dioxide. Recent federal and local regulation and standards have imposed severe limitations in certain metropolitan areas on the allowable sulfur content of fuels under a series of progressive reductions applicable over the next few years. There is currently developing a trend toward the imposition of regulations prohibiting the use of fuel with more than 1 percent sulfur by weight in the metropolitan centers of the United States. At the same time, the technological justification of such a stringent standard is being increasingly questioned.

Although the new standards are being met in New York City, the first area for which they were adopted, it is as yet not at all clear how they can be met on a national scale. (Strictly speaking, Los Angeles was the first metropolitan area to set limitations on fuel use, but the emphasis was on the local smog problem rather than on sulfur dioxide as such.) The East Coast, which accounts for 66 percent of total national consumption of residual oil imports 84 percent of its needs. The Venezuelan product, which constitutes the bulk of the imports, is high in sulfur content. To date, the low-sulfur needs are being met by imports from other countries, but the supply of such oil, especially in the face of the growing concern over air pollution in other parts of the world, does not appear at this time to be adequate. One solu-

tion is to desulfurize high-sulfur oil, but there is a reluctance to commit the required large capital sums as long as it is not clear which of the many possible processes is the best. In any event, it is already evident that the use of low-sulfur oil will entail higher costs. For the initial conversion in the New York City area the increase is about one third.

There is also a problem with respect to coal. If coal used in power generation is limited to coal with 1 percent or less sulfur content, as seems likely, the usable U.S. coal reserves would be drastically reduced, since no economically satisfactory method for coal desulfurization as yet exists. Again, it is clear that the use of low-sulfur coal will entail higher costs regardless of the solution that is adopted.

One alternative that appears to provide at least an interim solution is the use of high stacks on power plants. The regulatory authorities in the United States are not yet convinced that high stacks capable of dissipating power-plant effluent into the atmosphere constitute a satisfactory solution. However, increasingly favorable experience with high stacks may improve their acceptability as a solution, at least temporarily.

An alternative that may solve the air-pollution problem for both coal and oil, at least for power stations, is the desulfurization of stack gases. But this, too, would certainly bring higher costs unless desulfurization technology were to permit the revenues from the recovered sulfur to exceed the cost of recovery. Further, it would require a change in the regulations pertaining to the sulfur content of fuels, for which the authorities have shown no enthusiasm to date; and there would remain the matter of high-sulfur fuel use by other consumers, for which stack gas desulfurization would not be applicable.

Another aspect of concern over the environment that has a bearing on the future production of coal is the tendency to impose more stringent regulation on strip mining, the most economic means for obtaining coal at the present time. The increasingly severe requirements for land restoration will tend to limit the extent to which

strip-mining technology can be exploited and, in any event, will tend to exert upward pressure on coal costs and prices.

Two other areas of concern with the environment are wholly power-industry problems. One is the matter of "thermal pollution." As station size passes the 1000-MW mark and as population growth and increasing urbanization make large station sites ever more difficult to find, the effect of such stations on the temperature of local bodies of water used for cooling purposes is becoming an important issue. It is no coincidence that cooling towers are beginning to appear in the United States, from which they have been absent heretofore. The first towers were built for plants located on small streams, but one is now under construction for a plant on the Ohio River, one of the largest streams in the country.

The problem of thermal pollution is especially severe for nuclear plants, which are, as yet, considerably less efficient than fossil-fueled plants. A nuclear plant converts about 25 percent less of the heat output into electric energy and, for an equal number of kilowatthours, discharges about 50 percent more heat into the cooling water than does a fossil-fueled plant. This has already created some difficulties in obtaining construction permits for nuclear plants, and in one instance has necessitated the use of cooling towers.

The second area is the effect of transmission and distribution lines on the appearance of the environment. Local authorities are putting increasing pressure on the power industry to install new distribution lines underground and in some instances to convert existing overhead lines to underground. There is pressure as well from both local and state authorities to put transmission lines underground and there is increasing difficulty in obtaining rights of way for the overhead lines.

The matter of underground distribution is not a severe technical problem for the power industry, but underground transmission is. Here public pressure is mounting, even though the technology does not yet exist. Nevertheless, under the circumstances, the necessary technology can be expected to develop, even though no one

can foresee its nature at this time. Meanwhile, the use of higher voltages (up to 765kV) is being adopted in order to provide a greater total capacity over a given right of way.

The significance of all these pressures on the power industry as a result of concern with the environment is that they threaten to halt or even reverse the previous continuous progress in reducing costs. Action to comply with each of the foregoing public desires will probably bring with it increased costs. Initially, as is true of low-sulfur fuel, the increase can be substantial. In the light of the present state of knowledge the installation of underground transmission will likely dwarf the other increases. It is probable that as technology catches up on each of these fronts the additional cost may be lessened, but there are no grounds, at least at present, for expecting or even hoping that the net result a decade or two from now will be lower delivered power costs than at present. For the power industry this prospect is especially ominous, as it comes at the very time when it faces greater competition from the fuels in a growing range of applications.

Although the total energy resources remain abundant, the energy markets in the United States are now subject to severe turbulence, as competition among all the energy sources to maintain or increase their market share continues to grow in intensity. The result, for the next decade at least, is likely to be continued availability of adequate total energy supply at close to present real cost.

Summary

Prevailing trends in energy consumption in the United States established in earlier years continued in the period from 1961 to 1966 and are likely to continue for the indefinite future. Developments during the period, however, suggest that trends in the level of consumption of the various individual sources and forms of energy are likely to change in the coming decade or two. Nuclear power began to emerge as a full-fledged competitor of the fossil fuels in power generation, but it is not yet pos-

sible to assess its likely impact on the consumption of fossil fuels in the next two decades. Similarly, the impact of measures to abate air pollution on energy consumption patterns in the near-term future cannot yet be foreseen. It is possible that control over the sulfur content of fuels and stack emissions, together with the movement to install power distribution facilities underground and limitations on the allowable thermal effect of central station condenser cooling on bodies of water, may halt or reverse the long-term downtrend in the cost of electricity.

Improvements continued in the efficiency of recovery of both petroleum and coal. The underground explosion of a nuclear bomb in 1967, conducted as an experiment to increase the recovery of natural gas in rock from which commercial production is now impossible, offered the promise of creating large additional natural-gas reserves in this manner and of making possible the commercial use of oil shale resources as well. Whether or not such efforts succeed, the outlook in the United States is for continued availability, for at least the next decade, of adequate supplies of energy in its various sources and forms without any appreciable increase in cost other than inflation.

Abraham Gerber received the B.A. degree from Columbia College in 1948 and the master's degree from Columbia University in 1950, after which he attended the New School for Social Research for a year on a graduate scholarship. In 1951 he joined the Department of Commerce's Office of Business Economics and shortly thereafter transferred to the Bureau of Mines, Department of the Interior. In 1953 he joined the American Electric Power Service Corporation, where he was later named administrative assistant to the president of the AEP Company. In 1961 he was appointed secretary of the System Development Committee, established for exploring new areas in the technical and economic development of the AEP system in all phases of its activities.

Mr. Gerber served as consultant to President Eisenhower's Cabinet Committee on Energy in 1953, as secretary of the Subcommittee on Energy and Raw Materials Resources of the EJC Engineering Research Committee in 1961-1962, as a member of the Technical Advisory Committee of the Office of Coal Research from 1961 to the present, as a member of the Fuels Special Technical Advisory Committee of the Federal Power Commission National Power Survey from 1962 to 1964. At present he is serving as senior consultant to National Economic Research Associates, Inc.

Bruce C. Netschert received the B.A. degree in geology in 1941 and the Ph.D. degree in economics in 1949, both from Cornell University. He joined the University of Minnesota, Duluth, as assistant professor in 1949, and in 1951 became a commodity-industry analyst for the U.S. Bureau of Mines. Later, as a staff member of the President's Materials Policy Commission, he prepared supply forecasts to 1975 for copper, lead, zinc, tin, and rubber. From 1953 to 1954 he was a consultant in the materials area for the National Security Resources Board and its

successor agency, the Office of Defense Mobilization. In 1954 he joined the Central Intelligence Agency, where he was branch chief responsible for nonferrous metals and nonmetallic minerals. As senior research associate for Resources for the Future, Inc., from 1955 to 1961 he conducted research on the future supply of fuels and energy sources, including nuclear and solar energy, and the future supply of the major metals. Since 1961 he has served as director of the Washington office of National Economic Research Associates, Inc., where he conducts and supervises research on a wide variety of subjects, with emphasis on fuels and energy resources. He is a member of Phi Beta Kappa, AIME and the American Economic Association and a fellow of the Geological Society of America.

WESTERN SOCIETY OF ENGINEERS

and

AMERICAN NUCLEAR SOCIETY

THE FUTURE ROLE OF FOSSIL FUELS IN ELECTRIC POWER GENERATION

J. CORDELL MOORE
Assistant Secretary
United States Department of the Interior
Washington, D.C.

The tremendous growth in energy demand in the United States, to meet the requirements of an ever-expanding economy, is highlighted by a phenomenally increasing demand for electric power. While total energy increased by 58 percent between 1950 and 1965, consumption of energy resources for electric power generation increased by 131 percent.

Preponderantly, the root sources of energy to power the turbines of the electric utility industry have been the fossil fuels—coal, oil, and natural gas.

In 1966, nuclear energy provided less than 1 percent of the total power generated, and even the great hydropower resources of the nation provided only 17 percent of the kilowatthours generated. Thus, about 82 percent of the power was generated by fossil fuels, of which coal accounted for about twice as much as oil and natural gas.

But what of the future? If the past is any guide—and there is no reason to expect otherwise—we can expect that the demand for power in 1980 will exceed 3000 billion kilowatthours—nearly three times the demand in 1965.

Electric power will account for about 31 percent of total energy used in 1980, compared with 23 percent in 1965.

Within the past few years many things have happened which can, and will, change the energy mix used for power generation.

Developments of the next five years will have a significant impact on the extent to which the respective fossil fuels will share in the growing power market.

The two main factors are the growth of nuclear power generation and the severity, extent, and timing of air pollution regulations. There are other important factors, of course: the adequacy of the reserves of the different energy sources; the productive capacities of the industries to produce the fuels required; the costs and prices of the competing fuels; plant operating efficiencies; and the outcome of intensified research now under way, including the development of new methods for power generation.

All of these can be expected to affect in a multitude of ways the future role of the fossil fuels in power generation.

NUCLEAR POWER

Very significant strides have been made in the technology of nuclear generation of electricity, and new capacity announced during 1966 exceeded that announced for coal-fired plants.

This upswing has since declined.

The chronology of new nuclear plant capacity annouced or contracted since 1965 is as follows:

	MW
1st half, 1966	4,400
2nd half, 1966	9,600
1st half, 1967	21,000
2nd half, 1967	6,700

More importantly, during the past two years the costs of nuclear systems have increased as much as 40 percent in some cases, compared with significantly lesser increases for some coal-fired systems.

TVA, for instance, after ordering a nuclear plant in 1966 on the basis of competitive bidding, turned to a 1.3 billion kilowatt coal-fired unit for its next large plant, apparently because nuclear plant prices had risen so sharply.

Other factors affecting the rate of growth of nuclear power include the lengthy time lags in the delivery of new nuclear systems, the lack of experience in operating larger capacity plants, and reserves of uranium oxide.

As a result of these and other factors, it appears that many in the electric utility industry now are adopting a more cautious wait-and-see policy regarding nuclear.

Although air pollution is of little concern in nuclear generation, nuclear is not without its own environmental problems. Disposal of radioactive wastes is of vital importance, as is the prevention of thermal pollution of streams and coastal waters.

Measures to control these add to the ultimate costs of nuclear generation.

Difficulties are a common expectation of all new systems, but we cannot underestimate the value and importance of nuclear power generation.

On the contrary, the recent and continuing technological advancements in nuclear production of power have been most impressive.

They demand the respect and support of all who are interested in adequate supplies of energy for our future population and expanding economy.

AIR POLLUTION

Let us now turn to an even more pressing problem that will affect fossil fuel use in power generation and about which I will speak at length today—air pollution.

Most air pollution control ordinances, already enacted or under consideration in states, counties, and major metropolitan areas, include provisions restricting either the sulfur content of fuels or the sulfur oxide emissions to the atmosphere, or both.

Areas in which sulfur limitations have been imposed are widely distributed geographically.

Los Angeles County was the first, and since then sulfur limitations have been adopted for the Metropolitan New York area, Dade County (Florida), New Jersey, St. Louis, and in Montgomery and Prince Georges Counties (Maryland).

Other areas currently considering air pollution controls on sulfur and sulfur oxides are mainly in the eastern part of the United States, and we can be sure that similar restrictions will be established, in one form or another, by additional governmental jurisdictions.

Natural gas, because it is relatively free of sulfur compounds, is not affected, but users of coal and residual oil will have to find some means to meet these new regulations.

To meet new antipollution requirements for sulfur oxides the following three alternatives are being given major attention:

1. New sources of fuel supply.
2. Fuel desulfurization processes.
3. Sulfur oxide removal processes.

There are other alternatives, such as the use of tall stacks and the location of new plants in rural areas, both of which will reduce ground-level concentrations of sulfur oxides. At best, these are interim solutions since they do not contribute to the overall reduction of air pollutants.

Another alternative to which considerable research effort is being directed is the development of new methods of power generation, for example, magnetohydrodynamics (MHD), electrogasdynamics (EGD), the fuel cell, etc.

These methods would not only contribute greatly to cleaner air through the higher efficiency of power generation, but would reduce thermal pollution of streams while conserving fuels.

Unfortunately, they are not expected to be commercially available for ten years or so.

First, let us consider new sources of fuel supply as one way to meet the new requirements.

It has been estimated that 95 percent of the coal con-

sumed in the 20 cities with the worst sulfur-oxide problems could not meet a 1-percent maximum sulfur content limitation.

In fact, one analysis indicates that more than 99 percent of the coal used in power plants in major metropolitan areas had a sulfur content over 1 percent. Since more than 96 percent of the total electric utility coal is consumed in power plants east of the Mississippi River, the largest potential source of supply of low-sulfur coals for these plants is concentrated in a small area comprising a few states in the southern Appalachian area.

In 1967, of the 264 million tons of coal shipped to electric utilities east of the Mississippi River, coals from this southern Appalachian area accounted for only 63 million tons, or 24 percent.

The remaining low-sulfur coals from this area were shipped principally to coke ovens of the steel industry and to United States coal export markets.

Our coal exports, incidentally, provide close to one-half billion dollars annually in credits to our international balance of payments.

In other words, if the electric utilities in the east are to meet the more stringent requirements of air pollution regulations, the coal mines in this relatively concentrated area will be called upon to increase substantially their productive capacity.

In total, the reserves of low-sulfur coal in this southern Appalachian area are adequate, but a large portion of them are owned by, or large tonnages are committed to, the steel industry.

Furthermore, these deposits are relatively costly to mine, and their longer distance from utilities would make them more costly than the higher sulfur coals now consumed in these plants.

Depending on the plant location, cost increases of from 25 to 40 percent can be expected.

As in the case of coal, the future of power generation from residual fuel oil will be affected materially by air pollution controls.

About 90 percent of the residual fuel oil consumed on the eastern seaboard where the sulfur oxide problem is

developing is imported, principally from Venezuela and the Caribbean, and ranges in sulfur content from 2 to 3 percent.

The other 10 percent of the residual fuel oil consumed on the East Coast is produced in this area from domestic and imported crudes.

Domestic crudes, and thus, residual fuel oil produced from them, are relatively low in sulfur content, averaging about 1.6 percent, but they comprise a very small portion of the total consumed in this area.

Accordingly, the residual fuel oil consumed in power plants on the eastern seaboard in 1966 contained an average of about 2.5 percent sulfur.

Given adequate lead time, additional amounts of low-sulfur residual from low-sulfur crudes could be made available to East Coast plants.

Based on recent price differentials, this may cost 20 to 30 percent more than is now paid for high-sulfur residual fuel oil.

Natural gas is a significant factor in power generation, accounting for about 22 percent of energy used in power generation last year.

It should be noted, however, that nearly 85 percent of the natural gas was used for power generation in areas west of the Missippi River.

It is expected that most of the increase in natural gas used for power generation will develop in the west and will not offer a satisfactory answer to the sulfur dioxide problem in the east.

The immediate problems of using natural gas extensively as a substitute for coal and oil to meet air pollution regulations are inadequate pipeline capacity in relation to the quantities involved and the substantially higher cost of service on a firm basis over that on an interruptible schedule.

A second way to reduce sulfur oxides is by fuel desulfurization processes.

In the case of coal the degree of sulfur removal depends essentially on the amount of pyrites present and how they are dispersed in the coal.

The number of coals amenable to sulfur reduction are somewhat limited.

Furthermore, the use of conventional processes to effect substantial reductions in sulfur content are quite costly. For example, to reduce the sulfur in a Pittsburgh bed coal from 2.5 to only 1.5 percent would cost about $3.00 per ton.

Detailed information on the costs of desulfurizing residual oil is not available, but a recent study by the Bechtel Corporation estimated that the incremental cost of reducing the sulfur content of typical Venezuelan crudes from 2.6 percent to 1.0 percent would be 58 cents per barrel.

Since the density of the product is lower than of the high-sulfur feed to the process, the desulfurizing cost would be 72 cents on a per Btu-equivalent basis.

In this case, the East Coast delivered cost of residual desulfurized to 1 percent sulfur would increase by 30 to 40 percent.

Moreover, it will require adequate lead time to make available large amounts of low-sulfur residual fuel oil to the East Coast, and then only at a substantial increase in fuel costs.

The third method for sulfur oxide control is through stack removal processes.

During the past few years, research and development efforts have been expanded considerably on processes designed to remove sulfur oxides from the gases in the combustion chamber or in the stacks of plants burning high-sulfur coal or residual fuel oil.

More than twenty different organizations are engaged in this activity, and progress has been encouraging.

On the basis of tests to date, the cost of removing sulfur-oxides from stack gases will be substantially less for most large new plants—and I repeat, for most large new plants—than the cost of substituting fuels or of removing sulfur from fuels.

In each case the stack-removal process is cost-sensitive to certain factors, and the values have not yet been fully defined.

Against this background of nuclear energy develop-

ment and the impact of air pollution regulations, what will be the future role of fossil fuels in power generation?

About 3 years ago the best estimate for installed nuclear capacity was 70,000 megawatts by 1980.

On this basis, and with air pollution at that time being considered to have only a minor impact on fossil fuel use, we estimated that the utility industry would consume 554 million tons of coal, 137 million barrels of oil, and 2.87 trillion cubic feet of gas.

In nearly every year since 1964, the estimates of installed nuclear capacity have been increased, and the most recent estimate by AEC is now 150 to 170,000 megawatts by 1980

With the long delivery times for nuclear plants, the recent decline in nuclear plant orders, and the concern over uranium supplies, these recent estimates of installed nuclear capacity may not be revised upward sharply as they have in the past.

The impact on the energy-mix of the greatly increased emphasis on air pollution is much more difficult to evaluate.

Obviously, the demand for electricity which will exist in 1980 will have to be satisfied.

The supply of hydroelectric power is relatively inelastic, so that the balance of the kilowatts that will be needed will have to be supplied by fossil fuels, after allowing for the best estimates of those that will come from nuclear energy.

Under these circumstances, while there may be some shift between the competing fuels due to the impact of air pollution regulations, it is clear from our evaluation that no major shifts between the fuels can be expected by 1980.

There could, however, be very appreciable changes in the *sources* of supply of the individual fuels, at least until successful sulfur dioxide removal processes are developed.

Taking all the new developments into consideration and if the AEC estimates of 150,000 MW by 1980 prove correct, present projections for fossil fuel use by the utilities for 1980 would be reduced by the coal equivalent of about 200 million tons.

This is a decline of 30 percent from our Bureau of Mines 1965 estimates, but because of the growing demand for electricity it still represents an increase in fossil fuel use by the electric utilities of more than 150 percent over the present requirements.

The fossil fuels will have to continue to supply the largest share of energy for electric power generation for the next ten years.

In the longer term, however, their use could be curtailed unless increases in productivity, efficiency, and low-cost methods for controlling the detrimental effects on the environment—land, air and water—are found.

The prospects are good, however, that research can find the necessary methods to keep fossil fuels competitive in the electric utility market.

NEW HORIZONS FOR COAL— THE COMEBACK INDUSTRY

By ROBERT E. LEE HALL *
Senior Vice President, National Coal Association, Washington, D. C.

For the benefit of skeptical financial analysts and investors, Mr. Hall describes coal industry's successful comeback and limitless horizons, due to technological breakthroughs, and growing signs of oil, gas and even atomic energy limitations. He explains why electrical utilities have become coal's biggest customer, quotes Atomic Energy Commission Chairman Seaborg's admission regarding the increasing use of coal for the production of electricity over the next several decades, and cites statements by the gas and oil trade association as to the limitations of the fuels they respectively represent. Note is taken of coal's increasing exports, and prospects of making high-octane gasoline and quality gas from coal.

The coal industry is on the rise. That statement alone should startle anyone who has not looked at the modern coal industry in recent years. If you dimsissed coal from your mind a few years ago—wrote it off back in the days

when some phrase-maker characterized it a "sick industry,"—I can only report that you wouldn't recognize the patient today.

Coal production in the United States hit 532 million tons in 1966, up 4 percent from the previous year—and in 1967 was up about 7 percent ahead of last.

You may think that with an expanding population and continuing prosperity, this is not a significant fact. The United States used more fuel of all kinds than ever before. But consider this: For the second consecutive year, coal increased its share of the total energy market in the United States.

Time was when coal supplied almost two-thirds of the energy consumed in the United States. Less than 20 years ago, it supplied half. Then it hit the skids, thanks in large part to the competition of other fuel supplying industries. Coal had abundant resources, more than those of oil and natural gas, but it neglected the other side of this partnership—it let its technology lag.

When the superior efficiency of the diesel locomotive sent the old steam engines to the scrap heap, and when the superior convenience of oil and natural gas captured most of the home-heating market, coal lost two of its biggest outlets. About the same time, wages of miners rose sharply, and it became impossible to mine coal the old-fashioned way and stay in competition for the markets that remained. It was about this time that the writers began calling coal a sick industry, and it seemed like a good diagnosis.

But the coal industry breeds some stubborn men, whether they are miners or Chairman of the Board. The industry called on technology. The first step was to modernize the mining process. This has been done by heavy investment in complex machinery—but done so successfully that coal has bucked the trend of inflation. The average f.o.b. mine price of coal was $4.99 per ton in 1948; last year it was $4.55. The average miner produced about six tons a day in 1948; today he produces about 18 tons.

The business gamble has paid off, and bituminous coal today is a competitive fuel to be reckoned with in Amer-

ica's industrial economy. We acknowledge with some sense of gratitude, a debt to the financial community for gambling with us—and, of course, of having the same commendable confidence, wisdom and foresight as the coal producers themselves!

Coal's Biggest Customer

With increased ability to get coal out of the ground quickly and economically, we still needed some place to sell it. That place was the electric utility industry, which has been doubling its capacity every ten years. Electric generating stations are now coal's biggest customers, taking more than half our output and using it to generate more than half of the electricity in the United States.

Between mine and market there was the problem of costly transportation. The railroads gave us a big part of the answer with unit trains—hauling 10,000-ton lots direct from a single mine to a single power plant at rates as much as 50 percent below the old single-car tariff. By drastically cutting lost time—or by utilizing rolling stock more efficiently—and by reducing the amount of paperwork involved in freighting coal to market, the coal-carrying railroads have been able to make substantial reductions in shipping rates, in some instances by as much as $1.50 per ton. These economies extend coal's ability to compete in domestic energy markets at a time when competition is keener than ever.

About one-third of our coal output comes from surface mines—the strip mines—where mechanical giants, looking for all the world like prehistoric monsters, remove the overburden from the coal seams and expose the coal for smaller shovels to scoop into huge trucks. This mechanical revolution in the coal mining industry is far from complete, according to all indications. Coal mining equipment manufacturers have on the production lines and their drawing boards, more efficient machinery to raise to even greater levels the amount of coal produced on a ton-per-man basis.

About 100 million tons of coal is moved annually along America's inland waterways, and bigger tows of coal-

carrying barges again are resulting in reductions in the cost of delivering coal to customers. New and more efficient loading and unloading machinery at inland docks adds to the savings.

Meanwhile, the utilities have been busy with technology, too. In many places they are building mine-mouth power plants which consume up to two million tons of coal a year from mines right next door, and then ship their power over extra-high-voltage transmission lines to load centers 300 miles or more away.

One other mode of transportation, developed by the coal industry itself, is the coal pipeline. This is a perfectly feasible system—it has helped convince the railroads to try unit trains. The unit train rates closed down a 108-mile pipeline that operated for five years in Ohio—but where no rail service is available, it's still a good way to move coal. In fact, the Southern Pacific Railroad is getting into the coal pipeline business; with the Southern California Edison Company it is building a 275-mile line from a new Peabody Coal Company mine in northeastern Arizona to a power plant in Nevada. The plant will supply electricity to California—and that's one new horizon for coal. This is coal's first large-scale invasion of the huge West Coast energy market.

It won't be the last. There are tremendous coal reserves in the Rocky Mountain area. Between them and the huge energy demand in California lies nothing but a few hundred miles of difficult geography. Technology is already bridging that gap.

Well, what about the horizon for coal? What lies ahead?

First, what about our biggest market, the electric utilities? Will we hold on to it?

That's a good question, and I'm glad I asked it. There are half a dozen answers, and all of them are "Yes"—coupled with different reasons.

Utilities Market

Utility decisions to burn coal in new generating plants are being made on the basis of sound economic facts of life. Electric power industry executives know, for ex-

ample, that bituminous coal is the most economical fuel available for generating station use in the United States.

In 1965, the most recent year for which we have complete data, the national average cost of coal burned in steam-electric power generation was 24.4 cents per million Btu. Natural gas ranked second at 25.0 cents, and oil was a rather distant third at 33.1 cents per million Btu.

I was too modest when I said coal generates half the electric power in the United States. When we take the 80 percent of the power produced by steam-driven generating plants, using some sort of fuel, coal's share of the market goes up to 65 percent. And it's a growing market —it took 265 million tons of coal last year, up 9.2 percent from 1965. This year, we expect the utilities will burn about 281 million tons.

Export Market

A significant element of strength in coal's future lies in the export market, where American coal is becoming more competitive (and necessary) than ever. Thirty percent of the coal we now export comes here to Canada to be used for metallurgical purposes, for electric power generation, and for general industry markets. The European Common Market countries take another 40 percent of the U.S. coal exports, primarily for metallurgical use, although almost all of our exports to West Germany go for other uses. Exports to Japan, accounting now for about 15 percent of total foreign shipments, are entirely metallurgical.

Colliers capable of carrying 80,000 tons or more are now in use, and more are under construction. At our East Coast ports, such as Hampton Roads, modern equipment permits loading of these huge colliers in a matter of hours, reducing turn-around time to a minimum.

Obviously, with that share of the market and that sort of price structure—not to mention comparative reserves—coal is going to be around a long time in the existing plants of the electric utility industry.

Unquestioned Reserves

On second thought, I will "mention" comparative reserves. Both in our own country, and elsewhere throughout the world, questions are being raised about the adequacy of reserves of oil, natural gas and uranium—the necessary ingredient for atomic power. U.S. coal is not subject to such question. Measuring current recoverable reserves of coal in the United States against present and projected demands reveals some 830 billions of tons of recoverable coal yet to be mined in the United States, reserves sufficient for the next 1,000 years.

Up to this point, I haven't said a word about competition, present and anticipated, from atomic energy. I will now say several.

Let's examine these partners for progress: resources and technology. Housebreaking the atomic bomb, harnessing nuclear energy to produce electric power, is surely the greatest technological triumph of the first two-thirds of this century. In many countries, and particularly in my own, great amounts of scientific manpower, and great gobs of the taxpayers' money have been spent on it.

And, to a degree, this massive effort has succeeded. The technology of atomic energy has been developed until it is, in many areas of the United States, competitive with power generated from coal—or oil, or natural gas.

Atomic Costs Are No Longer Cheaper

I might add here that this competitive status, proclaimed in public statements and image-building advertising by the makers of atomic reactors, has apparently been attained at the expense, at least in part, of their stockholders. For example, General Electric landed a contract for two large atomic power units for the Tennessee Valley Authority, and made much of the fact that they were supposed to produce power more cheaply than coal.

But then GE announced a price increase, and admitted in its annual report that its reactor division had operated for years at a loss; with the price increase, GE said, it hoped to make a profit on the division for the first time. In other words, all the reactors it had sold

previously, including the two to TVA, were subsidized by GE shareholders.

Two or three months ago, TVA again ordered new generating equipment—but this time it said that because of increases in the price of reactors, coal and atomic power were again running neck-and-neck. It ordered a third reactor to go with the two previously bought—but it also ordered a new generating unit, which will be the largest ever built, and it will be powered with coal.

So as to technology, let's say for the moment that coal and atomic power are about even in the electric utility market. But how about the other partner, resources?

As I mentioned before, and repeat for emphasis again, in the United States, the very conservative U.S. Geological Survey says we have 1.6 trillion tons of coal. Using the rule of thumb that half the coal in the ground is recoverable, that is a resource of 830 billion tons of coal. In fact, coal constitutes 68 percent of all U.S. mineral fuel resources, including oil, gas and such undeveloped resources as oil shale.

Low Uranium Supply

On the other hand, low-cost U.S. uranium resources, although among the largest in the world, are only a fraction as great in terms of energy content. In fact, fraction is too impressive a word—would you believe a quarter of one percent? Known reserves of uranium oxide, or yellowcake, in the United States are 140,000 tons. This is energy equivalent to two billion tons of coal—or about as much coal as U.S. utilities will burn in the next eight years.

In fact, the United States does not have enough low-cost uranium—and by low-cost I mean around $8 per pound of yellowcake, or about the cost of the fuel for the reactors which are now competing with coal—to assure a fuel supply for the expected life of the reactors now operating, under construction or announced.

I did not invent these figures. They are based on public statements of officials of the U.S. Atomic Energy Commission, and the Chairman of the Commission, Dr.

Glenn T. Seaborg, has conceded the correctness of our calculations. In fact, we differ with the AEC on this question in only one major respect—AEC says an intensive search for more uranium is under way, and it expects to find more. We say more uranium will undoubtedly be found—but we are skeptical that anyone will find the fantastic amounts that will be required to meet the grandoise plans of some atomic energy promoters.

Squandering Our Reserves

For the type of reactors being built now are highly inefficient consumers of uranium. AEC is trying to develop more efficient ones, including the so-called fast breeder reactor which would convert atomic fuel into fissionable form at a greater rate than it consumes it, so that after 12 to 15 years, such a plant would be able to refuel itself and another of the same size. (You can see that even the fast breeder willl not entirely meet the needs of the utility industry evem if it keeps doubling very ten years.)

Though our supplies of coal are vast, they are finite. Some day we will need our low-cost uranium much more than we do now—need it to fuel the first fast breeders. But AEC is squandering it now in slow, inefficient, unneeded reactors—feeding the seed corn to the hogs. It is putting its trust on a long-shot hope that somewhere, somehow, it will find more uranium—enough more, and cheap enough, to replace that being squandered today. Like Mr. Micawber, it lives in the confident expectation that something will turn up.

Charles Dickens would be thunderstruck. He conceived Mr. Micawber as a shabby-genteel failure, not a policy guide for a well-tailored multi-million dollar industry and a great shiny government agency.

Advises Canada Not to Sell

Now I am quite aware that Canada has a lot of uranium—perhaps more than the United States, and certainly more than Canada now needs. If the United

States is short of uranium, it represents a market for the Canadian product—but I suggest that Canada ought not to sell.

Only three countries of the free world have substantial uranium deposits. One is the United States, which as we have seen will need to keep all its uranium for its own use. Another is South Africa, which produces a limited amount of uranium as a by-product of its extremely deep and difficult gold mining, but cannot increase this output greatly except at skyrocketing cost. That leaves Canada with the main supply of uranium available to the rest of the free world.

Many energy-poor nations are turning—or want to turn—to atomic power for their industrial development. Because they must import conventional fuels, or the cost of producing their own fuels is high, they can afford to pay more for atomic fuel than can the United States. It is in these countries that Canada should sell its uranium. There it will do more good—and there, frankly, Canadians will make more money. If some of these countries are not yet ready to buy Canadian uranium, just wait. They will be.

Well, I have given you a long answer to a short question, what about atomic power? Dr. Seaborg answered it more directly and with more authority recently when, as Chairman of the Atomic Energy Commission, he declared:

> "Atomic energy will play an increasing role in the production of electricity, but I do not believe it will eliminate the use of coal and oil for this purpose for many, many years to come. Present projections show an increase in the use of coal for the production of electricity for the next several decades, because power needs will grow so fast that all our energy resources must be employed. It is clear that coal will play an important role in our future energy supply picture."

Sulfur Pollution

Without conscious attempt to pun, one "cloud" on coal's horizon is the over-response of local air pollution authorities to the enormous effort of the U.S. Public Health Service to point an accusing finger at sulfur dioxide from coal burning as a public offender. We feel confident, however, that the rule of reason will eventually prevail since recent Congressional hearings have proven that HEW has been moving too fast in the field of accusation without sufficient proof. Tall stacks offer the only existing feasible technology to minimize sulfur dioxide in any significant amount at ambient levels. The "state of the art" has not yet developed other feasible control methods. However, research by industry and government is at the "breakthrough" stage and we believe solutions are at hand.

Similar research efforts in the past have been successful in developing a technology which makes it possible to control more than 99 percent of the soot, dust, and ash from coal burning, thus removing one of the former problems encountered in coal burning. The coal and utility industries are now spending millions of dollars on research to control sulfur oxides. Congress in the new clean-air bill is considering authorizing accelerated Federal research on the subject. We are confident, therefore, that these problems will be met before serious damage is done to the coal complex.

A few other factors of coal's future with electric utilities: Nearly all major utilities are buying coal now on long term contracts—some as long as 30 years. This is a big new stabilizing factor in the coal business, where once the practice was to get a mine ready and then operate it when, as, and if your salesmen could dispose of the coal on spot contracts. Now a company, assured that money will be coming in on a contract for 30 years, can dedicate a whole new mine to that customer. You may be hearing more about this, for the company may be coming to the financial community for capital to install the mine.

I'm afraid I've given the impression that the coal industry is placing all its bets on the electric utilities. It

isn't. Most other present markets will increase, though not at such a pace.

Coal By-Products

But there are bright horizons in new directions for coal. At the risk of making analysts unhappy, I can report good prospects for high octane gasoline and pipeline-quality gas from coal.

There is now in operation at Cresap, West Virginia, a pilot plant for producing gasoline from coal. The process was developed through research by Consolidation Coal Company. The plant was built under a contract between the coal company and the U.S. Office of Coal Research of the Department of the Interior. There is every reason to expect that the gasoline produced at this plant will be reasonably competitive with gasoline produced from crude oil. Another process, the H-coal process under development by Hydrocarbon Research, Inc., of Trenton, New Jersey, under another OCR contract, is also moving forward toward the pilot plant stage with equally good prospects for success.

While the competitive factor is an important aspect of gasoline made from coal, bear in mind that domestic reserves of crude oil in the United States are limited, while coal reserves are not, in terms of long-range demands. Proven U.S. petroleum reserves are reported now at approximately 31 billion barrels, which represents a reserve life index of only 10.98 years supply,[1] with total world reserves listed at 300 billion barrels. By contrast, it has been estimated that recoverable reserves of U.S. coal contain 2,300 billion potential barrels of oil—that's 2 trillion, 300 billion barrels! No wonder we feel there is a justifiable bull market on coal! And on coal STOCKS for that matter!

Under joint industry and government sponsorship, coal gasification research is forging ahead. The so-called carbon dioxide acceptor process and the hydrogasification process are at relatively advanced stages of development. It is now possible to project future pipeline quality gas production costs based on coal as the raw material—and the product appears to be competitive.

The need for gas from coal only incidentally results in the development of a new market for coal, since reserves of natural gas in the United States, like those of petroleum, are also limited. New gas discoveries are not sufficient to reverse the downward trend of the reserve life index of natural gas, now only at 16.54 years supply.[2] Supplemental supplies of synthetic gas will inevitably be needed later in this century, and the coal industry will be ready to supply it at competitive prices because of research being pursued.

This is what the modern American coal industry is all about, and what the future looks like to us who are in it. Nor is it just partisan optimism, for there is an abundance of factual evidence to justify the confidence in coal, despite the implications of the atom, environmental problems, or the rising cost of labor and materials. Utility systems are entering into long-term contracts with coal producers, who in turn are dedicating production from new mines to meet the lifetime needs of new generating plants. High-quality coking coal from U.S. mines also is being shipped to overseas destinations under long-term contracts.

All in all, the bituminous coal industry in the United States is a healthy segment of our economy. In looking ahead, we are not arbitrarily downgrading the importance of the environmental problems that must be solved if our projections are to be realized. The fact is that we have already discounted—in the investors' sense—any pervasive effect on future markets inherent in the public's proper cry for cleaner air, beautification of the land and purification of our water. These problems must and will be met in a partnership between industry and government.

One hundred years from now we may not recognize our cities as you see them today. There undoubtedly will be excursions run to the moon and, perhaps more unbelievable, there may not even be a KENNEDY in public office—but as Churchill once said of England, there will always be a coal industry.

In 2067 we will have only a 900 year coal supply left over. Yes, the "New Horizons for Coal" are limitless. You

cannot see the end! In the coal industry there has indeed been a shotgun wedding between "Resources and Technology" and we believe we are unbeatable "Partners with Progress"—a successful marriage that no man can put asunder.

NATURAL GAS FIASCO

Federal Price-Fixing Is Finally Producing a Shortage

EL PASO Natural Gas Co., which (according to an article in Barron's barely six months ago) was supposed to be "Making Fewer Headlines, More Money," last week made quite a splash on the financial page. The company announced that it has signed with Sonatrach, Algeria's state-owned petroleum monopoly, "definitive agreements for the largest liquefied natural gas (LNG) project in history," one which involves capital outlays of nearly $1 billion and is designed, starting in the fall of 1973 and extending nearly to the end of the century, to deliver one billion cubic feet of fuel per day to East Coast ports. Besides pipelines and the like, the project calls for the construction of liquefaction and regasification plants, as well as nearly a dozen specially designed vessels, biggest of the kind ever built, to carry the frozen gas. "This will mark the first time that energy supplies of this type have been imported into the U.S. on a permanent basis," the company proudly observed, adding that it was "particularly pleased to be associated with this pioneering venture. . . ."

* * * *

Apart from its unprecedented size and scope, the project is noteworthy on a number of counts. For one thing, if carried out faithfully by both parties, the contract will mark a welcome change in the commercial practices of the Algerian Government, which up to now have smacked less of the Harvard Business School than of the Barbary Pirates. Since gaining independence a decade ago, Algeria has seized without compensation a vast amount of foreign property, including banks, insurance companies

and the personal possessions of thousands of former French residents. Sonatrach—Societe Nationale pour la Recherche, le Transport, la Transformation et la Commercialization des Hydrocarbures—launched its career three years ago by borrowing $15 million from a couple of gullible U.S. banks. No sooner had the ink dried on the loan agreement than Algeria began pressuring the American oil concerns on the scene to submit to discriminatory treatment regarding royalties and taxes. Since then Algiers (which broke off diplomatic relations with Washington during the last Israeli-Arab War) has "sequestered," or confiscated, the bulk of U.S. investment within its borders, including concessions held by El Paso Natural Gas. "Never do business with a man you can't trust," advised J. P. Morgan, but the old man has been dead a long time. Perhaps the company will come out all right.

That's the stockholders' worry. Profitable or otherwise, the huge transaction, which last week's announcement said was "designed to ease U.S. gas supply problems," has disturbing significance for the whole country. For it plainly indicates that domestic reserves of the useful and versatile fuel, once deemed inexhaustible, are not keeping pace with future needs, an alarming state of affairs which the Federal Power Commission belatedly has come to recognize. Just a fortnight ago, the FPC, which regulates interstate distribution of natural gas from wellhead to burner tip, released a staff report on supply and demand, warning that within the next five years—sooner in some areas—a critical nationwide shortage will flare. What the agency failed to point out is that its own regulatory policies, by deliberately (if not with malice aforethought) imposing an artificial lid on prices, have been largely to blame. Price control will always have its blind worshipers (hi there, Professor Galbraith). Only the free market, however, can keep the home fires burning.

For the past 15 years, to be sure, the regulatory bodies have been singing a different tune. In 1954, the U.S. Supreme Court, in a singularly ill-advised decision, thrust on the Federal Power Commission authority to regulate not only transmission and distribution companies but also

producers of natural gas. Since then, despite protracted litigation, the FPC has gradually extended its sway. The agency has decreed, beyond further legal appeal, area prices of approximately 15.5 cents per thousand cubic feet of gas for the Permian Basin. (Ceiling prices for all other major areas are still in dispute.) The ceiling for Southern Louisiana was finally set by the FPC at nearly five cents per mcf., or 20%, below the provisional guideline posted eight years earlier. As in the Permian Basin rate case, moreover, the FPC employed in its calculations 1960 cost figures, which it so far has refused to up-date. Thus, according to Stanley Learned, director and former president of Phillips Petroleum, the government has "established a concept for producer prices under which the industry cannot recover its costs."

Such policies have naturally warmed the hearts of users. However, producers, discouraged by lack of incentive, have sharply curtailed their efforts. Completions of U.S. exploratory gas and condensate wells declined from 909 in 1959 to 429 in 1968. In the latter year, for the first time in history, net production exceeded additions to reserves. The reserves-to-production (or R/P) ratio today stands at only 14.6, or considerably less than a 15-year supply, barely two-thirds of what it was when the FPC acquired jurisdiction. Some pipelines are unable to contract for future needs; hence, expansion programs are in jeopardy. Now El Paso Natural Gas Co. has decided to go four thousand miles overseas for fuel which will cost more than 50 cents per mcf., perhaps half again as much as gas moved by pipeline from the Gulf Coast.

Even the federal regulators, as noted, have finally grown concerned over what they have wrought. Early this month the FPC issued a staff report that didn't make pleasant reading for the boss. In brief, it concluded that the national reserves-to-production ratio would decline to 10.2 by the end of 1973. "Even a substantial improvement in reserve additions above that experienced during the past five years will not prevent the R/P ratio from dropping to about 11." Regional gas supply deficiencies are likely. "The uncommitted portion of the total

proven reserve inventory will have been exhausted by 1974, at which time the natural gas industry's capacity for growth will be limited." None of the foregoing, said a miffed Commissioner, provides "the basis for a round of price increases." Nonetheless, the full Commission has swiftly moved to make a start. On October 3 the FPC decided to treat as new supplies (hence, worth more money) all gas henceforth discovered on acreage already committed to the interstate market. Last Tuesday in what the agency described as a "turning point" in regulation, it decided to liberalize the pricing of gas reserves which pipelines themselves own.

• • • •

Too little, say industry spokesmen, and too late. To meet the looming emergency, in the view of Phillips' Learned, the Commission must take more far-reaching steps, including reconsideration of its Southern Louisiana decision; approval of an increase of at least five cents per thousand cubic feet in both wellhead and flowing gas; and recognition in price-fixing of "changes in taxes and the results of inflation." For the long haul, Mr. Learned approvingly quotes the views of Dr. Clark A. Hawkins, associate professor of finance and economics at the University of Arizona, and authority on the subject. In a new book, the latter writes: "The market should be the mechanism for determining price because natural gas price fixing by governmental fiat is not only unnecessary but unworkable as presently attempted. Also, it is only the market that will give the lowest price consistent with maximum output in the long run. The standard of market price could be feasible under existing law if the Commission would espouse it and proceed to the courts." Failing that, of course, a Congress truly responsive to the needs of consumer and producer alike could undo the longstanding judicial mischief.

Like El Paso Natural Gas Co., we would be inclined to bet on the sorry status quo. The East Coast doubtless will come to rely for fuel on a source of supply that is unfriendly at best and, at the slightest provocation, downright hostile. As the U.S. proceeds to import natural gas

—at higher prices, be it noted, not lower—the poor old balance of payments will suffer a fresh, and wholly gratuitous, setback. "Economists," so Dr. Milton Friedman has said, "may not know much. But we do know one thing very well: how to produce shortages and surpluses. Do you want to produce a shortage of any product? Simply have government fix and enforce a legal maximum price on the product which is less than the price that otherwise would prevail. . . ." He should be teaching at Harvard.

NUCLEAR POWER ECONOMICS: 1968-1969

[¶ 3043]

Philip Sporn analyzes competition in power generation.—Reproduced below is the full text of a report prepared and submitted by Philip Sporn to the Joint Congressional Committee on Atomic Energy on the developments in nuclear power economics during the period from January 1968 through December 1969.

Mr. Sporn finds cause for concern in the increase in the costs of power generation from fossil fuels and particularly nuclear fueled plants. The increased costs of nuclear power, in Mr. Sporn's opinion, has greatly injured its competitive position, especially in view of the fact that such high economic hopes were held for it at its inception.

Developments in Nuclear Power Economics: January 1968—December 1969

Report Prepared for the Joint Committee on Atomic Energy by Philip Sporn, Retired President, Consultant American Electric Power Company

Part I

The Retrogression in the Competitive Position of Nuclear Power vis-a-vis Fossil-Fueled Power:

During the past two years there has taken place a remarkable and ominous retrogression in the economics of our nuclear power technology. The light-water-moderated reactor, which two years ago offered potentials for nuclear power generation competitive with fossil fuel at 22¢ to 24.8¢ per million Btu, has today lost position where it is competitive at 28¢ to 29.5¢ per million Btu fossil fuel cost.

This in turn makes it difficult to accept without something more than a grain of salt the statement of the Atomic Energy Commission [1] "the outlook for the future for nuclear power continues to be very promising (because) of the continuing economic competitiveness of nuclear power in spite of increasing costs as prices for both nuclear and fossil plants increase."

How did this come about? The reasons for that are many. Among the most important, but nowhere near all, are higher costs of nuclear components, higher cost of turbines, higher construction costs, continuing escalation during the entire construction period due to the inflationary cycle, longer construction time which results in higher interest and overhead charges, higher capacity charges in view of the current coupon rate of approximately 9.5% on AA utility bonds which brings the necessary capital charge to give an adequate return up to 16%, lower capacity factor due to the recognition that with the growth of atomic power which will take place between now and 1980 no atomic plant can, except for the shortest time, be expected to operate at a capacity factor as high as 80% and that, therefore, a more rational capacity factor is one five points lower, or 75%.

It is true that fossil fuel costs also have gone up, but even so, nuclear power has lost position vis-a-vis fossil fuel (mainly coal). This can be seen very clearly in Table 1, which shows costs of both coal-fired and nuclear-fueled plants, the former in terms of an 800-MW unit and the latter in terms of an 1100-MW unit, as of July 1, 1969, for completion in the case of nuclear in 1976, and in the case of coal in 1975. All the figures in that tabulation are significant and striking but two stand out in particular—the cost of switchboard delivered nuclear energy of 7.06 mills per KWh as against 6.65 mills for coal-fired energy with coal at 25¢ per million Btu. On the basis of these figures, the competitive break-even point for nuclear power is 29.7¢ per million Btu coal cost.

---

[1] *The Nuclear Industry*, 1969, page 11, U.S.A.E.C.

I believe these are in a sense idealized costs, but yet they have in them the element of being hardheaded and pragmatically attainable figures based upon achieving every legitimate economy.

I am further convinced of their soundness in the light of:

1. Actual costs of a nuclear project completed during the year involving a 600-MW unit where the capacity factor employed was higher—80%—and the capital charge lower—15% which yielded an expected production cost at the switchboard of slightly over 8 mills per KWh, and

2. On a second job undertaken during the past year and carefully evaluated where the nuclear unit was in the 800-MW range and where the capital charge employed was higher—16.6%—and the capacity factor was slightly higher, the expected levelized cost obtained was very close to 7.8 mills per KWh.

It is not surprising that all these developments have already had a significant effect on the recent experience of the nuclear industry. It has caused cancellation of one or two previously announced projects, delay in scheduling of other units committed for; it has brought about interposition of fossil fuel units to be completed ahead of what might have been scheduled atomic units, and in some cases it has brought about plain decisions to go fossil when, if things had gone differently, atomic units would have been orderd. In connection with the last, it needs to be pointed out that every time a fossil-fueled unit is ordered for whatever reason, where an atomic unit might have been ordered under conditions more favorable to nuclear power, the particular nuclear unit is lost for approximately 30 years.

Memorandum to: Mr. R. J. Hepburn

In connection with your memorandum of October 8, I am sorry that the underground miner did not perform. I believe this method of mining has a great future, but underground mining is not our business, and under the conditions, I think the only thing for us to do is to continue to wait until someone in the deep mining field produces a working machine and a workable system.

President

DEFENDANT'S EXHIBIT 2

October 18, 1957

MR. F. F. KOLBE

Re: Northern States Power Company
Displacing gas with coal

We have had several discussions with Mr. Hoffman of the above company, trying to replace some of the gas they are burning with our coal moving in Midwest barges.

With their present gas contracts, they could consider displacing 600,000 MCF (approximately 75,000 tons of coal) now costing them 24.94¢ per million, and 800,000 MCF (approximately 100,000 tons of coal) costing them 23.9¢ per million. The average of these two is 24.4¢ per million. Unloading, storage, ash handling and all of the labor connected with handling coal versus gas—using a very reasonable figure by them—is placed at 1.4¢ per million.

This means we would have to sell this block of coal at 23¢ per million or $5.20 per ton inboard barges at their plant. Our total transportation cost at present is $2.12, leaving $3.08 f.o.b. mine for this 175,000 tons additional business.

Our present contracts with them we estimate will net us at the mine next year, with our present barge and rail rates, $3.986. The average price on the total tonnage would therefore be $3.67. Our portion of the above would be 150,000 tons at $3.986 and 87,500 tons at $3.08.

I have a date with Mr. Hoffman for Wednesday of next week and would like to talk with you before that time.

Chicago 2, Illinois

Dear Harold:

Attached is copy of an excerpt from the opinion of Trial Examiner Francis L. Hall in one of the Tennessee gas cases consolidated with the Canadian gas cases, in which he comments on the position of coal in natural gas cases. This illustrates that coal is not going to get any help from the Federal Power Commission under the present laws, and that the coal industry is going to have to meet the competition of natural gas by their own marketing efforts, and that the railroads are in the same boat.

I thought you might like to look at this finding of the Examiner.

Yours very truly,

/s/ Andy

Excerpt
From the Opinion of
Trial Examiner Francis L. Hall

In the Matter of
Tennessee Gas Transmission Company
(Docket No. G-11107)

Opposition of Coal Intervenors

The Coal Intervenors, namely, National Coal Association, United Mine Workers of America, Fuels Research Council, Inc., Maher Coal Bureau, Anthracite Institute, Truax-Traer Coal Company, Baukol-Noonan, Inc., and Dakota Collieries, Inc., as representatives of competitive fuel, transportation and labor interests, presented extensive evidence in the consolidated proceeding in opposition to the expansion of natural gas service in the midwest. This presentation appears to be designed to show the impact of displacement of coal by natural gas in the competitive area and will be considered in detail in the Examiner's final decision dealing with the competitive issues.

However, in the event any part of the evidence presented by the Coal Intervenors be construed by them to relate to (1) the proposals in Docket G-11107, (2) the disposition herein made of the issues involved in this docket, or (3) the issues to be disposed of in other decisions to be issued by the Examiner prior to the final decision involving the competitive issues, the following considerations control the dispositions made.

Underneath the efforts of the Coal Intervenors is an understandable impulse to prevent competition and protect coal markets. Their position can best be understood by keeping two things in mind. First, that the coal industry is constantly competing with the suppliers of

---

[23] As one of the witnesses for the Coal Intervenors testified, "I think that coal in the future should expand, though probably a gradual rate, providing, of course, we have sound economic conditions for fuel development." Coal consumption in the United States in 1956 was the highest since 1931.

other forms of energy for the consumer's dollar and it is the needs and wants of the consumer, not the actions of a regulatory commission, that determines, or should determine the extent to which a particular industry shall prosper.

In this day and time people do things differently and better. They prefer the modern way of life and its conveniences and are mindful of the fact that gas has brought greater prosperity and better standards of living. Unless there exists in the consumer's mind an atmosphere favorable to a particular fuel sale, the sale becomes impossible in a competitive market. Accordingly, for the coal industry or any other fuel industry to win the competitive sales battle it must give fuel consumers a better reason for buying its product.[24]

---

[24] The one factor which is perhaps giving natural gas distributors their greatest concern today is the skyrocketing prices paid to producers for, as hereinabove indicated, a continuation of such increases could push the cost of gas to the point where the average consumer cannot afford to pay for it or convert to its use. This factor, however, can be controlled by the Commission in appropriate circumstances (*Signal* case, *supra*) and may have to be controlled to prevent nullification of the "primary aim" of the statute which is "to protect consumers against exploitation at the hands of natural gas companies" (*F.P.C.* v. *Home Natural Gas Co.*, 380 U.S. 591, 610; *Phillips Petroleum Co.* v. *Wisconsin*, 347 U.S. 672, 685). Whether the Commission can or should exercise its discretion in a certificate proceeding to keep producer prices down to the point where they will not exceed average field prices is one of the issues presently pending for decision before the United States Circuit Court of Appeals for the Third Circuit in *Public Service Commission of the State of New York, et al.* v. *F.P.C.*, Nos. 12,401 and 12,403. This case involves the contract price for CATCO gas reserves acquired by Tennessee as a part of its over-all gas supply relied on in Docket G-11107 (17 F.P.C. 732, 890).

It would appear that every increase in the field price of gas that is allowed to become effective will prove to be another shot in the arm for the coal and other fuel industries and a darkening cloud for the pipelines, distributors and consumers.

Under no circumstances should the producer's appetite for higher field prices be permitted to become a pit into which any segment of the industry may fall. Stated another way, the profit sheet of the producer is not the only yardstick of a healthy industry, for now that billions of dollars have been invested the investments must

Obvious factors account for the ascending demand for natural gas for both home and industry use. Gas rather than some other fuel has carried a greater selling power in the home because of its convenience, cleanliness, laborless features, and the further fact that up until now it has generally been cheaper than other fuels. Where industry has converted to the use of natural gas it has done so to reduce costs, improve products and processing methods, and develop new products.

The coal industry's drumfire of opposition has been aimed at practically every expansion of natural gas service, for such industry has been and continues to be alarmed about encroachments of natural gas upon coal markets. While no one would care to minimize the inconvenience of having the coal industry's plans upset, there are nevertheless some actions that have to be taken by a regulatory agency for the good of a community, area or the country as a whole, regardless of how painful they may be to a particular industry or part of an industry. Any decision enabling expansion of the natural gas industry may cause some distress to coal and other fuel industries. But this is the price which must be paid for continued growth. And it is necessary to pay the price for the sake of the future as well as the present.

So the question facing the Commission in certificate cases is not whether some part of a fuel industry or industries is to be saved. Rather it is a question of whether the Commission, with knowledge of the contribution which natural gas has made to this country's progress, should continue to build for the future as well as the present. It need not heed the special interests that are most vocal on issues of this sort. What it must realize is that a vast host of consumers who had little or nothing to say on the subject at the hearing are depending upon it to raise its sights above narrow considerations to the major interest of the United States.

---

be protected and dependable markets assured. A continuation of higher field prices can only mean that pipeline companies and distributors will find their profit margins pinched between higher costs and consumer resistance to price increases.

The essential role of the Commission in this area of the natural gas business is to assure adequate service to the public and to protect consumers, not force or regulate them into using other fuels against their will. The coal industry, like any other industry, must face and solve every problem in its field. It must also recognize natural gas as one competitor among others and find its proper role in the total fuel supply picture. "The Natural Gas Act does not confer authority upon the Commission to promulgate a national fuels policy, or to assign 'zones of influence of operation' to natural gas or to any other fuels. The Commission's jurisdictional orbit is delineated by the requirements of public convenience and necessity." *Scranton-Spring Brook Water Co.*, 17 F.P.C. 25, 35; affirmed, 17 F.P.C. 38.

DEFENDANT'S EXHIBIT 4

THE UNITED ELECTRIC COAL COMPANIES
307 North Michigan Avenue
Chicago 1, Illinois

July 1, 1958

Mr. Frank Nugent, President
Freeman Coal Mining Corporation
300 West Washington Street
Chicago 6, Illinois

Dear Frank:

I spoke to you last night about an acreage of No. 9 seam coal controlled by Edwin Ruby and his associates in the Hopkins County Coal Company.

In 1954 he had Mr. Davis Read make a report on this acreage, copy of which I am enclosing, and after it has served your purpose, will you please return it to me.

At that time we were considering mining the No. 11 and No. 9 seams at the same time and using the washing plant to handle both coals on two shifts. However, the market was not such that we could justify two-shift production and the No. 11 seam strip coal controlled by Ruby will be exhausted in another year or eighteen months.

They are not underground people and hesitate to make the necessary investment to mine this underground coal. The tipple and washing plant, of course, is right on the property and could be purchased by anyone interested on a very reasonable basis. The reserves they control approximate six million tons and the cost estimate made by Mr. Read in 1954 would have to be revised to current wage rates.

We receive reports from the Kentucky Coal Agency on production and realization. For the calendar year 1957, washed No. 9 coal shows a realization of $3.5567 per ton. I am sure, however, that all companies did not report. The total reported shows 1,799,415 tons whereas the

total production of No. 9 washed coal, including Ken, DeKoven, Uniontown and West Kentucky Coal Company's properties, was about five million tons. The realization figure named, however, would be somewhat of a guide as to expectation as to return for the coal.

I thought you might be interested in looking over Mr. Read's report and later we might discuss it if the matter appears desirable.

Yours very truly,

/s/ J. M. Morris

EW

DEFENDANT'S EXHIBIT 5

July 11, 1958

Mr. F. F. Kolbe:

I am attaching a memorandum I asked Mr. Latimer to prepare on a *possible deep coal field in and around DuQuoin.* This field, marked in orange on the attached map, as far as we know has not been taken up. You can see from the drill holes on the north line of the Beaucoup field that the coal is running from 6½′ to 8′ in thickness.

Tom has explained in his letter what it might cost to pick up a field of this type, and I am wondering if we shouldn't give some consideration to adding to our reserves for at least the next five years. Five thousand acres would be carried for five years for $5,000 an acre.

This area, of course, is north and east of Pineyville and about north of DuQuoin.

/s/ R. J. Hepburn

RJH:J
Attach.

July 11th
1958

Mr. R. J. Hepburn

Deep Coal Reserves in Southern Illinois

As we are all aware, during the past few years practically all of the underground reserves of coal in a band several miles wide, from Belleville southeast to DuQuoin have been tied up by Peabody, Truax-Traer, Ayrshire and the Beaucoup Field. This coal is all tributary to the St. Louis & Belleville, M.P., O.M. & O. and I.C. railroads and the Kaskaskia, Big Muddy and Beaucoup canal projects.

Northeast, East and Southeast of DuQuoin, most of the known reserves of easily workable coal are also in the hands of operators with the exception of certain comparatively small blocks which are not too desirable for various reasons. There are few places left in this area tributary to the proposed canals, but immediately adjoining the Beaucoup Field on the North there is apparently a block of coal consisting of about 100 square miles of #6 coal unbroken by any known cutouts. Of course, only drilling can prove it, but there could easily be 640,000,000 tons in *Place* in this area, which is shown on the attached map.

This coal is rather sketchily proven by a line of drill holes across the North portion of the Beaucoup Field on the South. This line shows coal running from 5′ 1″ to 8′ in thickness, under from 172′ to 233′ of cover. The altitude of the coal seam varies from 251′ to 293′. At the Northwest corner of the tract at Nashville, the old Clemison mine operated in an average of about 6′ of coal at a depth of 407′, coal altitude 101′. At the Northeast corner at Ashley #3, 5′ thick was mined at a depth of 492′, coal altitude 52′. At Dubois, three miles North of the Southeast corner, coal over 6′ thick has been mined under 290′ of cover, coal altitude 223′. A cut-out runs across the North end of the block from Nashville to Ashley. The dip of the coal from South to North is quite gentle, perhaps in no case exceeding 25′ to the mile. Mining

conditions are, of course, not known definitely due to the lack of drilling, but should be fair to good.

Quality should be about the same as Fidelity.

A mine on the Southern edge of this field would be 8½ miles North of the Beaucoup canal at Pinekneyville, and a privately owned railroad would have to cross the M.R. and the I.C. Grades would be easy and favorable to the lands most of the distance, and a truck road could be built without any unusual expense.

I believe that a selected area within the above tract could be picked up on options to purchase at $50.00 per acre, or perhaps slightly higher in some cases. Paying $1.00 an acre at the time of signing the contract and a like amount each year for not over four years with the final payment coming due at the end of 5. Of course, the shorter the option period the easier it is to obtain contracts. Also, I think it would be well after some drilling has been done to buy a few of the difficult tracts at from $15.00 to $25.00 or $50.00 per acre. This has been done by some of our competitors with good results. Leases from 3¢ to 5¢ per ton will no doubt seem attractive to some of the land owners.

There is a small oil field along the Eastern portion of part of this field and all of those people will want to retain their oil rights.

I would also like to call attention to the Northwestern Railroad holdings over near Staunton on the O. H. & O. I have been told that this coal is not now on the market, but it might be, as it extends to Brighton which is about ten miles from the Illinois River, North of Alton. I do not believe a railroad would be practical to take this coal to the river because of the topography, although a route might be found where a belt line would be practical.

T. H. Latimer

THL/ah

DEFENDANT'S EXHIBIT 6

August 4, 1958

Mr. Justin Potter
Kentucky Store and Land Company
Crofton, Kentucky

Dear Jet:

I appreciate your desire to do something with the Buffalo Creek mine. However, we have so much money invested it it that we do not like to give it up until we have exhausted all our possibilities. In addition to drilling in the neighborhood, we are also trying to work out some machinery layout that would enable us to continue in business. All of these things involve a lot of thought, particularly as the property is so difficult that our solutions are apt to be unorthodox.

In regard to your property adjoining the Jenkins leases, we can not, of course, ask you to hold this until we are able to offer you a firm proposition on it, so it is all right with us for you to go ahead and make the best possible arrangement. I hope, however, that any arrangement you make will not be such as to hurt the property for some later more complete operation.

If you know of anyone who could operate our Buffalo Creek property and has the underground equipment to do it, we would be very willing to talk with them ourselves.

Incidentally, we believe that if a large investment at the present time is justified in Number Six coal, we and West Kentucky Coal Company could make a combined venture a profitable one. I have written to them about this but so far have not heard from them.

Very sincerely yours,

President

GENERAL DYNAMICS SEEKS TO ACQUIRE CHICAGO BUILDING SUPPLY FIRM

A WALL STREET JOURNAL *News Roundup*

General Dynamics Corp. is dickering to acquire Material Service Corp., a Chicago-based building supply and mining company.

Spokesmen for both concerns said that a possible merger of Material Service into General Dynamics has been under study for several months. They declined to forecast how soon a decision might be reached.

General Dynamics has been striving to build up its civilian business, and a merger with Material Service would mark its entry into the building supply field. General Dynamics is a leading maker of aircraft, submarines, missiles, and other defense products.

Material Service is controlled by Chicago industrialist Henry Crown, who owns the Empire State Building in New York and has varied other holdings. He is a vice president, director and member of the executive committee of Hilton Hotels Corp., as well as chairman of Material Service.

The Chicago company quarries limestone and produces sand, gravel, lime, concrete and aggregate, and mines coal. Its properties are located in Illinois, Indiana, Missouri and Utah. The concern also operates barges and towboats and holds about 25% interest in United Electric Coal Co.

Material Service earned $7,142,166, equal to $93.31 a share, on net sales of $103,405,938 in 1957. Its stock

is traded over-the-counter and it had 150 stockholders and 76,543 shares outstanding at the end of 1957. Assets at last December 31 totaled $81,457,415.

General Dynamics earned $44,278,763, or $4.80 a common share, on net sales of $1,562,538,900 in 1957. For the nine months ended September 30, the company earned $28,740,152, or $2.92 a common share, on consolidated sales of $1,153,498,834. Assets at last December 31 were $570,604,595.

"Should anything develop as a result of current discussions," General Dynamics said, "no change in personnel or conduct of business of Material Service Corp. is contemplated.

Management Consultant

December 11, 1958

Mr. F. F. Kolbe, President
United Electric Coal Company
307 North Michigan Avenue
Chicago, Illinois

Dear Mr. Kolbe:

The enclosed brochure on the Norris City, Illinois coal mining properties is submitted to you for the purpose of allowing your company to determine its interest in the purchase of the property.

This mine as well as the long term coal rights have been owned by my father for a number of years. He formerly owned a number of mines but has not been active in the mining business for many years. Because of his age it seems far more desirable for him to consider the sale of the property rather than to attempt to reopen the mine himself.

My father would consider a cash sale or an arrangement based on stock ownership in your company or possibly a minimum annual installment sale payment if it appears to be mutually advantageous.

I would appreciate your comments as to your company's potential interest in the acquisition of these extensive coal reserves.

Very truly yours,

/s/ Geo. Robert Boller

407 South Dearborn Street
Chicago 5, Illinois

Dear Mr. Boller:

As you requested on May 10, we are returning to you the brochure on Norris City, Illinois coal mining properties, which you submitted to Mr. Kolbe in December.

Mr. Kolbe has asked me to thank you very much for giving United Electric the opportunity to consider these properties, and to tell you that at this time our work is entirely in the strip mining field, so we have no present place for this kind of mining in our operations.

I regret that it has taken so long for me to locate this brochure for you.

Sincerely,

Secretary to Mr. Kolbe

Mr. Frank F. Kolbe, President
The United Electric Coal Companies
307 North Michigan Avenue
Chicago 1, Illinois

Dear Frank:

We have your proposed plan for Buffalo Creek, and it appears that the entire project revolves around the question as to whether or not you can maintain a price of $6.25 for #6 seam coal, and if that is possible, that your net earnings for the next ten years will range from $1.00 to $1.32 a ton. I question very much that a $6.25 realization can be maintained on #6 seam coal in face of a declining market for premium grade household stoker coal.

Yours very truly,

FREEMAN COAL MINING
CORPORATION
FRANK NUGENT

DEFENDANT'S EXHIBIT 11

May 27, 1959
(Dictated 5/26)

Mr. F. F. Kolbe:

Mr. Inman has given Mr. Utterback some figures on the *Industry field.*

We control a little over 3,000 acres, 2,500 of which are coal acres, giving us approximately nine million tons of coal. We feel that in our immediate area south and east of us there would be another 2,000 acres containing seven million tons. The ratio, however, would be from 30-35 to 1. We don't feel that this coal is continuous but somewhat like our present Buckheart field. I don't believe anyone will bother the tonnage in this area. However, with ratios of 35-40 to 1, I think this coal would run on southeast practically to Rushville. On the west and north a cutout appears which might be four or five miles in width, and the coal picks up again around Augusta.

We will explore this field to see what we can put together, but I do feel that we can figure on an additional seven million tons at our present location.

DESIGN AND CONSTRUCTION

October 2, 1959

Mr. Frank F. Kolbe, President
The United Electric Coal Companies
307 North Michigan Avenue
Chicago 1, Illinois

Dear Mr. Kolbe:

Before giving you our preliminary opinion in summary form on values of plant, equipment and recoverable coal reserves at active operations, also on values of recoverable coal reserves at inactive properties, we define what the values we assign to active properties represent.

The "value" of an active coal mine property, exclusive of salvage value, is that amount on which from the aggregate net cash generation (after-tax income plus depreciation plus sustained depletion less assumed cost of working capital less estimated necessary reinvestment in plant, equipment and coal reserves) there can be provided an adequate annual rate of interest return and have remaining from such net cash generation an amount which if invested at the end of each year to return the same adequate annual rate of interest will in the aggregate during the life of the recoverable coal reserves equal the "value". The salvage value to be added is the present worth of the estimated salvage value at the end of operations, discounted at the same adequate annual rate of interest.

Stated differently, we can consider the "value" to equal that principal amount of "borrowed money" that can be repaid with an adequate interest return out of the aggregate of net cash generation during the life of the recoverable coal reserves by applying the annual cash

generation at the end of each year, first, to interest on the unpaid balance of the principal and, second, to the reduction of the unpaid balance of the principal amount.

In estimating the after-tax income, no credit is taken for interest paid on borrowed money. The values are arrived at independently of the financing.

The "adequate" rate of interest return that we employ is ten percent annually. We believe that under present conditions and considering the risks inherent in coal mining, this is reasonable.

Unless otherwise noted, the assigned values are as of December 31, 1958.

ACTIVE MINES

Buckheart

Plant, Equipment and Coal Reserves, including Railroad and River Terminal	$7,042,490
Present worth of Estimated Salvage Value	158,272
	7,200,762
Depreciated book values 12/31/1958, Plant, Equipment and Coal Reserves	5,140,875
Appreciation	$2,059,887
Future stripping ratio 14:1	

Cuba

Plant, Equipment and Coal Reserves, including new Kolbe Wheel	$3,319,353
Present worth of Estimated Salvage Value	718,424
	4,037,777
Depreciated book values 12/31/1958, Plant, Equipment and Coal Reserves	1,259,111
New Kolbe Wheel	1,887,000
	$3,146,111
Appreciation	$ 891,666
Future stripping ratio 18:1	

Fidelity

Plant, Equipment and Coal Reserves	$3,966,819
Present worth of Estimated Salvage Value	46,150
	$4,012,969

Depreciated book values 12/31/1958, Plant, Equipment and Coal Reserves (including Clinch)	$4,016,765
Future stripping ratio 10:1	

Mary Moore

As of December 31, 1958 the estimated recoverable coal reserves were 538,000 tons. As of July 31, 1958 the depreciated investment in plant and equipment was $428,-927. As of December 31, 1958 this had decreased to approximately $393,534. The depleted investment in coal rights as of that date was $25,781. The cash generation from the remaining two years of operations subsequent to December 31, 1958 should be sufficient to extinguish the investment accounts, probably with a small overplus.

Plant, Equipment and Coal Reserves	$467,495
Present worth of Estimated Salvage Value	150,262
	617,757
Depreciated book value 12/31/1958, Plant Equipment and Coal Reserves	$419,315
Appreciation	$198,442

INACTIVE COAL RESERVES

The value of inactive coal reserves may be determined in one of several ways. If the quantity of contiguous recoverable coal reserves in an area is sufficient to provide for the development of a mine, the value is the present worth of the probable value per ton at time development fits into a planned schedule. United Electric has three such areas or fields, namely, North Canton, Glasford-Banner and Industry-McDonough County. We will consider these separately.

North Canton

The extent of this field, which is No. 6 coal with an estimated overburden ratio of 16:1, is substantial. As of December 31, 1958 United Electric owned in fee and/or held under contract an estimated 8,231,630 tons of re-

coverable coal. The acquisition cost is $1,185,368. This represents a per-ton cost of $0.1440. From our studies of results from Buckheart and Cuba, we have concluded that at these two active operations coal reserves have a present value of approximately $0.20 per ton. If these reserves are to be developed as a successor operation to Cuba some six or seven years hence, the carrying charges on $0.1440 per ton would increase the cost to an amount in excess of $0.20 per ton. There is a potential of 17,000,000 tons in addition to the reserves presently controlled in this field. The overall size is substantial.

In our opinion, the purchase price of $0.1440 per ton represents the value as of December 31, 1958.

Glasford-Banner

As of December 31, 1958 United Electric had purchase contracts covering an estimated 3,421,921 tons of recoverable coal in this field in which the total quantity recoverable from the two seams is estimated to approximate 17,000,000 tons. As of the same date an additional estimated 912,079 tons were held under lease. The coal from this field has an added value because the inherent quality is superior to that of Fulton County No. 5 and No. 6 coals. Additionally, the field is located along the Illinois River. The cleaned coal can be loaded into barges directly from the preparation plant. However, the two seams, one underlying the other, are thin and the overburden ratio is estimated to be 17:1.

We have studied the reports prepared by United Electric's staff, dated April 23, 1959. We note that the projected total costs are approximately equal to present total costs at Buckheart, Cuba and Fidelity. We note also that the projected sales realization is $5.27 per ton and, further, that the projected net after tax profit is $1.17 per ton. Such a profit represents in excess of a 40 percent return on invested capital. Also it represents in excess of 22 percent of the sales realization. The sales realization of Buckheart coal for the fiscal year 1959 was $4.45 per ton. This approximates the realization per ton f.o.b. barges.

The analyses of clean coal presented in the report show a moisture content that appears to us to be less than that of the inherent or bed moisture although no thermal drying is proposed for the projected preparation plant.

The production and marketing of this coal presents special problems. The projections in the staff report are, in our opinion, on the very optimistic side in spite of the several advantageous factors. Further, we would expect actual results to be closer to those at Buckheart than those projected.

Our opinion of the present value of the coal reserves owned in fee as of December 31, 1958 is $0.30 per ton. This assumes immediate development. The coal reserves leased at a royalty rate of $0.25 per ton have an overriding value of approximately $0.10 per ton at time of mining. The present value would be the $0.10 per ton discounted at 10 percent for the number of years that elapse until the leased coal is recovered.

Industry-McDonough County

As of December 31, 1958, United Electric owned in fee and held under purchase contract a total of 8,976,117 tons of strippable coal reserves in this field. The seam is the Illinois No. 2 with a thickness of approximately 28 inches. The stripping ratio on the reserves as of December 31, 1958 approximates 21:1. United Electric's engineers advise that there are an additional 7,000,000 tons available at a ratio of approximately 30:1. The consideration for the holdings was $597,250. This represents an average cost of $0.0665 per ton.

We are not informed on the probable time of development of this field. However, we do have a United Electric staff report dated July 1959 in which projections are made and estimates presented. These estimates are similar to those prepared for Glasford-Banner.

The two advantageous factors that prevail at Glasford-Banner are present in the Industry field but have a lesser value. These are the better quality of coal than that of Fulton County No. 5, although the quality is probably not as high as that of Glasford-Banner. The

location of the field is substantially further from the Illinois River than is Buckheart.

The adverse factor in this field is the stripping ratio of 25:1 and probably as much as 30:1. There are two fields in the tri-state district of Illinois-Indiana-West Kentucky in which stripping is carried on with a stripping ratio of approximately 20:1. One is in the thin coal fields of Northern Illinois and the other is in the Linton-Sullivan field in Indiana. The Northern Illinois operations are economically successful because of geographical location in respect to markets. Those in the Linton-Sullivan field are of a marginal nature. We are of the opinion that the development of the Industry field as of the present would be unprofitable. However, a decade hence the chances for a profitable development would be much improved.

In our opinion, the purchase price of $0.0665 per ton represents the value as of December 31, 1958.

Gayle and Clinch

We considered the Clinch coal reserves to be part of those assigned to Fidelity and their book value is included in the Fidelity book value.

United Electric has a substantial investment in the estimated 1,714,710 tons of recoverable coal reserves designated as Gayle. This is an isolated area with a probable stripping ratio of 9:1. Of the total reserves, 785,773 tons, the book value of which is $145,886, is owned in fee. This amounts to $0.186 per ton. The remainder of the reserves are leased at a royalty rate of $0.05 per ton. No special value attaches to the Gayle reserves. On the contrary, they have a lesser value than those at Fidelity because of the isolation. We are of the opinion that the present value of the total is $72,000.

Le Flore

The estimated 2,301,872 tons in this field were purchased for $45,125. Based on our familiarity with the Eastern Oklahoma area, we are of the opinion that the value is represented by the purchase price of $45,125.

The coal is not of metallurgical grade. The quantity of strippable coal available in the area is probably insufficient for an economical development.

West Kentucky

Included under this designation are coal reserves at Buffalo Creek No. 2, strip and underground, and underground reserves at Mine No. 21. Active operations have been and/or are being abandoned because of the limitations of existing uncovering equipment when working in a stripping ratio of 21:1. The coal reserves considered to be recoverable by stripping with suitable equipment are estimated to be 2,500,000 tons. The coal reserves recoverable by underground mining are estimated to be approximately 10,000,000 tons. Only approximately 4 percent of the total is owned in fee. The remainder is held under lease. The value of the holdings as of December 31, 1958 is nominal. The depreciated book value of plant and equipment at Mines Nos. 19 and 21 as of December 31, 1958 was $218,757. In our opinion, this amount represents a reasonable salvage value of plant and equipment.

Southern Illinois
Underground

These coal reserves formerly owned by Union Electric Company consist of an estimated 551,800 tons owned in fee and 4,562,380 tons held under lease. The value of these reserves is nominal.

SUMMARY

Our present effort is confined to giving you our considered opinion on value of major magnitude. Certainly there are miscellaneous items such as office furniture and equipment, automobiles used by administrative officers and salesmen, odd pieces of surface lands not connected with active operations, farm lands, etc. The total value of these is small in relation to the active properties.

We have built up a very considerable amount of data that has been used as the basis for our values. After you have reviewed this letter, we will be glad to discuss in detail any questions you may have.

Respectfully submitted,

/s/ Paul Weir

PW:L

DEFENDANT'S EXHIBIT 13

May 27th
1960

Mr. R. J. Hepburn

In regard to acquiring coal lands near our own property, I would like to point out to you two of our most serious past errors, of which you may not be completely aware.

In 1939 and 1940, George Campbell of Old Ben, had practically everything at Cuba north of Slug Run under option. This went far enough with them to thoroughly drill, survey, and stake out their railroad yard and tipple. The options were dropped even though they were extended for a few months. Our officials were only vaguely aware of this. When they were finally dropped, one of the land owners wrote in to us and asked us to come in. We did this despite the opposition of the then head of the operating department. Every ton we have mined at Cuba since January 1, 1946 and all we have left was either under option to them or blocked off from us. We also turned down the entire Morgan Coal Company field which they had required due to the stupidity of our then superintendent. All of this except a few thousand tons was under 40' or less of overburden.

In the 40's our lack of aggression placed us in trouble at Buckheart. Ayrshire came in and acquired 8,500,000 tons. We had been approached by two real estate men in Canton, Carver and Orendorff, who were working with John Organ who had drilled the area for [Illegible] Collieries. They wanted a $40,000 fee for taking up the options, and the total cost would have been $450,000.00. No contract was made and we made no serious attempt to secure options until after Ayrshire started working. Certain of these were dropped even then because of lack of solid coal. Among those drilled and dropped were Floyd Shelby, Fluke, Tendick, Woods, and Sharron McLouth. We were practically cut off from our holdings in the north area except for a right-of-way. We acquired the Orendorff property by out bidding Ayrshire. The

ownership in the field then made a settlement necessary. We acquired their 8,500,000 tons in 1948 for $1,800,000.00 plus royalty on one property. Had we not out bid them for Orendorff, we would not have had an operation north of the entrance road to the mine, with the exception of the Seebree and Spenny proportion and they would have acquired the rest of the north area.

Mr. E. C. Butler

August 23, 1960

Mr. C. Evans Parks, Vice President
Iowa Southern Utilities Company
Centerville, Iowa

Dear Mr. Parks:

It was very nice to have an opportunity of meeting you yesterday and we do appreciate the courtesy and consideration shown us. I wish you would convey our thanks to Mr. Shutts, Mr. Mann and Mr. McLeod.

First, I have started some investigation into the possibility of underground mining in line with your interest in this, as well as other utility buyers and the committee appointed by your Governor. I can readily realize the importance to the State of Iowa and to communities to develop this industry as a help to the economy of the State as well as utility companies operating in Iowa.

If it appears that underground mining is economically feasible, I am sure we would be interested, with our related company, as outlined in our conversation.

You asked me to send you some typical long-term contract agreements, which I am including herewith. These are listed as follows:

1. Standard Coal Contract
2. Agreement with Union Electric Company
3. Agreement with Commonwealth Edison Company
4. Agreement with Wisconsin Power and Light Company

No. 1 is a standard form developed by the National Purchasing Agents Association, various coal-buying executives and representatives of the coal industry. This is used except where some special situation exists and the Buyer prefers to have his own legal department draw up the contract.

No. 2 is an agreement between Union Electric Company, Buyer and Truax-Traer Coal Company and our com-

pany, Sellers. This one, I believe, is self-explanatory and a study of it will disclose the provisions for escalation, renegotiation and gross inequities that might develop over the period of the contract.

No. 3, as indicated, is an agreement with Commonwealth Edison Company and covers the required escalation provisions in a somewhat different manner than No. 2.

No. 4 is an agreement with Wisconsin Power and Light Company and again the escalation provision follows a somewhat different pattern.

Prices have been deleted, as we feel our customers would prefer that this information should only be disclosed by them.

You understand that these contracts cover coal that is being produced by mines that were already in existence and had been operating for some time. In other words, investments had been made, the acreage was available and we had the productive capacity already installed and were looking forward to a place to sell the coal.

In considering a completely new operation, we would of course want a backlog of tonnage assured before making the investment and I am sure that in discussion we could develop the type of contract that would be acceptable to both you, the Buyer and our company, the Seller.

We are particularly interested in providing a dependable source of supply at a fair price to you, having in mind that if underground mining does not prove feasible, sometime in the future—with the utility growth in your State—coal from Illinois may become attractive to you, particularly for a guaranteed, adequate source of supply.

We will continue our efforts to develop strip mining in Iowa in locations that could serve your plants and certainly will keep you informed of anything that we may find.

Thank you for your time and courtesy and I hope to see you again before too long.

With kindest regards,

Yours very truly,

JMM:MW

DEFENDANT'S EXHIBIT 15

September 7, 1960

Mr. H. L. Mann, President
Iowa Southern Utilities Company
Centerville, Iowa

Dear Mr. Mann:

I did not forget about our discussion concerning the Iowa coal situation when we had our visit the latter part of August.

You will recall I mentioned the close association between our Company and the Freeman Coal Mining Company, which is a Division of General Dynamics Corporation. We operate only strip mines and have no experience or organization familiar with underground mining. Freeman, however, is one of the most successful companies in the Midwest operating underground coal mines.

I know your interest in developing coal in Iowa if at all possible, and this probably would mean serious consideration of underground mining. I have discussed this with the President, Mr. Frank Nugent, of the Freeman Company.

Some years ago they made a study of some coal lands owned by the Rock Island Railroad and at that time decided the roof and other conditions made the proposition uninteresting to them. A lot of changes have occurred, of course, in the past few years in both underground and strip mining methods. Freeman would be glad to send one of their engineers out to look the field over again if you think it desirable.

I would be glad to hear from you in this regard and will be governed by your wishes in the matter.

We are still investigating the possibility of stripping some coal on a small scale, and as this progresses, I will be glad to report to you.

With kindest regards,

Yours very truly,

JMM:J

Mr. J. M. Morris, President
The United Electric Coal Companies
307 North Michigan Avenue
Chicago 1, Illinois

Dear Mr. Morris:

I have delayed answering your letter of September 9 to get some additional information.

Before your visit to Centerville we had tentatively arranged to have mining consultants examine the Centerville coal veins and give us a report on the possible investment and operating cost which would include the washing process. They were also to express their opinion on feasibility of mining this coal for the potential market.

I believe we could accomplish more in discussing this field with a representative of the Freeman Company after this report is available. The consultant will have their representative make his investigation the week of September 19 and we expect the report in our hands about October 1.

I will advise you when the report is available and we can then try to arrange a date for the representative of the Freeman Company to visit with us.

Sincerely yours,

/s/ H. L. Mann
President

MR. T. J. TARZY

November 15, 1961

Mr. H. L. Mann, President
Iowa Southern Utilities Company
Centerville, Iowa

Dear Mr. Mann:

As you know, since our meeting here in our office several months ago, the Freeman Coal Mining Corporation and our company have continued to investigate the possibility of a mine in Iowa.

Trying to put together enough acreage of strippable coal that could be mined economically seemed extremely difficult. Then we began to consider the possibility of a combination of strip and underground production.

At a meeting of the two companies today, it was decided to pursue this idea and I thought you would be interested in knowing that we are still hopeful that something can be accomplished.

We will assign people from both companies to do some more drilling and investigating and I hope that some time before too long, I can pay you a visit. In the meantime I wanted you to know we are still working on this matter.

With kindest regards,

Sincerely,

JHM:EW

Mr. J. N. Morris

Re: Preliminary Report
Sunshine Coal Property
Centerville, Iowa

While we still have to have another visit with Freeman for a final report on the underground and/or punch mining and stripping at Centerville, I thought I would give you a preliminary report.

Sunshine seems interested mostly when we talk about their property for power coal and also coal on their railroad. Keeping this in mind, there could be in this area nine to ten million tons of deep coal, of which approximately eight million would be deep mine and one million strippable. Part of this strip does not lie too far from the previous strip area that we looked at which contains 2 1/2 million tons of coal.

This report is based on information we have obtained from Sunshine and their merger drilling records.

All of these tons would have to be proven by new drilling. Our idea would be to do some drilling to first prove the tons and then further drilling to be able to properly mine it.

In the statement below where we say three million tons of finished coal could be put together in one location, this three million tons includes about one half million on which

we would have a two mile deadhead and the other 2 1/2 million is the drilled area we located previously. The 4,100,000-ton reserve mentioned in the last paragraph is without the stripping of approximately one million tons that are on the Sunshine property. These figures can all be cleaned up when we have a combined report.

SUNSHINE COAL COMPANY PROPERTY
NEAR CENTERVILLE, IOWA

During our recent visit to Centerville we concentrated on the properties controlled (deep reserve leases) by the Sunshine Coal Company. Sunshine controls some 2,830 acres and can obtain an additional 760 acres. Their drilling in the area went from 10 feet of cover to 154 feet; however, the locations of these drillings were not definite enough for strip purposes. The main impression obtained from drilling was the fact that this coal dips from the outcrop in something like 4% - that is, 40 feet down per 1,000 foot horizontal distance. Assuming that the hills rise at 3% grade, the overburden depth will increase 40 feet some 550 feet from the edge of the hills, meaning that with little or no bottom land our contour stripping will progress some 500 to 600 feet into the hillside. At this point stripping with a shovel approaches the economical limit and punch mining will begin.

The Sunshine property supposedly has outcrops on the south side about 1-1/3 miles long and on the north 1 mile long - this being adjacent to some 4-1/2 miles of outcrop located by United's previous drilling in the area. The south outcrop is some 2 to 2-1/2 miles from the main or north outcrop. With additional drilling and using what areas were previously considered with the Sunshine property, about 3,000,000 tons of finished coal could be put together in one location. To prove this immediate area for stripping would require 100 to 150 drill holes at a cost of about $7,500 to $10,000. Any additional areas of drilling would be an added cost.

We have considered three different types of stripping equipment: a 6-yard dragline, a 18-yard dragline, and a 35-yard shovel. The following is a breakdown of the production that could be expected from these machines at 40 feet of cover.

	6-Yard Dragline	12-Yard Dragline	35-Yard Shovel
Monthly Production - Yards	100,000	250,000	760,000
Ratio	18.5	18.5	18.5
Monthly Production - Tons	5,400	13,500	41,200**
Yearly Production - Tons	61,000	159,000	465,000
Daily Production - Tons (200 days/year)	305	765	2,320
Estimated Cost per Ton	$4.06*	$4.06	$3.25

* This cost could be 25¢ to 50¢ low due to the low production.

** This tonnage could be reduced to 29,000 tons on a 5-day week, or 330,000 tons yearly, if so required.

Another possibility for this field would be to open the outcrop strictly for punch mining with a 6-yard dragline. This cost would be approximately $2.80 a ton. This would necessitate a small machine to enable a productive punch mining operation to fulfill the demand requirements. United would produce in this (Sunshine) area approximately a total of 100,000 tons, and due to low cover at outcrop the machine is capable of doing this work in ten months on a 24-hour, 7-day week.

At this point I think it should be pointed out that of the Sunshine property (2,830+760) 3,590 acres controlled for deep mining, we will by strip and punch mining recover only approximately 1/2 of the total coal reserves.

Relative to the punch mining by Freeman Coal, it is being considered presently on a 1/2 mile penetration with a recovery or yield similar to the stripping operation which, adhering to the Sunshine property, would have a reserve of 2,800,000 tons, and if the adjacent area was included, an additional 1,300,000 tons could be mined for a total of 4,100,000 tons reserve. Mr. C. Sanford (Freeman) stated that one unit would produce about 250 tons per shift, or 500 tons on a 2-shift operation, or 100,000 tons yearly.

DEFENDANT'S EXHIBIT 19

IOWA SOUTHERN UTILITIES COMPANY

300 SHERIDAN AVENUE, CENTERVILLE, IOWA

OFFICE OF THE CHAIRMAN

November 30, 1962

Mr. Robert J. Hepburn, Vice President
The United Electric Coal Companies
307 North Michigan Avenue
Chicago 1, Illinois

Dear Mr. Hepburn:

We have been studying our coal situation. There has been delay because there are a number of developments that had to be looked into. Our study indicates we have very little concern about an adequate coal supply for at least five years. Some of our people think ten years' supply for present operations will be available. The other companies in our area think a good supply of interruptible gas will be available for a long time in the future. Delay in getting agreement on Iowa Power Pool ultimate plan makes the future market for coal uncertain.

With the reasonably assured supply, our study indicates we would raise our fuel cost over an extended period before we would need a ten-year reserve contract.

Our present cost average is $4.31 f.o.b. Bridgeport with $1.14 freight rate. We have an average Btu value on our purchases of raw coal of 9,700. This makes our f.o.b. Bridgeport cost 22.2¢ per million Btu.

A $4.70 f.o.b. Bridgeport price would raise our cost per million Btu to 24.2¢ and increase our annual cost for 150,000 tons by $58,500.

A $5.00 per ton f.o.b. Bridgeport price would increase our cost, based on 9,700 Btu raw coal, to 25.8¢ per million and our annual cost on 150,000 tons would go up $104,000 annually.

In view of the study results indicating no immediate shortage of supply, we can't justify costs above our 22.2¢ per million f.o.b. Bridgeport at this time.

The recent developments and uncertain future market would indicate that we should not, at this time, expect your company to develop the Appanoose County coal field at the prices we feel we can afford.

We will be glad to discuss this whole matter with you if you care to pursue it further.

Mr. Mann has not been able to hire the kind of person he wants to help him so the lease project has not progressed.

Sincerely yours,

HLM:MH

H. L. Mann

Mr. H. L. Mann, Chairman
Iowa Southern Utilities Company
300 Sheridan Avenue
Centerville, Iowa

Dear Mr. Mann:

I wish to acknowledge your letter of November 30. I would have answered you a little sooner but I have been out of the office.

I was deeply concerned about the thought of a good supply of interruptible gas becoming available in your area. While we had talked about this in the past, you did not show much thought that this would be available in quantities sufficient for your power supply. Of course, we do not feel that we could mine coal in this area and compete with gas costs.

It possibly is true that you will have a coal supply for five to ten years. No doubt it will be a little hard at this time to estimate the exact price per ton, or cost per million B.T.U.'s. However, we are interested in this area and feel that we should again pick up more options and do some drilling so that we can determine a cost figure. If under these conditions you feel that you could favor us with coal business if we can be on a competitive basis with other coal prices, we still would like to go ahead with our drilling program and our optioning program with Mr. Ham. If you could indicate that we could be favored with business if we are competitive on this basis, we would like to complete our investigation.

If necessary, we will be glad to come out and visit with you, but perhaps this letter will get us closer together again.

Very truly yours,

Vice President

Mr. Frank Nugent, President
Freeman Coal Mining Corporation
A Division of General Dynamics Corporation
300 West Washington Street
Chicago 6, Illinois

Dear Frank:

Enclosed is draft of letter to Arch Kraakevik of Illinois Power concerning our present contract on Mary Moore coal for delivery to their Danville station.

Before I send this out, will you please look it over and let me know if it has your approval.

Yours very truly,

THE UNITED ELECTRIC COAL COMPANIES
307 North Michigan Avenue
Chicago, Illinois 60601

DRAFT

Mr. A. Kraakevik, Vice President
Illinois Power Company
500 South 27th Street
Decatur, Illinois

Dear Arch:

This will confirm conversation with you in your office on Friday, May 15, concerning coal contract under which we are now shipping from our Mary Moore Mine to your Vermilion Station near Danville, Illinois.

The present contract became effective July 16, 1962, with an expiration date of July 15, 1966. This provided for delivery of 960,000 tons, plus or minus 10%. It was

expected that the land acquired by us would yield about this much tonnage and would be mined out about the approximate date of the contract indicated above. We now know that due to certain unforeseen conditions, at our current rate of production, all of the coal in the present working area will be exhausted by the end of December of this year. As of that date, the contract will still have about eighteen months to go and we will be short approximately 250,000 tons under the amount anticipated in the original agreement.

To fill out this tonnage and time under the present agreement, we propose to supply coal from the Freeman Coal Mining Corporation's Orient No. 5 Mine. This will be raw mine run crushed to a 3" top size through a Bradford breaker, and will analyze approximately 11,100 BTU as received and 15% ash on a dry basis.

The present delivered cost per million BTU's on the Mary Moore coal prior to the effect of the changed labor scale on April 2, 1964 was 21.51¢. The Freeman coal would be delivered to you on this basis, plus the amount per ton finally agreed upon under the escalation clause covering the change in the UMWA contract.

This will protect you, both as to tonnage and price, for the balance of the contract period, and during that time we will continue to inform you of any coal lands that we may acquire in the Danville area which would provide any additional tonnage in that field. We understand, however, that we are to make no land acquisitions without consultation with you as to any future mining for delivery of coal to you.

I understand the above has your approval and we have asked Freeman to confirm the arrangement by letter to you.

Yours very truly,

J. M. Morris

June 11, 1964

Frank:

Enclosed is a very rough draft of the highlights of last year, which might serve as a guide for what we will say in our Annual Report.

Copy of the Mined-Land Conservation Conference brochure is also enclosed for your information. You will note we are given considerable recognition in the last three or four pages.

After you have looked this over, we can talk about it.

JMM

DRAFT

REVIEW OF THE YEAR

Sales of the Company were the highest on record - $_____ - an increase of 10% (?) over last year. Net income was $_____, an increase over our previous year of 12% (?).

At the end of our fiscal year 1963, bank loans amounted to $1,708,199 and all of this was retired during the year ended July 31, 1964.

The dividend rate of $1.80 per share annually was continued throughout the past year.

Capital Additions

A new heat dryer was installed at the Fidelity Mine and started operating in January of 1964. This dryer removes the excess moisture from the washed coal, increasing the BTU value and avoiding the extreme difficulties of frozen coal in severe winter weather. Prior to the installation of this dryer, our shipments were seriously curtailed during extremely low temperatures and this will now be avoided. The dryer has performed in a very satisfactory manner and completely in accord with our expectations.

We purchased during the past fiscal year two 100-ton haulage trucks to replace worn-out units and this program will be continued as replacement is necessary. The largest trucks we had in use prior to this time were of 50-ton capacity, with some smaller units. We expect greater production and some reduction in our haulage costs as these larger units are put in service.

Sometime during the next eighteen months, it will be necessary to move some heavy equipment to a new location at the Cuba Mine, which will involve considerable expense. Also the acreage we are now working at the Mary Moore Mine will be exhausted. This will involve expense in moving the equipment. Mary Moore has been a small producing property and this will not reflect any substantial reduction in earnings.

No other large capital expenditures, except for normal replacement of equipment and for additional coal deposits, are contemplated during the next fiscal year.

Production and Consumption

Tables, with reference to increase in utility consumption, which can be accounted for by one of our larger utility customers.

Coal Deposits

Organization Changes

None ????

General Dynamics Corporation now owns _____ shares, or __% of the outstanding common stock of the Company.

Change in Fiscal Year

For some time it has appeared desirable to change our fiscal year end from July 31 to December 31. This will make it easier to compare results of the Company with those of other coal producers and industries. Approval of the change was authorized by the Board of Directors during the fiscal year. The interim statement for the five-months period ending December 31, 1964 will be sent to our shareholders and also incorporated in our Annual Report for the calendar year 1965, which also will be our fiscal year.

DRAFT

PRESIDENT'S LETTER TO SHAREHOLDERS

As you will see from the following pages, 1964 was a very good year for your Company. Unusually favorable weather and good operating conditions at all of our mining properties contributed substantially to the results. Increased sales to our customers, particularly one of our larger utility users, made it possible to produce a record 5, , tons. More complete details of the year's accomplishments are described under "Review of the Year".

We continue wherever possible to reclaim land which has been mined and put it to the use for which it is best adapted. Pictures in this report show some of the recreational facilities that have been established and are being used. Most of the responsible strip coal mine operators are doing this. The enclosed brochure produced by the Mined-Land Conservation Conference shows the variety and extent of activities in this direction in many States. Our Company is a member of the Conference and contributes both time and money as well as the talents of our organization to its work.

All of our properties are currently producing close to capacity and we continue to view with optimism the future of the coal industry.

We have always had the sincere and full cooperation of our entire organization and we are grateful to our shareholders, members of the Board of Directors and all employees for their interest and efforts on behalf of the Company.

DEFENDANT'S EXHIBIT 24

June 29, 1965

MR. T. J. TARZY
MR. J. T. MURRAY
MR. R. H. INMAN

In reviewing our property in the Industry field, we apparently have about $845,000 already paid, with remaining liability on purchase contracts of $56,500. All of this land is owned in fee and the average cost per acre is approximately $170. Assuming the tonnage is there according to our drilling, this represents $0.061 per ton.

Our farming apparently is not very productive. Taxes are charged against the farming and last year we lost on farming about $1,000 more than the taxes on the land.

The value of this coal field is certainly more doubtful than it was when we acquired it, with the changes that have developed in transportation, particularly unit trains.

Possibly we should all give this some thought and sometime soon get together and see if anything should be done about it.

Mr. Frank Nugent, President
Freeman Coal Mining Corporation
A Division of General Dynamics Corporation
300 West Washington Street
Chicago, Illinois 60606

Dear Frank:

No doubt you kept a copy of report prepared by your Mr. J. H. Matheson, Jr. on cost estimates to try out underground mining at Fidelity. Estimates were as follows on total cost in trucks in the Fidelity pit:

300 Tons per Shift	$3.077
400 Tons per Shift	$2.610
500 Tons per Shift	$2.325

The attached sheet shows costs accrued in trucks in the pit for the periods indicated.

Our fiscal year ended July 31, 1964 was the best in the history of the Company and Fidelity Mine was in very good stripping and operating conditions and achieved a cost of $1.54 for that period. For the period beginning August 1, 1964 and ended December 31, 1964, you will notice a sharp increase in our total stripping cost from 67.1¢ to 89.0¢, and for the nine months ended September 30, 1965, we again went up sharply due to opening the new Green pit, increase in drilling and blasting, and the necessity for operating two machines while we were developing this new pit.

I think a fair estimate of total cost in trucks is probably around $1.80 and this compares with the underground estimate, if we assume a middle-of-the-road basis of 400 tons per shift, of $2.61 in truck. It would appear that a difference of 80¢ per ton is too much to justify trying this method.

We can discuss this further sometime at your convenience.

Yours very truly,

JHM:ES

March 14, 1955

Mr. Frank Bryant
Boca Raton Hotel & Club
Boca Raton, Florida

Dear Frank:

I will see you next week but in the meantime wanted to bring you up to date on the No. 9 seam underground coal near Clay, Kentucky, about which I have given you some information.

Joe Davis, who owns this, is now in a frame of mind to discuss turning it over to some company like Freeman for a future mine on the property. In the meantime two oil companies have entered the scene and are making a determined effort to get control of the reserves. He realizes, however, that this is a long-range proposition and probably will not mean a coal mine in the foreseeable future.

He also is still discussing with both Georgia and Alabama Power a long-term contract but has not as yet been able to get the kind of freight rate on a volume basis that appears necessary.

The TVA has a bid opening on March 29 and he may put in a price on this. He is talking in terms of $3.60 f.o.b. mine for raw No. 9 mine run, on which I am sure he can safely guarantee 11,900. This would be somewhat near recent award made to Bell & Zoller and might result in a contract. If he did get a contract, I think he would still be willing to discuss leasing the coal rights to someone else to operate.

I told him we were somewhat interested but it would take time to investigate and we would not commit ourselves until a thorough investigation and discussion could be had.

I will talk to you more about it when I see you.

Yours very truly,

JHM:RF

DEFENDANT'S EXHIBIT 29

July 13th
1966

Mr. R. H. Inman

Beginning next week we will be drilling in the Medicine Bow Field. Previously, with the preliminary drilling we had on the Greer Boylan property and the Planters State Bank property, Burl had estimated a possibility of around 15,000,000 tons of strippable coal, that is, under a 100' overburden in this area for the one major seam only. With this potential, our plans are to drill the property we have at this time on a 660 grid basis to prove out as much of this estimate as property we control.

Burl tells me at one time he believes that Bill Roope had received verbal approval from someone with Colorado Fuel and Iron for us to drill their property in this area. Some of the Colorado Fuel & Iron lies between our tracts and adjacent to the Planters State Bank property. If we could confirm such an agreement right away it would be possible for us to drill the Colorado Fuel & Iron property on this trip.

July 29, 1966

Mr. T. H. Latimer
Mr. D. H. Emling

We promised Mr. George Heap of Sullivan, Indiana, who brought the area surrounding the Du Quoin reservoir to our attention again, that we would be in touch with him this week or next.

As Mr. Latimer already knows, we have considered the coal acreages up here previously. Mr. Heap pointed out that this could entail twenty-five million tons. However, I beg to differ with him as we have recently reviewed our Du Quoin operation and at this time consider a ratio of 16-17 to one as our stripping limit in this location. The thickness of this coal is at least a foot thinner than we are presently mining at the Du Quoin mine. Therefore, this ratio would be in the area of 65-70 ft. of overburden.

As we promised this man some word this week or the first of next, please review this as soon as possible and advise.

Mr. R. H. Inman

STAR LAKE FIELD

McKinley County, New Mexico

In this field there are three state sections which must be ruled on at the August 12, 1966 Board Meeting. As we are interested in prospecting this area further we should keep Permit Nos. M-14728 (641.39 acres) and M-14730 (636.64 acres).

These prospecting permits are for only one year, therefore, we must apply for a state coal lease. The first year coal lease payment would be a minimum annual rental of $25.00 plus an advance royalty payment of $3.00/acre, giving a total cost of $3,884.09 for both sections. The second year advance is at the rate of $4.00 per acre and each year thereafter is at $5.00 per acre rate.

There is a coal washout on permit #14730. Our drill spacing is not close enough to exactly define the washout area, but we feel we can reasonably reduce the lease acreage to 400 acres and still tie up most of the coal on this section. This would reduce the total payment to $3,174.17.

State Permit M-14729 (640 acres) is probably underlain by thick coal, but the overburden is greater than 100'. As the reserves are not strippable this section should be dropped. Total cost on the section would be $1,945.00.

Attached are estimate sheets covering these sections.

Dear Frank:

I am sending you herewith copy of inquiry from the Resources Company, which you will find more or less self-explanatory.

It is designed to provide coal from a field controlled by the Resources Company in Utah for a power plant to be built by three utilities, including Southern California Edison. They apparently want somebody to mine the coal for them and the enclosed outlines a proposal they want.

As this is underground coal, I am sending it to you for whatever action you see fit to take.

Yours very truly,

/s/ John
JOHN

JMM:EW

DEFENDANT'S EXHIBIT 33

October 18, 1966

Mr. T. H. Latimer:

In regard to Mr. George E. Heap's proposition on the Sunfield area, which is mainly around the city of Du Quoin's water supply lake, our geologist estimates approximately 12¼ million tons of coal under 80 ft. of overburden. The better stripping is under the lake, and 3⅓ million tons is presently under water.

There are approximately 117 houses surrounding this lake. Seven of these homes are in the $15,000 to $25,000 bracket, either on purchased land or land leased from the city of Du Quoin. One hundred ten houses are worth from $2,000 to $5,000 each.

Mr. Heap's proposal is that he would require a 3¢ per ton royalty on coal up to a depth of 100 ft. Because of the thickness of this coal and the amount of rock in the overburden, we question whether 100 ft. is economically strippable. This coal is approximately 5 ft., which is about one foot less than we presently are mining at the Fidelity mine. Mr. Heap desires 75% advance royalty on the estimated tonnage and a payment of $12,000 initially and $12,000 annually until mining starts.

The first problem to be resolved is, what is the estimated tonnage. Mr. Heap is estimating 25 million, we estimate considerably less. Mr. Heap presently has one option to purchase in this area of 480 acres. Before we pay Mr. Heap 75% advance royalty, United or Mr. Heap should control 75% of the property that is agreed upon as being strippable. An agreement possibly could be made up giving Mr. Heap a certain period of time to acquire in his name the other properties that would eventually be transferred to United. The agreement should also include, after this period of time, United's right of first refusal. We possibly could pay Mr. Heap's expenses and cost during the time he is endeavoring to acquire these properties.

As you know, I am not very optimistic about this field. I do not feel that anyone except United or Truax-Traer will mine the area because of the size.

If Mr. Heap desires to talk on these terms, we will be glad to meet with him and discuss the matter more thoroughly.

We are, of course, very much concerned about the lake and the drainage into this lake. We question whether the city of Du Quoin would allow a coal company to mine this property by strip methods, and with the number of houses on the lake, the cost may be prohibitive.

DEFENDANT'S EXHIBIT 34

ILLINOIS STATE GEOLOGICAL SURVEY

Natural Resources Building
Urbana, Illinois 61801

July 31, 1967

Mr. Frank Nugent, President
Freeman Coal Mining Corp.
307 North Michigan Avenue
Chicago, Illinois

Dear Mr. Nugent:

The following is written in response to our recent conversations concerning our series of reports entitled "Strippable Coal Reserves of Illinois" and the general status of strippable coal reserves in the State.

As you have indicated, correctly, the prime objectives of this study have been to develop all available data to suggest little or unknown areas where such reserves might exist and to determine an "estimate of reserves." Several significant points spelled out in the text of this series of reports are reviewed for you here.

1. Minimum coal thickness considered is 18 inches.
2. Maximum overburden thickness considered is 150 feet.
3. 1800 tons per acre foot was used in calculations, in order to be in conformity with U. S. Geological Survey standards. As our coals largely fall in the lower range of the high volatile coals, we have felt that 1770 tons per acre foot might be more representative.
4. No exclusions have been made for surface features that would render mining impractical, such as towns, railroads, highways, etc. These exclusions were not made because it was not practical on the scale of our mapping and with much data not readily at hand to make any such exclusions consistently. No evaluations have been made of mining conditions or coal quality.

5. "Reserve" figures represent total coal remaining in the ground as of the date of each study, and no attempt has been made to estimate "recoverable" reserves.

We cannot assess economic feasibility for strip mining as this is strictly an industry matter that varies from day to day and even may have variable response from different companies at the same time. It should be emphasized, however, that the estimates for total coal in the ground are reported in such a way that current economic conditions in any particular area can be assessed relative to factors reported in these studies. Overburden categories of 50, 100, and 150 feet, and average thickness, generally in one foot increments, permit the reader to put thickness and overburden limits within his own current definition. It is a serious mistake to use merely total values as published without considering the definitions.

As you well know, we have maintained very close working relationships with *all* major coal companies in the State and have rendered assistance in locating possible new reserves for many years. As of about 15 years ago, although the coal industry of the State was much depressed, a high level of activity in locating strippable coal reserves remained and has continued in the years since. A somewhat comparable scramble for new underground reserves has developed in the last several years.

So intense has been the interest in the more favorably situated strippable reserves, that I do not know of any prime acreage that is not now under control. We continue to hope from our studies that additional prime reserves may be discovered in areas not now proved, but know that the more promising areas that were previously little known have been tested.

Concerning your inquiry about Indiana and Kentucky strippable coal, I am not as intimately familiar with these areas as with Illinois, but know that the same general picture holds for these areas (as it does for other coal areas east of the Mississippi River, I am sure).

We certainly agree that no economic factors are evaluated by our studies. Further, although significant reserves are held by several companies, we cannot now specifically designate any area where coal under con-

ditions generally being mined at present are available, other than lands under control. It has been our sincere hope that in the use of our reports that the limitations and objectives would be appreciated by the users.

If I may provide any further information, please do not hesitate to let me know.

Sincerely yours,

/s/ Jack A. Simon

STANDARD COAL CONTRACT

THIS AGREEMENT subject to the terms and conditions printed on the reverse side hereof, 35

30th day of September, 19 68, between THE UNITED ELECTRIC COAL COMPANIES, 307 North Michigan Avenue, Chicago 1, Illinois, hereinafter referred to as Seller, and CENTRAL ILLINOIS LIGHT COMPANY of Peoria, Illinois hereinafter referred to as Buyer, is as follows:

Seller hereby agrees to sell and deliver, and Buyer hereby agrees to purchase and accept, between the 1st day of January, 19 73, and the 31st day of December, 19 91, the quantity and kind of coal and at the price and on the terms and conditions hereinafter stated, to-wit:

QUANTITY One million tons per year (plus or minus 10%).

RATE OF SHIPMENT (approximately) Approximately equal monthly quantities.

DESCRIPTION: Coal under this contract shall be Fulton County, Illinois, No. 5 and No. 6 seam Washed 1-1/4" Screenings (see attached Supplement

produced at the Buckheart Mine of Seller.

PRICE $4.25 per net ton f.o.b. mine, exclusive of any sales, occupational, or use taxes. See attached Supplement which is hereby made a part of this Contract.

TO BE SHIPPED TO Buyer.

DESTINATION Generating Stations as designated by Buyer.

USE: Coal shipped hereunder to be used for boiler fuel by Buyer in its plants at various plants.

ROUTING As specified by Buyer TRANSPORTATION EQUIPMENT As specified.

TERMS OF PAYMENT Net cash on or before 10th day of each month for all coal shipped during preceding calendar month.

(All payments are payable in United States Currency at Buyer's principal office.)

IN WITNESS WHEREOF the parties hereto have caused this agreement to be executed in quadruplicate by their respective officers duly authorized the day and year first above written.

CENTRAL ILLINOIS LIGHT COMPANY
BUYER

Peoria, Illinois 61630

September 5, 1969

Mr. Reuben L. Hedlund
Kirkland, Ellis, Hodson, Chaffety & Masters
Prudential Plaza
Chicago, Illinois 60601

Dear Mr. Hedlund:

The results of five feasibility studies made on the use of coal versus gas for fuel are as follows:

1. East Peoria Plant -- study made in 1967 by an oil supplier indicated a higher cost for natural gas and/or oil. Decision was to continue using coal for fuel.

2. East Peoria Plant -- study made in 1965 on the use of natural gas for producing steam indicated that the use of natural gas would result in increased fuel costs. Decision was to continue using coal for fuel.

3. Aurora Plant -- study made in 1965 on the use of natural gas for two new buildings resulted in the purchase of two natural gas fired steam boilers to supply heat for process and building heat.

4. Mapleton Plant -- study made in 1965 resulted in the purchase of gas-fired make-up air units. No coal is used at the Mapleton Plant.

5. Mossville Plant -- study made in 1966 resulted in the purchase of a 125,000#/hr. gas-fired boiler to supplement the two 80,000#/hr. coal-fired boilers.

Sincerely,

DEFENDANT'S EXHIBIT 37

60-0-37-920

September 12, 1969

BY MESSENGER

Reuben L. Hedlund, Esq.
Kirkland, Ellis, Hodson,
Chaffetz & Masters
Prudential Plaza
Chicago, Illinois 60601

Dear Mr. Hedlund:

By letter dated September 8, 1969, you requested information concerning the sale by Peabody Coal Company of a new coal company (which Peabody refers to as the "Midland Division") which is required by Paragraph VII of the Final Judgment in United States v. Peabody Coal Company et al., dated October 23, 1967.

Your first request is for a list of the companies approved by the Government as eligible potential purchasers of the Midland Division from those firms which had expressed an interest in the properties to be divested by Peabody. On July 2, 1969, we advised counsel for Peabody Coal Company what our views were at that time with respect to the following prospective purchasers:

Group 1. No objection - subject to receipt of satisfactory financial information:

Alberta Coal Ltd.
New Era Corporation
Sherwood-Templeton Coal Co. Inc.
H. E. Drummond Coal Co. Inc.

Group 2. No objection:

Cerro Corporation
Utah Construction & Mining Co.
The Cleveland-Cliffs Iron Co.
Ziegler Coal & Coke Company

Group 3. Reserved:

Panhandle Eastern Pipe Line Company
Pickands Mather & Co.
Cities Service Oil Company
The LaSalle Corp. (Henry Crown & Co.)
Great Lakes Carbon Corp.
American Smelting and Refining Co.
Ashland Oil & Refining Co.

Group 4. Unacceptable:

Pittsburg & Midway Coal Mining Co.
The North American Coal Corp.

Your second request asks for the total tons of recoverable coal reserves assigned to each of the Midland Division's three mines, whether owned or controlled by location. Peabody Coal Company has represented that the total available coal reserves owned, leased, under option or controlled by location for each mine are as follows:

Elm, approximately 65,000,000 tons.
Mecco, approximately 55,000,000 tons.
Allandale, approximately 8,500,000 tons.

As you are aware, coal reserves "controlled by location" refer to coal reserves in the vicinity of a mine which reserves are owned by third parties and which reserves may be acquired in the future.

Your third request calls for the expected life of the three mines.

Paragraph VII of the Final Judgment requires the sale of a coal company producing and selling 6,000,000 tons of coal each year that shall have or shall reasonably be expected to be able to obtain sufficient coal reserves for continued production and sale of bituminous coal of not less than 6,000,000 tons each year for 20 years. Peabody Coal Company offers to sell the above described mines to comply with the Final Judgment.

Your fourth request asks for the present time schedule for the submission of bids from potential purchasers of Midland and the contemplated date of sale. The Final Judgment requires Peabody Coal Company to sell the coal business to a purchaser approved by the United States or by the sale of stock to the public through an underwriter on or before October 23, 1969. It is our understanding that Peabody Coal Company has invited bids to be submitted on or before September 15, 1969.

I hope that this information will be helpful to you in formulating a settlement proposal.

Sincerely yours,

RICHARD W. McLAREN
Assistant Attorney General

DX 38 Zeigler Coal & Coke Company and Subsidiaries

1965 Annual Report

* * *

TO OUR SHAREHOLDERS

Results of operations for 1965 are submitted in detail in this report for the year. In the major categories, such as total production, sales and net income, our 1965 figures were approximately the same as for the preceding year. Apart from normal coal operations, the past year will be considered noteworthy for the reason that negotiations were completed for the sale of natural gas from your Company's West Kentucky properties. Also, your Company, during the past year, was the successful bidder for a large coal contract with the Tennessee Valley Authority. Dividends totalling $1 per share were paid during the year.

Concerning 1966, we have every confidence of an improvement in earnings.

Production, Sales, Net Income

Production of coal in 1965 amounted to 4,468,371 tons. Net sales in the year 1965 totalled $17,600,334.

Both production and net sales were slightly improved over that of 1964.

Net income for 1965 after taxes amounted to $1,024,622 as compared with $1,009,603 in 1964. The 1965 net income was equal to $2.14 per share as compared with $2.12 per share in 1964.

Coal Operations

Operations of our mines were at a satisfactory level in 1965 with the exception of our Zeigler No. 3 mine. This latter property continued to present us with serious operating difficulties. Our earnings for the year would have been materially improved if we had been able to operate this mine without a loss. In spite of the difficulties, we are still hopeful that our

problems can be successfully solved so as to make this mine a more satisfactory operating venture. It is not an easy decision to close a mine and leave millions of tons of coal unmined. We will avoid such action if it is at all possible, although it is not our intention to continue to operate the mine if our mining problems cannot be resolved.

TVA Contract

A major event of the year and a significant development in the current history of the Company was the coal contract award received in October from the Tennessee Valley Authority. The award, largest in the history of Zeigler and its subsidiary, Bell & Zoller, involves a total of 26,000,000 tons of coal to be delivered over a 15-year period.

At the time of the announcement of the award, a letter to shareholders notifying them of this development said: "We expect the revenues from the award to contribute satisfactorily to earnings of the Company over the life of the contract."

To fill requirements of the contract necessitates our opening a new mine on our Hopkins County, West Kentucky, properties. The fact that your Company owns substantial reserves of coal in that area was a consideration in the award decision made by the TVA authorities. The operation of the mine will be featured by the use of the most modern high-capacity production machinery and equipment available for the underground mining of this seam.

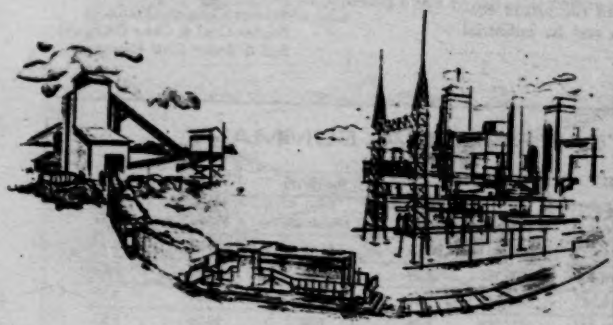
Natural Gas

Delivery of natural gas from your Company's West Kentucky wells to the line of Texas Gas Transmission Company began on December 17, 1965, shortly after temporary permission for such sale was forthcoming from the Federal Power Commission. The actual introduction of this fuel into the distribution channels of Texas Gas grew out of a gas purchase contract entered into with that Company. Stockholders were advised of this event by letter dated November 9.

As pointed out in that letter, the contract with the transmission company provides for the sale to them of a minimum of 4,200,000 cubic feet daily at a price of 17 cents for each 1,000 cubic feet, with the contract extending over a 20-year period. Texas Gas, under an option, can purchase at 15 cents per 1,000 cubic feet all of the gas in place at any time during the first 12 years of the contract.

Land Reclamation

Your Company is engaging in a program to develop several thousand acres of land owned in Franklin and Williamson Counties (Illinois)



for farm land or other productive purposes. Plans for upgrading the land-use followed preliminary studies that revealed a considerable amount of existing non-farm acreage is tillable land while other land in the area may also be converted in this manner to economically useful purposes. Between 6,000 and 7,000 acres of timberland are included in the program. The program as a whole can provide increased agricultural production and afford improved hunting and fishing in cooperation with conservation measures.

Properties and Reserves

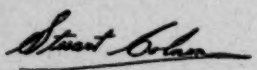
An accompanying reproduction of an area map identifies the location of the Company's principal coal producing properties. Our Southern Illinois mines are located in an area known for many years as the "Quality Circle", and the West Kentucky properties are also favorably identified in the same manner in regard to the quality of coal being marketed from that section. Our association with this kind of identification is insured for a long period of time since your Management has been careful to accumulate new and added reserves of coal as it has drawn upon available resources. Coal as an energy fuel and as a natural resource is receiving revived attention, especially from those who are concerned with the future economic security of the nation and its industrial might.

Organization

In keeping with the Company's retirement policy, Mr. William F. Landes resigned as Executive Vice President of Bell & Zoller Coal Company and Mr. Conrad W. Peterson resigned as Vice President and Treasurer of Zeigler Coal & Coke Company. Mr. Landes continues as a Director of Zeigler Coal & Coke Company. Mr. Warren Wurzburg, Vice President in Charge of Sales of Bell & Zoller Coal Company, was named Vice President of Zeigler Coal & Coke Company and John R. Cosbey was promoted from Assistant Treasurer to Treasurer of Zeigler Coal & Coke Company. Michael K. Reilly was elected Assistant Secretary of Zeigler Coal & Coke Company.

Mr. Landes and Mr. Peterson in their many years with the Zeigler and Bell & Zoller organizations contributed notably to their success. Their advice and counsel, growing out of long years of service in the best interests of our companies, will continue to be available.

Cordially,



STUART COLNON, *President*
Zeigler Coal & Coke Company
Bell & Zoller Coal Company

DX 39 Zeigler Coal & Coke Company and Subsidiaries
1966 Annual Report

* * *

Production and Sales

To Our Shareholders:

The year 1966 was an unsatisfactory one for the Company. As disclosed in quarterly shareholder letters, the Company had to contend during much of the period with adverse conditions at certain of its mines, notably Zeigler #3, finally closed in December. Actions taken to deal with production troubles in these areas were bearing fruit in such manner that improvement in our operating experience was being emphatically shown in early 1967. Also, satisfactory progress can be reported in the construction of our new West Kentucky #9 mine, output of which will go to fill our large Tennessee Valley Authority coal contract. Meanwhile, oil and gas continue to contribute substantially to our income.

Production of coal amounted to 4,245,230 tons in the year ended December 31, 1966. In the preceding year production was 4,468,371 tons.

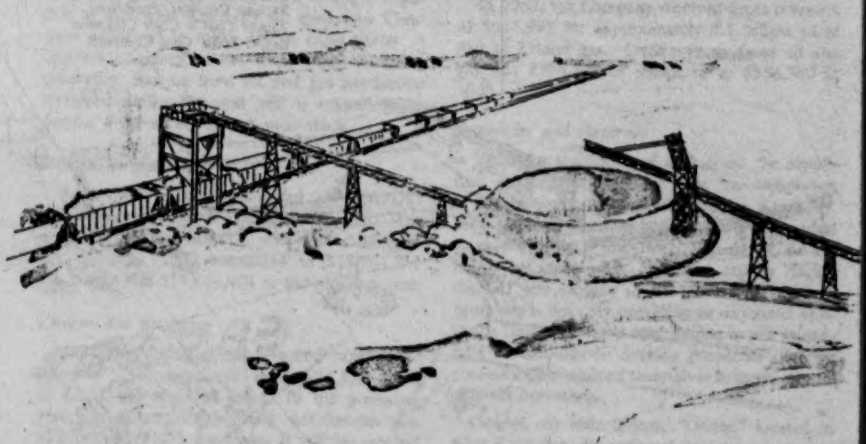
Net sales for 1966 of $17,441,404 compared with $17,600,334 the year before.

Income and Extraordinary Charge

The accompanying Consolidated Statement of Income sets forth in detail the facts about revenues for the year, costs and expenses, federal taxes and takes account of the extraordinary charge made against 1966 earnings incident to the closing of Zeigler #3. It will be seen that income, before federal tax provisions, amounted to $630,224 and that after adjustments of taxes, income was $730,476. Were it not for the extraordinary charge imposed by the closing of Zeigler #3 the statement of the year's earnings would terminate at that point, indicating 1966 earnings equal to approximately $1.53 per share. However, the necessity of applying losses of the Zeigler #3 closing to the fiscal period in which the action took place created the extraordinary charge of $638,093. After that charge, net for the year amounted to $92,383.

TVA Contract

We were able to report, in the annual statement for 1965, that the Company and its subsidiary, Bell & Zoller Coal Company, had been awarded a major coal contract by the Tennessee Valley Authority—a contract involving 26,000,000 tons to be delivered over a 15-year period. Last June, we began construction of the mine in West Kentucky, and slope construction and the building of surface facilities have been progressing satisfactorily. Our production schedule calls for shipments to begin this fall barring unforeseen circumstances. We will, in quarterly reports, keep you apprised of the progress of this mine. The accompanying sketch provides shareholders with an artist's conception of the surface appearance of the mine.



Artist's concept of surface facilities of Zeigler #9 mine.

Natural Gas

The Company has been supplying natural gas from its West Kentucky wells to the line of Texas Gas Transmission Company for a little more than one year. For the year 1966, approximately 2.1 billion cubic feet of gas was supplied at a price of $.17 per one thousand cubic feet which provided revenue amounting to $356,783. Total revenue from oil and gas amounted to $556,340 as compared to $139,726 in 1965.

Capital Expenditures

Expenditures for capital improvements and expansion will be at a high level for the Company in 1967. Under a term loan agreement, negotiated in connection with the Zeigler #9 mine now under construction, the Company may borrow from two banks a total of $3,500,000 to July 5, 1967. As of December 31, 1966, the sum of $300,000 had been borrowed against this commitment, which will continue to be drawn upon as construction proceeds to completion. The bank loan is for a term of five years, at a rate considered satisfactory to the Company. Its provisions are those common to such undertakings. The expenditure for capital purposes in 1966 totalled $1,460,526 and it is anticipated that about the same amount will be required in 1967 over and above the cost of construction of #9.

Outlook

As 1965 ended, I reported to you my hope for an improvement in all of our production operations, especially at our Zeigler #3 mine. Unfortunately, this latter was not to be and so, as I reported earlier, the drastic step of closing the mine was taken.

Our new Zeigler #9 mine supplying the Tennessee Valley Authority contract will contribute little to income in the year 1967. We will be in development work for substantially the entire year. I would like to repeat what was stated when the award was made: we believe it will be a most profitable contract.

The problems we experienced at our other mines, about which I have written during the past year, have largely been resolved. These mines are operating successfully and profitably, and our preliminary figures for January and February are an indication of that fact.

The Company is realizing a large income from gas and oil properties it owns. We have no reason to believe that they will not remain a continuing source of revenue. Drillings are proceeding, and if successes occur in this area, shareholders will be kept advised.

Summary

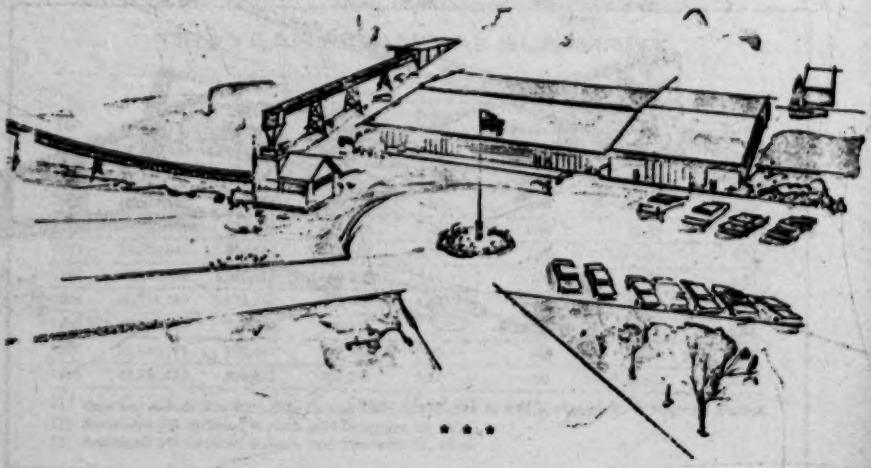
It can be said with a high degree of confidence that the outlook for 1967 is for substantial improvement over 1966. It is not my intention to try to predict the extent of this improvement. Progress here will be covered in the interim reports to you during the course of the year.

Cordially yours,

Stuart Colhon

STUART COLHON, *President*
Zeigler Coal & Coke Company
Bell & Zoller Coal Company

March 27, 1967



• • •

DX 40 Zeigler Coal & Coke Company and Subsidiaries
1967 Annual Report

* * *

TO OUR SHAREHOLDERS

The year 1967 proved to be one of the most profitable years in the history of our Company. In quarterly reports to you during the past year, you were kept informed of our progress. As expected, sales and production were less than in 1966; but, as anticipated, our operating results were very gratifying. In addition to the completion of our West Kentucky #9 mine, our Company continued to make capital expenditures to improve efficiency of the three other operating properties. Income from oil and gas production increased during the year and is exceeding the present dividend on the common stock.

Production and Sales

Production of coal amounted to 4,063,087 tons in the year ended December 31, 1967. The previous year's production was 4,245,230 tons. Net sales for 1967 amounted to $15,861,781 compared with $17,441,404 in the previous year.

Income and Expenses

Net income after all charges and expenses in the year 1967 amounted to $1,341,839 equal to $2.81 per share of stock. In the preceding year, on a comparable basis, net income was $730,476 or $1.53 per share. It will be recalled that in 1966 we had to apply, against that year's earnings, an extraordinary charge of $638,093—the equivalent of $1.34 per share — incident to the closing of the Zeigler #3 mine, and so our actual net income per share for 1966 was 19 cents.

Natural Gas and Oil Income

In 1967, the Company received gross revenues of $357,977 for approximately 2.1 billion cubic feet of natural gas. Total revenue from oil and gas was $596,366 as compared to $556,340 in 1966.

Properties and Reserves

From the standpoint of operations, the significant development in 1967 was the completion of our new mine (#9) at Madisonville, Kentucky. Production at this mine began, on a most modest scale, shortly after mid-1967. The output, we are happy to report, has expanded rapidly during the last few months of the year. This modern operation is not only providing an economic asset to the Company but is contributing to our knowledge of methods to develop properties that we possess which can lend themselves to large-volume contract operations.

One of our older mines, "Oriole," located in West Kentucky, discontinued operations very late in 1967. This action was necessary for the vein

of coal that supported this operation had been worked out and the small amount of coal that remained could not be mined profitably. The closing of this mine did not incur any extraordinary charge for the Company, as in the case of our #3 mine in 1966, because the slope at Oriole offers the possible opportunity of re-opening this property and of mining the #9 seam of coal that lies beneath it. This possibility is being thoroughly investigated and assessed.

Among the improvements in the upgrading of our other properties is the new slope at our Murdock mine, now under construction. When this work is completed, the mine can be more profitably operated to meet the demand of a new long-term contract that was recently awarded us.

We have not, heretofore, reported on the reserves of coal that your Company either owns or leases. Conservatively, our reserves at the 1967 year-end were in excess of 500,000,000 tons of recoverable coal. We are continuing a ceaseless quest to gather coal reserves, and we consider it a major undertaking of the Company. During the last ten years we have mined approximately 42,000,000 tons while in the same period of time we have added over 150,000,000 tons to our reserves. We feel that the coal acreage that has been added during this period has strengthened our position in the industry and enhanced our future production potential for long-term contracts.

The work of reclaiming surface land owned by your Company continues. At present, approximately 4,400 acres are involved in this effort, and it is being directed by a competent agricultural and farming staff. In 1968, additional acreage will become available for cultivation. This is a continuing, long-term project for the Company and one that is certain to add to the over-all profits and value of the Company in future years.

Capital Expenditures

Our capital expenditures during 1967 were larger than the average of past years due primarily to the construction costs of the new #9 mine. Including that undertaking, and the amount spent at other properties to maintain them in efficient condition, the total for the year was $4,750,198. The accompanying financial statements set forth the borrowing that was necessary in order to carry out these programs, notably the investment that had to be made for an entirely new property, namely, our #9 West Kentucky mine. The amount required for future capital outlays will be more in keeping with normal demands of our properties.

Organization

Certain changes in the organization structure of Zeigler Coal & Coke Company took place during the past year. The undersigned was named Chairman of the Board of Zeigler Coal & Coke Company. Mr. Michael E. Walsh, Vice President, was named President of the Company. Mr. John R. Cosbey was named a Vice President.

Bell & Zoller Coal Company, our operating company, had the following changes in its organization: Mr. Warren F. Wurzburg, a Vice President previously in charge of Sales, was placed in charge of Administration of that Company; Mr. Scott M. Rogers, a Vice President, was put in charge of Sales; Mr. Arthur Towles, previously General Mine Superintendent, was named Vice President of Operations. Mr. John R. Cosbey and Mr. Michael K. Reilly were named Vice Presidents.

Without the excellent work of my associates, the gratifying results of 1967 could not have been achieved. I am most grateful to them for giving me the privilege of presenting this fine report for the year 1967.

We look forward to 1968 as being a very good year.

Cordially,

STUART COLNON
Chairman

1) Does not include nonrecurring charge of $838,000 or $1.76 per share.
2) Does not include non-recurring gain of $254,778 or $.53 per share.
3) Additional 3% dividend in stock paid in 1959.

ZEIGLER

Coal & Coke Company

To our shareholders:

High maintenance and operating costs at our Zeigler #9 mine, coupled with difficult mining conditions at Zeigler #4, none of which could have been anticipated, made 1968 a disappointing and trying year. In addition to these operating difficulties, all of our mines were victims of unauthorized work stoppages last Fall while a new union contract was being negotiated. It was truly a year of pyramiding difficulties, and it is to the credit of our management and supervisory team that the final results for the year were not more disappointing.

Operating conditions and production improved considerably during the closing weeks of the year, however, and better results were experienced after the turn into the new year. Therefore, I look forward to a satisfactory showing for the first quarter of 1969 and the balance of the year with our major difficulties, incurred last year, behind us.

This Annual Report brings to you the detailed information about all phases of the financial record of 1968 compared with 1967, and earlier years as well. We would recommend a careful examination of the material on the following pages and will welcome any inquiries Shareholders may wish to make.

Production and Sales

Production of coal amounted to 4,038,356 tons in the twelve months ended December 31, 1968, compared to 4,063,087 in 1967. Net sales for 1968 amounted to $15,312,751 compared with $15,861,781 in the preceding year.

Income and Expenses

Net income, after all charges and expenses in the year ended December 31, 1968, amounted to $112,471 equal to 24 cents per share of common stock of which there were 475,408 shares outstanding at the year end. In 1967 the Company enjoyed one of the best years in its history, earning $1,341,839 or $2.81 per share. Produc-

tion and operating difficulties, earlier described, were so severe that their effect on 1968 profit results for the year were inevitable. We dealt earnestly and as successfully as possible with the problems the year developed, and we can only say that the whole organization is determined to make 1969 a banner year.

Gas and Oil Income

In 1968, income from oil and gas sources amounted to $462,372 as compared with $596,366 in the previous year. In 1968, sales of natural gas amounted to 1.6 billion cubic feet as compared with 2.1 billion in the preceding year. The decline in sales of natural gas and oil may be expected to continue and thus reduce the amount of income from this source. However, plans are under way actively to resume exploratory operations to obtain new sources of revenue from oil and gas on Company-owned property.

Properties and Reserves

Company-owned reserves of coal were increased during 1968, and we estimate that at the present time the Company has reserves in the neighborhood of 550,000,000 recoverable tons, up from 500,000,000 tons in 1967. The size of these reserves testifies to the strong underlying position of your Company, making it possible for it to negotiate long-term contracts with major consumers, potentially the greatest growth opportunity for the Company.

In the 1967 Annual Report we referred to improvements under way at our Murdock (Ill.) mine. The new slope and new raw coal handling facilities there have been completed, and an accompanying sketch shows the modern resulting operation as it is at present.

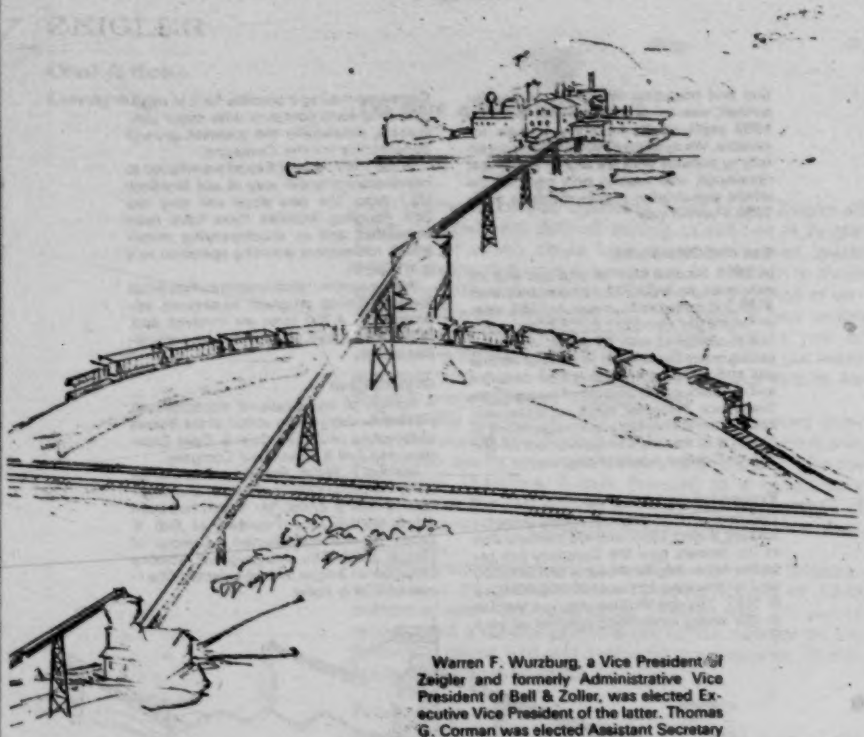
We are continuing to reclaim surface lands for our farming program. At present, approximately 4,700 acres are involved, and, to this total, more acreage will be continually added.

Organization

A number of organizational elections took place early this year by action of the Boards of Directors of Zeigler Coal & Coke Company and Bell & Zoller Coal Company.

Michael E. Walsh, President, was elected Chief Executive Officer of Zeigler and President of Bell & Zoller. Mr. Walsh had been Administrative Vice President of Bell & Zoller. He was also elected a Director of Zeigler Coal. The undersigned remains Chairman of Zeigler and was elected Chairman of Bell & Zoller.

This is an artist's rendering of the new slope and surface raw coal-handling facility of the Murdock (Ill.) mine.



Mr. Walsh has been closely associated with the managements of the companies for many years. He held the posts of Vice President, Secretary and Assistant to the President in years prior to his election, in 1967, as President.

George P. Latchford, III, a partner of the law firm of Latchford, Bianucci, Rice & O'Brien, who has been associated with corporate affairs of our companies, was elected Secretary of Zeigler. He was also elected Secretary of Bell & Zoller. Michael K. Reilly, formerly Assistant Secretary and Assistant Treasurer, was named Assistant to the President of Zeigler. He is also Administrative Vice President of Bell & Zoller.

Warren F. Wurzburg, a Vice President of Zeigler and formerly Administrative Vice President of Bell & Zoller, was elected Executive Vice President of the latter. Thomas G. Corman was elected Assistant Secretary and Assistant Treasurer of the Company.

The Company is indebted to its fine Board of Directors for their loyal and conscientious efforts during a trying year for the Company, and our excellent team of officers and supervisory groups performed nobly, as did all of our employees. It is a pleasure to express the appreciation of the companies to each and every one of them.

Cordially,

Stuart Colnon
Chairman

REPORT

TO THE SHAREHOLDERS

THREE MONTHS ENDED
MARCH 31, 1969

ZEIGLER
Coal & Coke Company
200 SOUTH LA SALLE STREET, CHICAGO, ILLINOIS 60601

To Our Shareholders:

Accompanying this report of operations for the quarter ended March 31, 1969, is a dividend check to your order in the amount of 25 cents per share.

Sales for the first quarter of 1969 amounted to $4,728,335 as compared with $4,414,979 for the same period of 1968. Costs and expenses rose to $4,282,899 from $3,973,342 the year before, leaving an operating income for the first quarter of 1969 of $445,436 compared with $441,637 for the 1968 period. There was a decline in "other income," derived mostly from oil and gas royalties, to $112,469 from $156,276 the year before.

Net income for the first quarter of 1969 amounted to $184,787 equal to 39 cents per share on 475,408 shares outstanding. For the comparable 1968 period, net income was $217,411 or 46 cents per share.

Smaller earnings for the first quarter of 1969 compared with 1968 are attributable to a decline in income from oil

---

CONSOLIDATED STATEMENT OF INCOME

Three months ended March 31,	1969	1968
Net sales	$4,728,335	$4,414,979
Costs and expenses	4,282,899	3,973,342
	445,436	441,637
Other income	112,469	156,276
	557,905	597,913
Provision for depreciation and depletion	373,118	380,502
Income before provision for Federal income taxes	184,787	217,411
Estimated provision for Federal income taxes*	-0-	-0-
Net Income	$ 184,787	$ 217,411
Outstanding shares	475,408	475,408
Net Income per share	$ .39	$ .46

* Sales for 1969 and 1968 include $310,000 and $210,000 respectively of previously deferred coal production payments. Applicable deferred Federal income taxes were offset by the tax effect of percentage depletion allowances, carryforward and other tax credits.

The figures presented in this statement are subject to annual audit.

and gas sources and to losses sustained in operation of our #4 Mine. This mine continues to cause operational difficulties due to faults in the seam. We are hopeful this can be corrected very soon. However, we are happy to be able to report that operating results at all other properties were most satisfactory in the first three months of the year, and we see no reason to anticipate any change in that trend at these mines.

Cordially,

President

REPORT

TO THE SHAREHOLDERS

SIX MONTHS ENDED
JUNE 30, 1969

ZEIGLER
Coal & Coke Company
208 SOUTH LA SALLE STREET, CHICAGO, ILLINOIS 60604

To Our Shareholders:

This report of operating results for the second quarter of 1969 and the first half of the year is accompanied by a dividend check to your order in the amount of 25 cents per share.

For the three months ended June 30, 1969, net income amounted to $363,255 compared to $315,084 in the same period for 1968. Net income per share equalled 74 cents in 1969 against 66 cents in 1968. There were 483,236 common shares outstanding on June 30, 1969, while on June 30, 1968, there were 475,408 shares outstanding. Net sales in the second quarter of this year totaled $4,635,887 compared to $4,070,026 a year ago.

The satisfactory results of the second quarter contributed to an improved showing in the six months ended June 30. Net income of $548,042 in the first half of 1969 compared to $532,495 in the first half of 1968. Reflecting the increased number of shares outstanding this year, profit per share amounted to

---

CONSOLIDATED STATEMENT OF INCOME

Six months ended June 30,	1969	1968
Net sales	$9,364,222	$8,485,005
Costs and expenses	8,214,661	7,478,693
	1,149,561	1,006,312
Other income	171,115	289,754
	1,320,676	1,296,066
Provision for depreciation and depletion	772,634	763,571
Income before provision for Federal income taxes	548,042	532,495
Estimated provision for Federal income taxes*	-0-	-0-
Net income	$ 548,042	$ 532,495
Outstanding shares	483,236	475,408
Net income per share	$ 1.13	$ 1.12

* No provision for Federal income taxes required due to the carry forward of tax credits.

The figures presented in this statement are subject to annual audit.

$1.13 for the first half of 1969 compared to $1.12 in the same period of 1968. Net sales for the first six months of this year were $9,364,222 compared to $8,485,005 in the corresponding period last year.

Other income, principally from oil and gas sources, decreased by $118,639 in the first half of this year compared to the first six months of 1968. For the first six months of 1969, other income amounted to $171,115 compared to $289,754 in the first half of last year.

Operating results at our Zeigler #4 mine improved appreciably during the second quarter. Indications are that the improved operating conditions at this mine as well as at all other properties will continue in the months ahead, and satisfactory earnings for the balance of 1969 are anticipated.

Sincerely,

President

REPORT

TO THE SHAREHOLDERS

NINE MONTHS ENDED
SEPTEMBER 30, 1969

ZEIGLER
Coal & Coke Company
208 SOUTH LA SALLE STREET, CHICAGO, ILLINOIS 60604

To Our Shareholders:

Accompanying this report of operations and earnings for the third quarter and the first nine months of 1969 is a dividend check to your order in the amount of 25 cents per share.

For the three months ended September 30, 1969, net sales amounted to $4,496,172 compared with $3,563,498 in the same period last year. For the 1969 quarter, net income amounted to $255,787 or 55 cents per share, which compared with a net loss in the 1968 period of $56,324.

For the nine months ended September 30, 1969, net sales totaled $13,860,394. For the same period in 1968, net sales were $12,048,503.

Net income for the first nine months this year amounted to $803,829, equal to $1.68 per share as compared with the $466,171 or 98 cents per share earned in the same period last year.

Under date of August 5, 1969, Texas

CONSOLIDATED STATEMENT OF INCOME

Nine months ended September 30,	1969	1968
Net sales	$13,860,394	$12,048,503

DEFENDANT'S EXHIBIT 45

TEXT OF REPORT OF NIXON TASK FORCE ON PRODUCTIVITY AND COMPETITION

SUMMARY OF RECOMMENDATIONS OF THE TASK FORCE ON PRODUCTIVITY AND COMPETITION

We present here a summary of the recommendations of the Task Force on Productivity and Competition. These recommendations are elaborated and defended in the accompanying Report.

1. We recommend that the President issue a general policy statement (a) establishing the Antitrust Division as the effective agent of the Administration in behalf of a policy of competition within the councils of the Administration and before the independent regulatory commissions; (b) urging those commissions to enlarge the role of competition in their industries; (c) marshaling public support for the policy of competition.

2. We urge the commissions to permit free entry in the industries under regulation and to abandon minimum rate controls, whenever these steps are possible -- and we think they usually are; and we urge the President, when occasion permits, to appoint at least one economist to membership in each of the major commissions, and institute effective procedures for the review of the performance of the commissions.

3. To enhance the effectiveness of the Antitrust Division, we urge the Attorney General and the Assistant Attorney General in Charge of Antitrust to insist that every antitrust suit make good economic sense, and to institute semi-public conferences to assist in the formulation and frequent reevaluation of enforcement guidelines.

4. We recommend that the Department of Justice establish close liaison with the Federal Trade Commission at the highest levels, with a view toward fostering a harmonious policy of business regulation.

5. We recommend that the Department bring a series of strategic cases against regional price-fixing conspiracies, which we believe to be numerous and economically important.

6. We cannot endorse, on the basis of present knowledge of the effects of oligopoly on competition, proposals whether by new legislation or new interpretations of existing law to deconcentrate highly concentrated industries by dissolving their leading firms. But we urge the Department to maintain unremitting scrutiny of highly oligopolistic industries and to proceed under section 1 of the Sherman Act--which in our judgment reaches all important forms of collusion--in instances where pricing is found after careful investigation to be substantially noncompetitive.

7. The Department of Justice Merger Guidelines are extraordinarily stringent, and in some respects indefensible. We suggest a number of revisions in the accompanying Report.

8. We strongly recommend that the Department decline to undertake a program of action against conglomerate mergers and conglomerate enterprises, pending a conference to gather information and opinion on the economic effects of the conglomerate phenomenon. More broadly, we urge the Department to resist the natural temptation to utilize the antitrust laws to combat social problems not related to the competitive functioning of markets.

9. We recommend new legislation to increase the monetary penalties, at present largely nominal, for price fixing.

10. We urge a new policy for antitrust decrees. The Department should not seek the entry of regulatory decrees: decrees that envisage a continuing relationship with the defendant. Save in exceptional circumstances, all decrees should contain a near termination date, ordinarily no more than 10 years from the date of entry. And the Department should undertake a review of existing decrees to determine which should be vacated as obsolete or inappropriate.

11. The Expediting and Webb-Pomerene Acts should be repealed, and the Robinson-Patman Act substantially revised.

12. Mr. Alexander L. Stott dissents from certain parts of the Report and from certain of the above recommendations. Mr. Raymon H. Mulford dissents from two recommendations.

REPORT OF THE TASK FORCE ON PRODUCTIVITY AND COMPETITION

The Task Force on Productivity and Competition submits its report on the problems which will be confronted by the new administration in this area, and the steps which we recommend to be taken. The report is presented under three general headings:

I. The Administration's Policy of Competition and the Role of the Antitrust Division and the Regulatory Commissions in This Policy.

II. Organization and Procedure in the Antitrust Division.

III. Recommendations for Change in Antitrust Policy.

Individual task force members would often change the emphasis of the Report, and larger differences are presented as dissents.

I. General Policy

A. Antitrust Policy

The American Way, as we are constantly told, is to rely upon competitive private enterprise to do most of the work of allocating resources to industries and firms, organizing production, and providing economic progress. We are constantly travelling a shorter distance down this Way, however: for good reasons and for bad we have almost continuously expanded the governmental controls over economic life, and in recent years important restrictions have been placed upon private enterprise to protect the balance of payments. Some of the vast arsenal of public controls are unnecessary, and a large proportion of the necessary controls are excessively restrictive of competition. As one example, the safety of financial institutions is of course a major public concern, but this safety can often be achieved by insurance or similar devices, and hardly ever requires that competition be suppressed to the extent that the most incompetently managed institution will be prosperous, and hence safe.

The traditional American policy of seeking to minimize regulation of economic life is a profoundly wise policy, and deserves to be reasserted and implemented. Both logic and political expediency -- not always close allies -- dictate that economic freedom be subjected to the discipline of competitive markets. We believe, therefore, that the President should issue a general policy statement on competition and public regulation, to achieve at least three important purposes:

1. To establish the Antitrust Division as the effective agent of the Administration in behalf of a policy of competition, in intragovernmental groups, and before independent regulatory bodies.

2. To encourage and urge the regulatory bodies -- which cannot ignore the clear policy positions of the President even when his appointive power is dormant -- to enlarge the role of competition in their respective industries.

3. To revive and strengthen public support for the policy of competition, and to establish the bona fides of the Administration as the protector of both consumer and businessman.

An executive order or a major presidential address would be an appropriate vehicle for this declaration. Whether or not a formal statement commends itself, we believe that the correct policy is one of persistent and resourceful exploitation of competition wherever possible.

B. The Policy of Competition in the Regulated Industries

Our mandate to examine productivity and competition in the American economy compels us to brief examination of the work of the regulatory commissions themselves. The regulated industries comprise one-eighth or more of the economy in terms of income, and are too important to be omitted from our Report.

The tasks assigned to the regulatory agencies are various: to prevent monopoly pricing (as with telephone and pipelines); to prevent congestion (as with radio and television frequencies); to provide safety to savers (as with financial institutions); and so on. It is not possible for us here to examine these purposes critically, although it is notorious that in certain industries (such as motor trucking) there is no respectable case for economic regulation. There is widespread disenchantment with regulatory purposes as well as regulatory processes, and a general belief that excessive rigidity, expensive review of economically trivial details, and frequent failure to achieve any important results have characterized our regulatory efforts.

In two directions, we are convinced, there should be a major reorientation of the regulatory policy:

1. Entry of new firms should be encouraged wherever an absolute contradiction with regulatory goals is not involved. At present the practice is universally the opposite: to prohibit or ration with utmost severity the entrance of new firms.

2. Allow much freedom in price competition. The regulatory bodies should abandon minimum rate regulation whenever possible (and it is usually possible), and rely chiefly on maximum rate regulation.

Where rates are regulated, it is essential to make both changes: there is little merit in allowing additional firms to enter if they are not held to the test of unfettered competition with the existing firms.

We urge the Administration to pursue three complementary paths of reform in the regulated industries:

First, the commissions should have the merits of competition pressed upon them. Competition is not a matter of all or none, and the fact of regulation should not exclude competition as a force at each of a hundred points where it is relevant and feasible. If there must be only one railroad there can still be several truckers, several freight forwarders, and the possibility of inter-modal competition.

Second, the primary method of giving a larger role to competition is by appointing commissioners who understand and believe in a policy of competition. We believe that every regulatory body should have at least one economist as a commissioner. Quite aside from the implementation of the desire for more competition, this proposal has a decisive defense: economic regulation poses more economic than legal problems, and an economist knows more about economics than a non-economist. The economic triviality and irrelevance of much activity of the regulatory commissions is patent and inexcusable.

Third, the regulatory commissions are largely out of public control. Once in a decade or two, at most, a commission will be investigated by Congress. The Administration should explore methods of getting more meaningful and effective reviews than we now get. We do not know whether the best method is an enlarged Bureau of the Budget section, a national commission, the creation of academic review committees, or a special adviser to the President. The best method, however, is surely not infrequent, partisan Congressional review. The present role of the regulatory bodies is undirected, unmeasured, and unevaluated.

II. Organization and Procedure in the Antitrust Division

A. The Utilization of Economic Knowledge

We anticipate little opposition to the proposition that the Antitrust Division make full and effective use of economists and their special skills. These skills are often necessary to understand the effects of economic practices (an example is market-sharing in fixed proportions), to assess the economic importance of individual cases, and to assist in devising remedies that will not shatter on economic realities. We endorse the policy of having a highly professional economist serving as adviser to the head of the Division, and a strong permanent staff of economists.

The problem is not the goal of an economically sophisticated antitrust policy, but its implementation. A division charged with the enforcement of a statute must of course be directed and largely staffed by lawyers. Unless there are substantial incentives to the staff to utilize economics -- whether by central direction, or vastly more powerfully, by demonstrated assistance in winning cases -- the non-lawyer will often be viewed by the lawyers as a mysteriously necessary obstacle to smooth operations. The Assistant Attorney General will have succeeded in making a truly major contribution to antitrust policy if he establishes the relevance of economic knowledge.

B. The Development of Criteria for Classes of Cases (Guidelines)

When the Antitrust Division is confronted by a large number of similar cases -- and it must now be scanning many hundreds of mergers each year -- it will inevitably have rules to guide the numerous men who pass on individual cases. The question is not whether to have criteria or guidelines, but how to arrive at them.

We believe, for reasons we discuss below, that the present merger guidelines are questionable in important respects. Here we consider the procedures for formulating guidelines.

A set of rules for a class of cases will be desirable only if two conditions are fulfilled:

1. There are a large number of uncontroversial, easily identified cases. If there are not, the rules give little help to either business or the Division.

2. Controversial or objectionable cases cannot be repackaged to avoid scrutiny.

The way to determine whether mergers, for example, meet these conditions is to examine a large number of them in the light of legal and economic knowledge. The Antitrust Division will perform this task vastly better if it uses the large amount of professional expertise available outside the Division. We therefore recommend that the Division have semi-public conferences to explore difficult areas of policy, inviting legal and economic experts to propose or discuss guidelines. Some members of the task force would prefer to have formal notice and public hearings in establishing rules. If rules are adopted, a periodic review of them by the same procedure will be a useful method of conferring flexibility upon them. A specific application of this method is proposed below for mergers.

C. The Role of the Federal Trade Commission

No review of antitrust policy would be complete that ignored the Federal Trade Commission, which is charged with enforcement of, among other statutes, the Clayton Act, of which Section 2, the Robinson-Patman Amendment, and Section 7, prohibiting mergers and acquisitions that may substantially lessen competition, are particularly important; and the Federal Trade Commission Act, whose operative provision, Section 5, forbids "unfair or deceptive acts or practices", a term that has been interpreted to embrace even more than the vast area of anticompetitive behavior proscribed by the Sherman and Clayton Acts, as well as consumer fraud and some "immoral" sales methods such as lotteries. As is evident, the Commission's jurisdiction largely overlaps that of the Antitrust Division.

In its antitrust work, the FTC has concentrated on price discrimination, on practices believed to oppress or coerce small dealers, and on mergers, especially vertical and conglomerate, and usually in industries such as food products, groceries, and cement--industries which by long-established understanding with the Antitrust Division have been assigned as the Commission's sphere of primary competence.

Unhappily, little that the Commission undertakes in the antitrust area can be defended in terms of the objective of maintaining and strengthening a competitive economy. Consider price discrimination. There is now an impressive body of literature arguing the improbability that a profit-maximizing seller, even one with monopoly power, would or could use below cost selling to monopolize additional markets. Yet, not only has the Commission continued to bring predatory price discrimination cases, but the alleged danger of predatory pricing remains a principal prop of its vertical and conglomerate antimerger cases. As for "secondary line" discrimination (that is, giving discounts to some dealers or distributors but not to others who compete with them), the Commission has never attempted to differentiate those cases (if there are any) in which a monopolistic buyer is able to extract unjustified price concessions from his suppliers to the prejudice of his competitors from those in which discrimination is employed by oligopolistic sellers who wish to cut prices secretly,--and should be encouraged to do so--and those in which price differences (which the Commission tends to equate, erroneously, with discriminations) are not, in fact, discriminatory. Over the last eight years the Commission, often under the prodding of reviewing courts, has pulled some of the sting from enforcement of Robinson-Patman against secondary-line discrimination. It has demanded somewhat stronger proof of competitive injury; the meeting-competition and cost-justification defenses have been rendered meaningful; and the provisions of the Act relating to advertising allowances and brokerage payments are, in general, no longer used to compel sellers to compensate for services that are not economically beneficial to the seller (such as advertising by tiny retail outlets or brokerage when a broker's services can be dispensed with). Although the retreat from per se rules against secondary-line discrimination has led to a general diminution of enforcement activity by the FTC (private suits continue, of course, and are discussed later) the Commission still brings many cases that impair, rather than promote, competition and efficiency. For example, the Commission has in recent years waged vigorous war against "functional discounts", which are discounts offered to middlemen who perform certain distributive functions (such as warehousing) that other middlemen, who are not given the discounts, do not perform. Moreover, as explained later in this Report, we can conceive of no case of discrimination in which the Sherman Act would not provide an adequate remedy--adequate, that is, to protect the interest in maintaining an effectively competitive economy--and so we view Robinson-Patman enforcement as inherently likely to be pushed beyond proper limits.

The efforts of the Commission to protect small dealers from allegedly unfair and coercive business practices constitute a dark chapter in the Commission's history. Much of this enforcement activity does not eventuate in formal proceedings. What happens is that a dealer who is terminated, for whatever reason, is likely to complain to the Commission, knowing that the relevant Commission staff is well disposed toward "small business". The staff uses the threat of an FTC proceeding to get the supplier to reinstate the dealer, and if threats fail--usually they succeed--the FTC may file a complaint charging the supplier with having cut off the dealer because he was a price cutter, or for some other nefarious reason. Our impression, in sum, is that the Commission, especially at the informal level, has evolved an effective law of dealer protection that is unrelated and often contrary to the objectives of the antitrust laws. The Commission is supported in this endeavor by the Supreme Court's ruling that Section 5 of the FTC Act empowers the Commission to suppress practices that resemble antitrust violations.

With respect to the Commission's enforcement policy in the merger field, it is illuminating to compare the recent statements of Commission merger policy with the Department of Justice Merger Guidelines, discussed elsewhere in this Report. The Commission is even more severe. Unlike the Department, it attaches a good deal of significance to the absolute size (independent of market share) of merging firms; to the alleged power that large firms have over small; and to the dangers of "price squeezes".

It will, for example, challenge virtually any acquisition by a cement producer of a ready-mix concrete company, virtually any substantial acquisition by a large food chain, etc. The Merger Guidelines are models of restraint compared to those promulgated by the Commission, which are as hard on economic theory as on mergers.

We conclude that substantial retrenchment by the Commission in the antitrust field is highly desirable. In addition to retrenchment (at least by stopping the increase of the Commission's appropriations), its resources devoted to regulating competition might be redeployed. The two principal possibilities are (1) consumer protection, and (2) economic studies utilizing the very broad fact-gathering powers vested in the Commission by its enabling legislation. Unhappily, either route could be followed in a way that endangered competition. An incompetent economic study can be influential on policy makers -- witness the influential 1948 FTC study which erroneously suggested that concentration was on the rise in American industry. Overzealous enforcement of consumer-protection legislation can also have errant results. We note that the application of consumer-protection law is almost always invoked not by consumers but by competitors, whose interest lies in protecting their market, not in giving consumers full information; and that elaborate requirements relating to packaging, safety, etc. can curtail consumer choice, limit competition, reduce the consumer's incentive to exercise care, and -- what is most serious -- impose substantial costs on society.

The Federal Trade Commission urgently needs a basic reform, but this need will be difficult to fulfill. Quite apart from the fact that there are no vacancies on the Commission, any dramatic or far-reaching Presidentially-inspired reforms would run up against the long tradition of regarding the independent agencies in general -- and the FTC in particular -- as "arms of the Congress." That has at times meant an office of economic opportunity for Congressmen; more important, it means that a strong showing of Presidential interest in the operations of the Commission will not be welcome on the Hill.

Perhaps the best short-run path of improvement runs through the offices of the Attorney General and the Assistant Attorney General in charge of Antitrust. Since the jurisdictions of the Commission and of the Antitrust Division are so largely overlapping, no one could object to the establishment between the Commission and the Division of close liaison at the highest levels. Indeed, it is something of a wonder (though explicable in terms of bureaucratic rivalry) that such liaison has been wholly lacking heretofore; the only coordination between the agencies is at very low levels, and consists largely of haggling over who shall sue in cases where both agencies are interested. Especially at the beginning of a new Administration, it should be quite feasible, as well as wholly appropriate, for the Attorney General and Assistant Attorney General to establish a close cooperative relationship with the Chairman of the Commission. We think it likely that the Commission will pay some heed to the Department's views, if forcefully expressed, on antitrust and trade-regulation policy.

III. Recommended Changes in Antitrust Policies

The general policies of the Antitrust Division are profoundly good, and we propose no major change in its emphasis or directions of policy. In fact, the main thrust of the following recommendations is that certain recent developments of policy or doctrine should not be allowed to divert the agency from its basic task of striking down conspiracies and mergers in restraint of trade.

A. Price-Fixing

The price-fixing cases of the Antitrust Division are its bread and butter, and understandably its staff would prefer more cake. We emphasize the great economic and social importance of continued, vigilant, aggressive seeking-out and conviction of conventional price-fixers. Every victory weakens the efficiency of undetected collusion in that area of economic life. We strongly recommend the bringing of a series of strategic cases against regional conspiracies, which we believe to be numerous and economically important.

B. Concentration and Oligopoly

Oligopoly -- the industry composed of a small number of independent enterprises -- undoubtedly presents the most difficult problems in a policy for competition. The difficulties arise because of a combination of three circumstances. The first is factual: there are many important industries in our economy whose structure is oligopolistic -- how large a number depends upon what a "small number of firms" means. The second is interpretive: the economists have not succeeded in fully identifying the characteristics of an industry which determine whether it will behave competitively or monopolistically. The third is the matter of action: if firms in an oligopolistic industry are convicted of collusive behavior, must one press for a remedy so radical as dissolution in order to stop future repetitions of the offense? (And should the standards of permissible concentration be wholly different for pending mergers than for established enterprises?)

The circumstances which determine whether or not the firms in an oligopolistic industry will usually behave more or less competitively (seeking by independent actions to improve their individual profits at the cost of rivals' profits, with the eventual general erosion of unusual profits) are partly known:

1. The easier (quicker and cheaper) new firms can enter the industry, the smaller and more short lived will be the monopolistic restrictions.

2. The more elastic the demand for the product of the oligopolistic industry the less the reward from restrictions of output below the competitive level, and hence the less the inducements to act collusively. This in turn usually depends upon what alternative products the buyers may turn to.

3. The larger the effective number of firms the less the probability of collusive behavior -- collusion increases in expense (including probability of detection) as numbers increase. However, a given number of firms is more likely to result in collusion, the more concentrated is production in the hands of a few firms. If we correct for this and take the effective number of rivals to be the number of rivals of equal size which would produce the same competitive situation as the firms (not of equal size) actually in the industry, the effective number may be very roughly estimated at twice the number there would be if all firms were as large as the largest in the industry.

That is, if the largest firm has 1/5 of the industry's output and the remaining firms fall off in size regularly, the effective number of firms is of the order of magnitude of 10. By this is meant that the concentration in the industry is equivalent to what would exist if there were 10 firms of equal size.

There are other influences which probably but less certainly affect the probability of competitive behavior. One of these is the size of buyers: larger buyers, for a variety of reasons including possibility of backward integration, make for more competitive prices.

Numerous statistical studies have been made of the relationship between concentration and rates of return on investment, and these studies generally yield positive but loose relationships: concentration is not a major determinant of differences among industries in profitability, although it may sometimes be a significant factor. It appears also to be true that somewhere between five and ten effective rivals (i.e., a largest firm with a share of 1/5 to 1/5) are usually enough to insure substantial elimination of the influence of concentration upon profitability.

Concern with oligopoly has led to proposals to use the antitrust laws (perhaps amended) to deconcentrate highly oligopolistic industries by dissolving their leading firms. We cannot endorse these proposals on the basis of existing knowledge. As indicated, the correlation between concentration and profitability is weak, and many factors besides the number of firms in a market appear to be relevant to the competitiveness of their behavior. While a flat condemnation of oligopoly thus seems to us unwise, we commend to the Antitrust Division a policy of strict and unremitting scrutiny of the highly oligopolistic industries. If, in any of these industries, pricing is found after careful investigation to be substantially noncompetitive, the Division will have a clear basis for proceeding against the leading firms under Section 1. Collusion that can be inconvertibly inferred from behavior (such as persistent, stable price discrimination in the economist's sense) should not bring immunity from the Sherman Act, and we are confident that structural remedies will be sanctioned by the courts in cases where, due to number of firms and the other conditions of the market, lesser remedies are likely to be unavailing. In assessing the gain from such structural remedies, account should be taken of any reduction in efficiency which the remedy entails.

The concern with oligopoly is also quite visible in the Department of Justice's most recent innovation, the Merger Guidelines, to which we now turn.

C. Mergers and the Guidelines

The present merger Guidelines impose stringent restrictions upon the relative sizes permitted to companies which desire to merge. The impact of these percentages is reinforced by a definition of the market (within which shares of companies are reckoned) so loose and unprofessional as to be positively embarrassing. We propose to reverse this emphasis: not to tell companies which mergers are forbidden, but which mergers are permitted. We are persuaded that this orientation better serves the interests of both business and the Antitrust Division. Before we turn to the methods by which more appropriate Guidelines for mergers are achievable, we shall briefly discuss the present Guidelines, and indicate our reasons for dissatisfaction with them in their present orientation.

Market Definition. The delineation of a relevant market within which to appraise the lawfulness of a merger is crucial, for if the market is drawn narrowly enough, virtually any merger can be made to seem monopolistic in its effects. Unfortunately, as they are presently drafted the Guidelines seem to invite a substantial degree of market gerrymandering, especially in delineating regional or local markets. The Guidelines' test of whether a product is sold in less than a national market is loose. Any group of competing sellers in the industry is a relevant market, unless the defendant can show that there is no "economic barrier" preventing other sellers from selling in the particular area. Such a barrier may consist of freight costs, customer inconvenience, customer preference for the brands presently sold in the area, or the absence of good distribution facilities.

This is a misleading test. An industry may be riddled with the kind of "barriers" cited in the Guidelines and yet still not contain any meaningful local markets. An example will illustrate. Assume that the price of steel bars is $2 in Minnesota and $1.60 in Chicago, and the cost of shipping the bars from Chicago to Minnesota is 41 cents. On these facts, it is plain that the Minnesota sellers could not raise their price significantly without immediately losing their business to the Chicago sellers. Minnesota is thus not a meaningful local market even though, at the existing price, freight costs do impose an effective economic barrier against the Minnesota sellers. Moreover, additional firms will establish production or distribution facilities in Minnesota if it becomes profitable to do so. The same analysis can be extended to the other barriers discussed in the Guidelines.

In criticizing the test of "economic barrier", we do not mean to deny the difficulty of devising rules of market definition that will be at the same time simple and sensible. This is most probably not an area in which Guidelines provide a useful enforcement tool. If there are to be Guidelines, though, they should at least not misstate the applicable economic theory. It would, accordingly, be a decided improvement if the Guidelines were revised (at a minimum) to explain that a distant seller of a product must be included in the local market if a modest price increase in the local area--a price increase unrelated to his costs--would bring him in forthwith.

Horizontal Mergers. The provisions of the Guidelines governing horizontal mergers--that is, mergers between direct competitors--are extraordinarily strict. If a market is "highly concentrated" (defined as where the 4 largest firms account for at least 75 percent of the sales in the market), then a merger between two firms, each of which has a 4 percent market share, will be challenged; and if the acquiring firm has a share as large as 15 percent, then the acquired firm need have only a 1 percent share for the merger to be challenged. Different levels of permissible size are stated for less concentrated industries, and some account is taken of the trend of concentration.

We agree with the basic premise of the horizontal-merger provisions of the Guidelines that market-share percentages are the appropriate touchstone of illegality for such mergers. We would favor levels of concentration modestly lower than those now used (but differently structured), with the purposes of (1) allowing all mergers below the Guidelines levels, and (2) not prohibiting, but reviewing, those above the critical level, with an implied probability that the more a proposed merger lies above the level of automatic approval, the less the probability of its acceptance. We discuss below the procedure that should be followed better to utilize existing knowledge in fashioning the Guidelines.

Vertical Mergers. A merger that involves the acquisition not of a competitor but of a customer or a supplier is a vertical merger, and the present Guidelines contain strict provisions limiting such mergers. For example, if the supplying firm in the merger has a 10 percent share of its market and the purchasing firm has 5 percent of the purchases in that market, the merger will be challenged.

Our task force is of one mind on the undesirability, of an extensive and vigorous policy against vertical mergers: vertical integration has not been shown to be presumptively noncompetitive and the Guidelines err in so treating it. Within this area of agreement there are two positions around which the task force members cluster.

The one position asserts that many, and perhaps most, vertical mergers which do not have direct horizontal effects are innocuous, but that in certain situations a vertical merger will have anti-competitive effects. These situations include: increases in the capital or other requirements for an integrated firm may reduce the possibility of new entry; or price discrimination may be implemented when a monopolist integrates forward or backward. A showing that an anticompetitive effect of these sorts exists is essential before a vertical merger is challenged.

The other position denies that a vertical merger has the potentiality for economic harm in the absence of horizontal effects. To some of our members, it is wholly implausible that vertical integration places entering firms at a disadvantage. A seller who fails to minimize his input and distribution costs will be undersold by his competitors: he cannot afford to sell to or buy from an affiliate if there are more efficient alternative means of supply and distribution available to his competitors (and to him). Even if the seller is a monopolist, the desire to maximize profits will lead him to seek the most efficient methods of supply and distribution, and there will be ample opportunities for nonaffiliated suppliers and outlets to compete for his patronage. Except in the case of the monopolist who cannot discriminate in price effectively without control of his outlets, vertical integration will be initiated and maintained only if and so long as it is justified by the cost savings it permits. It is not a method of extending monopoly power.

The two positions coalesce on one policy conclusion: vertical mergers should not be forbidden as a class.

The Conglomerate Merger. The large conglomerate enterprise with an aggressive acquisition policy has only recently become prominent and newsworthy. ***

Antitrust law has seemed to some a convenient weapon with which to attack large conglomerate mergers. If one interprets "elimination of potential competition", "reciprocity", and "foreclosure" as threats to competition, one can always bring and usually win a case against the merger of two large companies, however diverse their activities may be. These are often makeweights. The economic threat to competition from reciprocity (reciprocal buying arrangements) is either small or nonexistent: monopoly power in one commodity is not effectively exploited by manipulating the price of an unrelated commodity. The argument advanced against the simplistic treatment of vertical mergers--essentially that one cannot use the same monopoly power twice--also challenges the fears of reciprocity.

Potential competition, on the contrary, can be a decisive limitation on the exercise of market power, and a merger which eliminates an imminent new competitor is anticompetitive. If entry into a field is relatively easy, however, there are a vast number of potential entrants and the elimination of one or a few has no effect. If entry is difficult, and only a select few firms are capable of entry and on the record likely to enter, their independence should be preserved. The identity of potential entrants should not be established by introspection. If the producer of X is truly a likely entrant into the manufacture of Y, the likelihood will have been revealed and confirmed by entrance into Y of other producers of X (here or abroad), or by the entrance of the firm into markets very similar to Y in enumerable respects.

We seriously doubt that the Antitrust Division should embark upon an active program of challenging conglomerate enterprises on the basis of nebulous fears about size and economic power. These fears should be either confirmed or dissipated, and an important contribution would be made to this resolution by an early conference on the subject. If there is a genuine securities market problem, probably new legislation is necessary. If there is a real political threat in giant mergers, then the critical dimension should be estimated. If there is no threat, the fears entertained by critics of the conglomerate enterprises should be allayed. Vigorous action on the basis of our present knowledge is not defensible.

The central task of the Antitrust Division is to preserve competition in the American economy. This is a splendid and challenging task and deserves and requires the full resources of the Division. We shall be much the losers if we compromise the discharge of this central task by burdening the Division also with tasks such as the combatting of organized crime or the achievement of general political goals.

The Use of Conferences. We have proposed that conferences be used to revise the Guidelines and to identify the problems, if any, created by the large conglomerate enterprise. The conference will allow the Antitrust Division to utilize the expertise and wide factual knowledge of economists, lawyers, securities analysts, and other groups without the laborious machinery of formal hearings. We strongly recommend that before such conferences are held, leading students and exponents of particular positions be asked to prepare position statements which present explicit and specific theories and evidence. Then the conference members will have specific questions to address and specific views to combat or support.

D. Antitrust Sanctions

The cutting edge of law is not the abstract statement of a legal duty but the sanction provided for its nonperformance, and that is true of the antitrust laws as of other systems of legal obligation. It is essential that those laws clearly and accurately define and forbid the practices that impair competition and efficiency but it is equally essential that the sanctions for violation be effective in compelling compliance and with a minimum of undesirable side effects.

In testing the antitrust sanctions by this standard, it will be helpful to distinguish two purposes of sanction: that of preventing (or, if it has already occurred, undoing) a specific violation; and that of deterring violations that might not always be detected.

Sanctions of the first type--remedial sanctions--suffice where there is no problem of detection (e.g., in the case of an illegal merger). But take the case of price-fixing. Price-fixing conspiracies can be, and one suspects are, successfully concealed. A sanction that merely prevented the continuation of the conspiracy, such as an injunction, or one that merely restored the losses of the injured consumers, such as ordinary damages, would in these circumstances probably be insufficient. For in deciding whether to comply with the law, a seller would discount the very modest (or negligible) injury to him if his participation in a price-fixing conspiracy was detected, and he was required to stop and to pay actual damages, by the considerable probability that he would escape detection altogether; and he could conclude that he had little to lose by participating. That is why punishment by fine or imprisonment is an appropriate sanction for illegal price-fixing: it provides deterrence, as the purely remedial sanction does not.

But the deterrent sanction in antitrust is weak. A price fixer can be imprisoned and fined but prison terms are almost never imposed in price-fixing cases and when they are, they are nominal in length; and the maximum fine of $50,000 will deter only a very small corporation. The possibility of a private treble-damage suit doubtless provides additional deterrent effect, but there are serious limitations: judges are reluctant to authorize damage awards that seriously hurt a company; damages are difficult to prove in price-fixing cases; and most important, the injury caused by a price-fixing conspiracy is often so widely diffused (for example, among millions of consumers) that no one has an incentive to bring a suit. The government itself can sue for damages only when it was the victim of the unlawful conspiracy.

If concealable offenses under the antitrust laws are to be effectively deterred, either the resources devoted to the detection of such offenses must be vastly augmented--and there are obvious limitations to this route--or the fines must be increased to a point where they will give even the large corporation considerable pause before participating in (or condoning its officers' individual participation in) an illegal conspiracy. Precedent for much more severe sanctions can be found abroad. The European Economic Community, for example, may impose penalties of up to $1,000,000, or, in the case of willful violations, up to 10 percent of annual sales. We have not attempted to determine the appropriate level of antitrust fines, but we urge the Department of Justice to accord high priority in its legislative program to the upward revision of these penalties.

The creation of a more realistic scheme of antitrust fines would enable a long-overdue reexamination of the punitive aspects of the private antitrust suit. It is anomalous that private plaintiffs who have done nothing to uncover or prove an antitrust violation (the usual case) should be permitted to claim treble damages on the basis of a judgment obtained by the Antitrust Division. In such circumstances, the excess over actual damages and costs represents a pure windfall to the private plaintiff. Today, one can defend this arrangement on the ground that it furnishes an element of added deterrence which is necessary in light of the inadequacy of the existing criminal fines. But that ground would be removed if the fines were revised to a more appropriate level; and a more rational scheme of deterrence would become feasible. We are also deeply concerned that private treble damage suits provide undesirable opportunities for harassment and the furtherance of a variety of anticompetitive practices.

With regard to remedial sanctions, the principal question involves the undesirable side effects that frequently accompany a poorly formulated decree. Ideally--and it is an attainable ideal--an antitrust decree should be a "one shot" affair: dissolving the monopoly, or divesting the acquired assets, or terminating the basing-point system, etc. The antitrust laws were never intended to be a system of continuing regulation. Antitrust policy has as its basic principle the preservation of a competitive environment within which individual enterprises are free from continuing supervision. When a decree says, in effect, "Let us return to the court, or give the power to the Antitrust Division, to adjudge the propriety of various behavior of the defendant for years to come," one can be sure that the suit has failed in its purpose of restoring competitive conditions. Nor is the Department equipped to function as a regulatory agency, and it is not likely to escape that common pitfall of economic regulation, the suppression of competition. Nonetheless, such decrees are frequently entered, especially by consent of the parties in cases where the Department (or the Federal Trade Commission, to which these remarks apply with equal, if not greater, force) is unsure of its litigation prospects and wishes to salvage something from the investment of enforcement resources.

For the future, we urge that the Department adopt a firm policy of not proposing or accepting decrees that envisage a continuing, regulatory relationship with the defendant. A correlative policy that we suggest is that every decree contain a definite--and near--termination date, ordinarily no more than 10 years from the date the decree is entered. Such a principle would compel the Department to devise decrees that restore competition rather than establish regulation, as well as assure that decrees do not remain in effect long after the relevant industrial conditions have changed (such as with the 1920 decree against the meat packers).

Little is known of the extent to which a large number of past decrees are still operative, and if operative, of any real value in protecting competition. We recommend, therefore, some such procedure as this in dealing with outstanding decrees:

1. The past decrees still running should be compiled, and the types and duration of prescribed conduct summarized.

2. The current relevance of the decrees, or at least those running against large industries, should be examined--presumably by the economics section of the Antitrust Division.

3. The older (say 25 years and over) and obsolete younger decrees should be vacated.

E. Recommended Changes in Antitrust Statutes

Several legislative reforms could improve substantially the functioning of the antitrust laws. We have recommended above a substantial increase in the maximum level of fines. In addition, we recommend immediate repeal of the Expediting Act. The low quality of many Supreme Court antitrust opinions can be traced in no small measure to the fact that direct appeal frequently requires the Supreme Court to pass on an extensive record without the benefit of the winnowing and focusing process involved in an intermediate appeal. The Supreme Court itself has noted that direct appeal is unsatisfactory. If repeal is politically impossible, then an amendment that would drastically limit the number of direct appeals would be desirable.

The Webb-Pomerene Act should also be repealed. The creation of cartels in foreign commerce is antithetical to the underlying theory of the Sherman Act. The danger that exempted cooperation between competitors in the export field will lead to illegal cooperation at home is too great to be viewed as merely a potential abuse. Nothing in U. S. domestic competition policy or foreign economic policy warrants the retention of this outmoded approach to international competition.

On the agenda for long-term legislative reform must be the Robinson-Patman Act. The Act leads to rigidity in distribution patterns and to uniform, inflexible pricing. In industries with few sellers, price reductions are more likely to be made if they can be made covertly. Such limited reductions often lead over time to generally lower prices. Thus, a prohibition against price discrimination may preclude the kind of competition that is most likely to lead to lower prices in oligopolistic industries. We view the Federal Trade Commission's tendency in recent times to relax the enforcement of the Act as a desirable but, so long as private treble damage actions are available, an inadequate reform.

In reforming the Robinson-Patman Act, two kinds of amendment are desirable. First, the general prohibition against price discrimination in Section 2(a) should be made more supple by broadening the meeting competition and cost justification defenses so as to make them more readily available for sellers whose price differentials do not stem from a predatory purpose and do not injure competition in the market place (as opposed to disadvantaging individual firms). Second, the more absolutist brokerage, payments and services prohibitions of subsections (c), (d) and (e) should be repealed while making clear that the standards of amended subsection (a) remain applicable to practices that would previously have been treated under those repealed subsections. The Task Force recognizes the political support that the Robinson-Patman Act retains in some quarters and the danger that an attempt to amend the Act might give particular interests an opportunity to add even more restrictive provisions. As a consequence, some of our members view amendment of the Act as a long-term, albeit important, reform; others wish to leave it alone.

UNITED STATES DISTRICT COURT

NORTHERN DISTRICT OF ILLINOIS

EASTERN DIVISION

UNITED STATES OF AMERICA, Plaintiff,	)	CIVIL ACTION
v.	)	NO. 67 C 1632
GENERAL DYNAMICS CORPORATION; THE UNITED ELECTRIC COAL COMPANIES; and FREEMAN COAL MINING CORPORATION, Defendants.	)	

ANSWERS TO INTERROGATORIES
OF THE DEFENDANTS

Interrogatory 1

Define the following terms or phrases as used in the complaint:

(a) "western Indiana" (Par. 7)

Answer: "Western Indiana" is defined as approximately the western two-thirds to three-quarters of the State of Indiana.

(b) "western Kentucky" (Par. 7)

Answer: "Western Kentucky" is defined as approximately the western one-half of the Commonwealth Kentucky.

(c) "western Tennessee" (Par. 7)

Answer: "Western Tennessee" is defined as approximately the western one-third to one-half of the State of Tennessee.

(d) "eastern Missouri" (Par. 7)

Answer: "Eastern Missouri" is defined as approximately the eastern one-third to one-half and the south central portion of the State of Missouri.

(e) "eastern Iowa" (Par. 7)

Answer: "Eastern Iowa" is defined as approximately the eastern one-half to two-thirds of the State of Iowa.

(f) "southwestern and central Wisconsin" (Par. 7)

Answer: "Southwestern and central Wisconsin" is defined as approximately the entire State of Wisconsin with the exception of the eastern one-quarter to one-third of the State which is situated to the west of Lake Michigan and with the exception of the northwest portion of Wisconsin which is situated to the south of Lake Superior.

(g) "southeastern Minnesota" (Par. 7)

Answer: "Southeastern Minnesota" is defined as approximately the southeastern quarter of the State of Minnesota and includes, principally, the cities of St. Paul and Minneapolis and their environs.

* * *

(j) "coal reserves which can be recovered" (Par. 9)

Answer: This phrase means coal reserves which can be mined, that is "recovered," under present and future technological capabilities.

* * *

Interrogatory 6

Does plaintiff contend that there are other appropriate "sections of the country" (within the meaning of Section 7 of the Clayton Act) within which to test the legality of the challenged acquisitions of UEC stock? If so, specifically define each such area and state the facts and identify the data upon which plaintiff relies in supporting each such contention.

Answer: The plaintiff does not at this time contend that there are other appropriate sections of the country within which to test the legality of the acquisition of UEC by GD.

Interrogatory 7

With reference to Paragraph 8 of the Complaint, for each "section of the country" designated by plaintiff as "appropriate" in answer to Interrogatories 4 through 6, state which, if any, of the following fuels plaintiff contends do not compete with bituminous coal in such "section of the country" in "providing a dependable and low cost source of energy," and state the facts and identify the data upon which plaintiff relies in supporting such contention:

(a) Gas
(b) Oil
(c) Nuclear energy
(d) Lignite
(e) Water

Answer: The answer to this question is now being investigated by the plaintiff. However, the plaintiff directs the defendants' attention to the Keystone Coal Buyers Manual 1967, at pages 243-248, 250, 254-258, 269 and 273-274, and to the National Coal Association's Bituminous Coal Facts 1966, at pages 85-87 and 90.

Interrogatory 8

Does plaintiff contend that the "Eastern Interior Coal Province sales area" is an area anywhere within which coal mined at any location in the Eastern Interior Coal Province is able to compete with coal mined at any other location in the Eastern Interior Coal Province?

(a) If so, state the facts and identify the data upon which plaintiff relies in supporting this contention.

Answer: The plaintiff contends "that approximately 80 per cent of the bituminous coal consumed in the Eastern Interior Coal Province sales area was produced in the Eastern Interior Coal Province." In support of this allegation, the answer to Interrogatory 3(c), above, is herein fully incorporated.

(b) If plaintiff does not so contend, for each of the mines in Illinois, Indiana and Kentucky listed in Appendix A, attached hereto,

(1) Identify every other mine in the list with which such mine does or can compete, and the name and location of customers for which such mines do or could compete.

(2) Identify every other mine in the list with which such mine does not or cannot compete.

(3) With respect to each mine in the list owned by Freeman or UEC, identify every other mine not included in the list with which plaintiff contends such Freeman or UEC mine does or can compete, and the name and location of customers for which such Freeman or UEC mine and such other mines as are named do or could compete.

(c) For each answer to Interrogatory 8(b)(1), (2) and (3), state the facts and identify the data upon which plaintiff relies in supporting its answers.

Answer: The plaintiff has at present no information in response to Interrogatory 8(b) and (c).

Interrogatories 9, 10, 11, 12, 13, 14 and 15

13. Identify the twenty largest (in terms of total tons produced from mines within Illinois) coal producers operating mines within the State of Illinois in 1967 and, for each, state total nationwide production, production from mines within the Eastern Interior Coal Province, and production from mines within the State of Illinois, all for the year 1967.

14. With reference to Paragraph 19 of the Complaint, identify all coal producers referred to in the answers to Interrogatories 9 through 13, which plaintiff contends are "leading" producers and state the facts upon which plaintiff relies in supporting each such contention.

15. With reference to Paragraph 19 of the Complaint, identify all coal producers referred to in the answers to Interrogatories 9 through 13, which plaintiff contends are not "leading" producers and state the facts upon which plaintiff relies in supporting each such contention.

Answer to Interrogatories 9, 10, 11, 12, 13, 14 and 15: The schedule entitled "REPORT OF MINE PERFORMANCE . . . JANUARY THROUGH SEPTEMBER 1966 AND 1967 FOR ILLINOIS, INDIANA AND WEST KENTUCKY, BY DISTRICTS," which was prepared by the Mid-West Coal Producers Institute, Inc., sets forth tonnage figures of the leading producers. A copy of this schedule is attached to Plaintiff's Answers to the Defendants' Interrogatories and is herein fully incorporated. Supplemental answers will be made when and if additional information is obtained.

Interrogatory 17

Does plaintiff contend in this action that any competitor of any of the defendants has been or will be adversely affected or disadvantaged in its ability to compete by reason of the challenged acquisition of UEC stock? If plaintiff so contends:

(a) Identify each such competitor and state with which defendant or defendants such competitor competes.

(b) For each competitor listed in answer to Interrogatory 17(a), describe each "line of commerce" and each "section of the country" (within the meaning of Section 7 of the Clayton Act) in which such competitor's ability to compete has been or will be adversely affected or disadvantaged.

(c) For each such competitor identified in answer to Interrogatory 17(a), state the manner in which, and the nature and extent to which such competitor's ability to compete has been or will be adversely affected or disadvantaged in each "line of commerce" and "[illegible] each section of the country" described in answer to Interrogatory 17(b).

(d) State the facts and identify the data upon which plaintiff relies in supporting its answers to Interrogatory 17(a) through 17(c).

(e) State the name, address, firm and position of each person (other than employees of plaintiff) known by plaintiff to be in possession of evidence or other information concerning any adverse effect or disadvantage which plaintiff contends the challenged acquisitions have had or will have upon any competitor of any defendant.

Answer: The plaintiff has at present no information in response to Interrogatory 17(a)-(e).

Interrogatory 18

State the name, address, firm and position of each officer or employee of any competitor of any defendant interviewed or inquired of by plaintiff or on plaintiff's behalf who has advised that his firm:

(a) Has been adversely affected or disadvantaged in its ability to compete by reason of the challenged acquisitions of UEC stock.

(b) Has not been adversely affected or disadvantaged in its ability to compete by reason of the challenged acquisitions of UEC stock.

(c) Will be adversely affected or disadvantaged in its ability to compete by reason of the challenged acquisitions of UEC stock.

(d) Will not be adversely affected or disadvantaged in its ability to compete by reason of the challenged acquisitions of UEC stock.

Answer: The plaintiff has at present no information in response to Interrogatory 18(a), (c) and (d). The plaintiff's response to Interrogatory 18(b) is as follows:

1. On October 12, 1966, John T. Cusack was informed by H. B. Lee, vice president-sales, Peabody Coal Company, 301 North

Memorial Drive, St. Louis, Missouri, that the acquisition of UEC by GD will probably have no effect on the competitive position of Peabody. In regard to the competitive position of Peabody please see United States v. Peabody Coal Company et al., Civil Action No. 67 C 1621 (N.D. Ill.), and the Final Judgment entered on October 23, 1967.

2. On October 11, 1966, John T. Cusack was informed by W. B. Buchanan, Jr., president of Old Ben Coal Corporation, 10 South Riverside Plaza, Chicago, Illinois, that he did not feel that UEC's acquisition by GD would harm his company.

3. On October 10, 1966, John T. Cusack was informed by Henry C. Woods, president of Sahara Coal Co., Inc., 59 East Van Buren Street, Chicago, Illinois, that he was not concerned about UEC's acquisition by GD.

Interrogatory 20

With reference to Paragraph 20 of the Complaint, state the date after which plaintiff contends UEC and Freeman were no longer "direct and substantial competitors in the sale of bituminous coal" and state the facts and identify the data upon which plaintiff relies in supporting its contention.

Answer: The plaintiff has at present no information in response to this Interrogatory other than to state that on August 4, 1967, Frank Nugent, then president of UEC and Freeman, stated in Washington, D.C. to officials of the United States Department of Justice, Antitrust Division, that in 1966 GD obtained managerial control of UEC. The plaintiff further notes that by December of 1966 GD had acquired at least 90% of the outstanding shares of UEC and shortly thereafter UEC became a wholly owned subsidiary of GD.

Interrogatory 21

With reference to Paragraph 20 of the Complaint, does plaintiff contend that all of the approximately 53% of Freeman's dollar sales and the approximately 61% of UEC's dollar sales which are alleged to have been to the same customers in 1965 were sales that were made, or could have been made, in competition with each other?

(a) If plaintiff does not so contend, identify, by name and location of customer, location of receiving plants and tonnage involved, which of such sales were made, or could have been made, in competition with each other.

(b) If plaintiff does not so contend, identify, by name and location of customer, location of receiving plants and tonnage involved, which of such sales were not made, or could not have been made, in competition with each other.

(c) State the facts and identify the data upon which plaintiff relies in supporting its answers to Interrogatory 21, and, if answered, Interrogatories 21(a) and 21(b).

Answer: The plaintiff has at present no information in response to Interrogatory 21.

Interrogatory 23

State the name, address, firm and position of each officer or employee of any customer of any defendant interviewed or inquired of by plaintiff or on plaintiff's behalf who has advised that his firm:

(a) Has, by reason of the challenged acquisitions of UEC stock, been deprived of actual competition between Freeman and UEC.

(b) Will, by reason of the challenged acquisitions of UEC stock, be deprived of actual competition between Freeman and UEC.

(c) Has not considered Freeman and UEC as actual competitors. In addition, for each person identified, state the reasons given, if any, why such person so advised.

(d) Has, by reason of the challenged acquisitions of UEC stock, been deprived of potential competition between Freeman and UEC.

(e) Will, by reason of the challenged acquisitions of UEC stock, be deprived of potential competition between Freeman and UEC.

(f) Does not consider Freeman and UEC as potential competitors. In addition, for each person identified, state the reasons given, if any, why such person so advised.

Answer: The plaintiff has no information at this time in response to Interrogatory 23(a)-(f).

Interrogatory 26

With reference to Paragraph 23(c) of the Complaint, does plaintiff contend that as a result of the challenged acquisitions of UEC stock there has been an increase in concentration in the production and sale of bituminous coal among companies other than defendants? If so, describe the nature and extent of such increased concentration, identify the companies involved, and the manner by which the challenged acquisitions of UEC stock increased such concentration. In addition, identify the data upon which plaintiff relies in supporting its answer.

Answer: The plaintiff has at present no information in response to Interrogatory 26.

Interrogatory 27

With reference to Paragraph 23(c) of the Complaint, does plaintiff contend that the challenged acquisitions of UEC stock may increase concentration in the production and sale of bituminous coal beyond the increase in concentration, if any, which would occur if UEC and Freeman were one company? If so, state the facts and identify the data upon which plaintiff relies in supporting such contention.

Answer: The plaintiff has at present no information in response to Interrogatory 27.

Interrogatory 30

With respect to the allegation in Paragraph 19 of the Complaint that "the bituminous coal industry is highly concentrated among the leading producers due in large part to mergers" describe what other causes there have been for the alleged degree of concentration.

Answer: The plaintiff has at present no information in response to Interrogatory 30.

Interrogatory 37

Does plaintiff contend in this action that the election to the Board of Directors of UEC on October 30, 1959, of representatives of Material Service Corporation and Freeman Coal Mining Corporation had any effect upon competition in any "line of commerce" in any "section of the country" (within the meaning of Section 7 of the Clayton Act)?

(a) If so, state the manner, nature and extent of such effect on competition.

(b) If so, state the name, address, firm and position of each person (other than employees of plaintiff) known by plaintiff to be in possession of evidence or information concerning the matters set forth in plaintiff's answer to Interrogatory 37(a).

Answer: The plaintiff does not know the answer to this Interrogatory at this time.

Interrogatory 44

Does plaintiff contend that UEC can, at the present time, purchase additional coal reserves (other than abutting or fill-in acreage) recoverable through strip mining

operations within those reserves identified in response to Interrogatory 42? If so, state their location by County and State and, for each field of reserves by County, state:

(a) Their exact location.

(b) The coal seam or seams involved and the amount (in tons) recoverable from each seam.

(c) The average overburden covering such reserves.

(d) The average seam thickness of such reserves.

(e) The average overburden to seam thickness ratio of such reserves.

(f) The average sulphur content (in percent) of such reserves.

(g) The average ash content (in percent) of such reserves.

(h) The average moisture content (in percent) of such reserves.

(i) The average BTU rating of such reserves.

(j) The party or parties from whom they can be acquired.

(k) The approximate cost (in dollars) of acquisition.

(l) Which, if any, present or potential customers of UEC could be served by such reserves.

(m) Which, if any, present or potential customers of Freeman could be served by such reserves.

Answer: The answer to Interrogatory 42, above, is herein fully incorporated.

Interrogatory 45

Since, 1959, has any coal producer in Illinois, Indiana or Kentucky acquired or gained control of a new field of coal reserves mineable by stripping operations and exceeding

10,000,000 tons when assembled, excluding reserves so obtained by way of merger or combination with another coal producer? If so, for each such field of reserves state:

(a) The name of the producer involved.

(b) The date of such acquisition or control.

(c) The exact location of such reserves and the amount (in tons) of coal recoverable.

Answer: The plaintiff does not know the answer to this Interrogatory at this time.

Interrogatory 46

Does plaintiff contend that UEC can mine its Industry Field strip reserves in Illinois and competitively market the coal produced? If so, state:

(a) The approximate time by which such mining could be undertaken.

(b) Which, if any, present or potential customers of UEC could be served by such coal.

(c) Which, if any, present or potential customers of Freeman could be served by such coal.

Answer: The plaintiff does not know the answer to this Interrogatory at this time.

Interrogatory 50

Does plaintiff contend that UEC's competitive viability can be determined without reference to:

(a) The amount of coal reserves presently owned or controlled by UEC.

(b) The amount of coal reserves already committed to existing coal supply contracts.

(c) The geographic location of the coal reserves presently owned or controlled by UEC.

(d) The average sulphur content of such reserves.

(e) The average ash content of such reserves.

(f) The average moisture content of such reserves.

(g) The average BTU rating of such reserves.

(h) The nature of coal supply contracts required by utilities -- including both the length of the contracts and the annual coal requirements of such contracts.

(i) Whether or not UEC is able to compete for said coal supply contracts or utilities.

(j) The annual production capacity of UEC's present mines.

(k) Present and future air pollution legislation.

(l) Nuclear energy as an alternative energy source to coal.

(m) Other alternative energy sources to coal.

Answer: The plaintiff does not know the answers to Interrogatory 50(a)-(m) at this time.

Interrogatory 51

With respect to each utility presently purchasing coal produced in Illinois, state the amount (in tons) of uncommitted reserves which a coal producer must own or control and the total tons of coal which a coal producer must be able to produce annually in order to compete for the coal supply contracts of such utility.

Answer: The plaintiff does not know the answer to this Interrogatory at this time.

Interrogatory 54

Identify each coal producer known to plaintiff to have, without merger or combination with another coal producer with underground mining experience, undertaken underground mining operations within the last 40 years despite the fact that, prior thereto, such coal producer had not engaged in underground mining operations, and for each such producer, state:

(a) The date of undertaking such underground mining operations.

(b) The location of such underground mining operations.

Answer: The plaintiff does not know the answer to this Interrogatory at this time.

GENERAL DYNAMICS CORPORATION; THE UNITED ELECTRIC COAL COMPANIES; and FREEMAN COAL MINING CORPORATION,	)	
	)	
Defendants.	)	

PLAINTIFF'S AMENDED ANSWERS TO INTERROGATORIES OF THE DEFENDANTS

Interrogatory 20

With reference to Paragraph 20 of the Complaint, state the date after which plaintiff contends UEC and Freeman were no longer "direct and substantial competitors in the sale of bituminous coal" and state the facts and identify the data upon which plaintiff relies in supporting its contention.

Answer: In addition to the plaintiff's answer to Interrogatory 20 as set forth in the Answers to Interrogatories of the Defendants, which was served and filed on March 15, 1968, the plaintiff states that Freeman Coal Mining Corporation ("Freeman") and The United Electric Coal Companies ("UEC"), if separately owned, would be actual and potential competitors based on the following facts:

(1) Each produces bituminous coal in the same geographic areas;

(2) Each advertises its coal for sale to the same type of customers, which customers are located in the same geographic areas in which Freeman and UEC produce and sell coal;

(3) Each negotiates and bids for some of the same sales of coal;

(4) Each sells to industrial and to utility customers which are located in the same geographic areas;

(5) Each sells its coal to many of the same customers;

(6) Each uses many of the same shipping routes for the shipment of the coal it produces and sells.

The data in support of the foregoing statements are as follows:

(1) Keystone Coal Buyers Manual 1967 (McGraw-Hill, Inc., New York, N.Y.) has, at page 417, a full page advertisement of UEC, a copy of which is attached. This advertisement states, in part, that "UNITED ELECTRIC COALS for ELECTRIC UTILITIES and BASIC INDUSTRIES" are available "BY BARGE on the Inland Waterways,"

"BY LAKE VESSEL to Great Lakes Ports," "BY RAIL to all Middle West Points" and "BY TRUCK for Local Area Delivery."

(2) Keystone Coal Buyers Manual 1967 has, at page 423, a full page advertisement of Freeman, a copy of which is attached. This advertisement states, in part, that Freeman Coal is "distinguished for their basic character and excellent preparation for electric utility, industrial, metallurgical and heating uses."

(3) Keystone Coal Buyers Manual 1967 has, at page 49, a full page advertisement of Freeman, a copy of which is attached. This advertisement states, in part, that "For generating electricity . . . There's a Freeman coal that's exactly right for the job."

(4) The above three advertisements in the Keystone Coal Buyers Manual 1967 are also set out in the Keystone Coal Buyers Manual 1966 at pages 439, 431, and 67.

(5) Keystone Coal Buyers Manual 1967, at pages 418 and 420. These pages show, inter alia, that the Fidelity Mine of UEC ships coal on the Illinois Central and on the Missouri Pacific Railroads, while the Orient No. 3 Mine

of Freeman ships coal on Missouri Pacific, Illinois Central and Chicago Burlington & Quincy Railroads.

We note that the shipping point for the Fidelity Mine is Pinckneyville, Illinois, while the shipping point for the Orient No. 3 Mine is the Mine. The Illinois State Geological Survey map entitled "SHIPPING COAL MINES IN ILLINOIS," which is dated January 1, 1966, shows that the Orient No. 3 Mine is less than one mile from the Missouri Pacific rail line and that at this point the Orient No. 3 Mine is about 20 miles from Pinckneyville, the shipping point for UEC's Fidelity Mine on the same rail line of the Missouri Pacific.

Keystone Coal Buyers Manual 1967 also shows, at page 418, that Freeman's Orient No. 4 Mine and Orient No. 5 Mine also ship on, among others, the Missouri Pacific and the Illinois Central Railroads.

(6) Letter from Illinois Power Company dated October 17, 1966. This letter has an attachment showing, among other things, that in 1964 Freeman and UEC both supplied coal (and, hopefully, in competition) to the Illinois Power Co. plants located in Vermilion and Wood River, and that in

1965 Freeman and UEC both supplied coal to the Illinois Power Co. plant at Vermilion. Furthermore, this letter from Illinois Power Co. states, in pertinent part, that:

> Both United Electric Coal Companies and Freeman Coal Mining Corporation have bid on supplying coal to our company. Other area coal suppliers also having bid for these requirements has satisfied us that the two named companies you have questioned have in fact held themselves out to be competitors.

(7) A Dun & Bradstreet "Analytical Report" on UEC dated June 8, 1966 states, at page 6, that UEC's sales "are made through the company's own sales organization largely to the utilities and heavy industries" and that UEC's "territory" is "Chicago, St. Louis and other industrial sections within easy shipping distance of the mines" and that "sales offices are maintained at St. Louis, Missouri and Peoria, Illinois, [and] also various other sales offices and distribution or service points [are maintained] at other locations."

A Dun & Bradstreet "Analytical Report" on Freeman dated November 11, 1966, states that Freeman's territory

is "largely the middle western states" and that Freeman's "sales offices are maintained in St. Louis, Missouri and Springfield, Illinois."

Freeman and UEC also both maintained separate sales offices in Chicago, Illinois.

(8) Letter from Central Illinois Public Service Company dated October 28, 1966. This letter states, inter alia, that:

> For many years it has been our practice to negotiate on an individual basis the terms of our coal purchases from our several coal suppliers. Several factors are considered in our coal purchasing decisions. Among these factors are: type of product (dust, screenings, carbon, etc.), BTU content, cost per million BTU (F.O.B. generating plant), sulfur and other impurities content, moisture content, amount of resulting ash, etc. Based upon the application of such factors, our coal purchases from Freeman Coal Mining Corporation and The United Electric Coal Companies have resulted in these two companies being among the principal suppliers of coal to two of our four electric generating stations (no coal is purchased from either company for use at our other two generating stations). In 1964 Freeman provided 24.8 percent and United Electric 2.9 percent of the total coal requirements at one of the generating stations, while at the other generating station the amounts were 12.3 percent and 23.8 percent, respectively. Similarly, in 1965 the relationships were 22.2 percent for Freeman and 3.0 percent for United Electric at the first station and 12.1 percent and 26.5 percent, respectively, for the second station. All factors considered, we have found the two companies to be competitive.

(9) Both Freeman and UEC own a substantial portion of Rail-To-Water Transfer Corporation, a firm which is engaged in the transfer of coal from railroad cars to vessels transporting coal on Lake Michigan.

The gradual acquisition of all of UEC's stock by the owners of Freeman commencing in 1955 and completed about December of 1966, or shortly thereafter, eliminated both actual and potential competition between Freeman and UEC. Plaintiff does not know the date within the period of gradual acquisition of UEC stock when Freeman and UEC were no longer direct and substantial competitors in the sale of coal.

Interrogatory 21

With reference to Paragraph 20 of the Complaint, does plaintiff contend that all of the approximately 53% of Freeman's dollar sales and the approximately 61% of UEC's dollar sales which are alleged to have been to the same customers in 1965 were sales that were made, or could have been made, in competition with each other?

(a) If plaintiff does not so contend, identify, by name and location of customer, location of receiving plants and tonnage involved, which of such sales were made, or could have been made, in competition with each other.

(b) If plaintiff does not so contend, identify, by name and location of customer, location of receiving plants and tonnage involved, which of such sales were not made, or could not have been made, in competition with each other.

(c) State the facts and identify the data upon which plaintiff relies in supporting its answers to Interrogatory 21, and, if answered, Interrogatories 21(a) and 21(b).

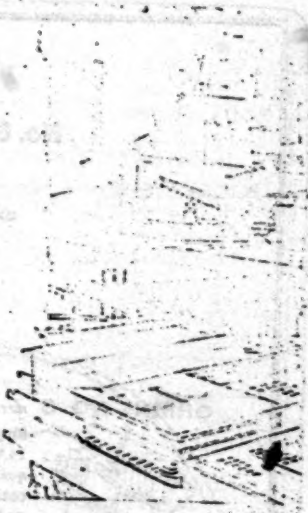
Answer: Plaintiff contends that Freeman and UEC, if separately owned in 1965, could have competed with each other in substantial sales to the same customers. Plaintiff does not know of any specific sales to any specific customers which were made in 1965 which could not have been made by Freeman and UEC in competition with each other.

BY BARGE on the Inland Waterways

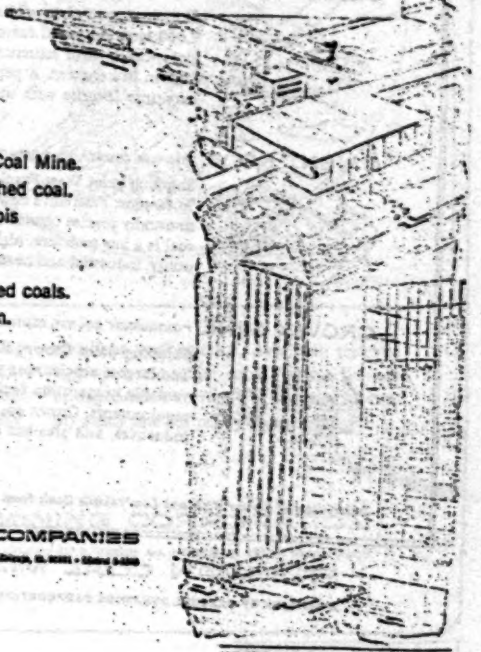
BY LAKE VESSEL to Great Lakes Ports

BY RAIL to all Middle West Points

BY TRUCK for Local Area Delivery



UNITED ELECTRIC COALS for ELECTRIC UTILITIES and BASIC INDUSTRIES



BANNER – Direct Barge-Loading Coal Mine.
Premium quality heavy media washed coal.
Bannar Seam, Peoria County, Illinois

CUBA-BUCKHEART
Heavy media, washed and heat dried coals.
Fulton County, Illinois, No. 5 Seam.

FIDELITY
Washed and heat dried coals.
Perry County, Illinois, No. 6 Seam.

THE UNITED ELECTRIC COAL COMPANIES
A SUBSIDIARY OF GENERAL DYNAMICS CORPORATION/[illegible]

Deep Mined Coals from No. 6 Seam in Southern and Central Illinois

distinguished for their basic character and excellent preparation for electric utility, industrial, metallurgical and heating uses

ORIENT NO. 3
JEFFERSON COUNTY, SOUTHERN ILLINOIS

Shipping point Orient Mine No. 3, Illinois. Daily capacity 14,000 tons. One of the largest mines in the country. Famed for quality and excellence of preparation. The lowest ash low sulphur coal in Illinois for metallurgical, electric utility, industrial and heating applications. Extensive reserves.

ORIENT NO. 4
WILLIAMSON COUNTY, SOUTHERN ILLINOIS

Shipping point Orient Mine No. 4, Illinois. Daily capacity 7,000 tons. A special feature of this mine is its attractive glossy-black, firm structure coal, unusually low in moisture and high in Btu content. A popular dealer coal as well as a long-time favorite with utilities and industries.

ORIENT NO. 5
FRANKLIN COUNTY, SOUTHERN ILLINOIS

Shipping point West Frankfort, Illinois. Daily capacity 7,000 tons. Freeman's newest mine, highly automated for unusually precise control of both quality and sizing. Orient No. 5 coal is a low moisture, high Btu product, highly desirable for utility, industrial and heating uses.

CROWN MINE
MONTGOMERY COUNTY, CENTRAL ILLINOIS

Shipping point Crown, Illinois. Daily capacity 10,000 tons. The largest air-cleaning plant in the country plus unusually versatile preparation facilities capable of meeting varied market requirements. Crown coal is widely used by utilities and industries, and also has a large and loyal dealer following.

Distributors of Choice High and Low Volatile Coals from Eastern Kentucky and West Virginia

FREEMAN COAL MINING CORPORATION

A DIVISION OF GENERAL DYNAMICS CORPORATION / 327 S. Michigan Ave. • Chicago, Ill. 60601 • ANdover 3-2800

If you are generating electricity, or doing any industrial power or heating job with coal, use a product of the Freeman mines in Illinois . . . for quality and consistently excellent performance. Available reserves aggregate one billion tons. You can be sure of dependable service and security of supply today and for many years to come.

PLAINTIFF'S FIRST SUPPLEMENTAL ANSWERS TO INTERROGATORIES OF THE DEFENDANTS

Interrogatory 7

With reference to Paragraph 8 of the Complaint, for each "section of the country" designated by plaintiff as "appropriate" in answer to Interrogatories 4 through 6, state which, if any, of the following fuels plaintiff contends do not compete with bituminous coal in such "section of the country" in "providing a dependable and low cost source of energy," and state the facts and identify the data upon which plaintiff relies in supporting such contention:

(a) Gas
(b) Oil
(c) Nuclear energy
(d) Lignite
(e) Water

Answer: None of the above fuels compete substantially with bituminous coal in the sections of the country which are appropriate to this lawsuit as set out in the answers to Interrogatories 4-6. In answer to this Interrogatory plaintiff relies on Kurtz

deposition exhibits 1-8, 9 (at pages 86-90) and 10 (at pages 73-77) and the following deposition testimony together with the exhibits marked therein: deposition testimony of Thomas J. Tarzy at pages 16-18, 315-317, 319, 320-327; deposition testimony of Joseph J. Gallagher (no transcript pages available); deposition testimony of Nicholas J. Camicia at pages 100-102; deposition testimony of John M. Morris at pages 297-299 (and Morris deposition exhibit 70); and deposition testimony of Frank F. Kolbe at page 85 and pages 164-166.

Interrogatory 8

Does plaintiff contend that the "Eastern Interior Coal Province sales area" is an area anywhere within which coal mined at any location in the Eastern Interior Coal Province is able to compete with coal mined at any other location in the Eastern Interior Coal Province?

(a) If so, state the facts and identify the data upon which plaintiff relies in supporting this contention.

Answer: Coal mined anywhere in the Midwest Coal Field (Eastern Interior Coal Province) is in competition, direct or indirect, with all other coal mined in said area, for sales in the Eastern Interior Coal Province sales area as defined in the Complaint. The answers to Interrogatories 3(c) and 19 are herein fully incorporated. In further support of this answer the

Government relies on the deposition testimony of Charles W. Stadell at pages 35-36 of December 16, 1968 (no transcript pages available) and the deposition testimony of Nicholas J. Camicia at pages 77-78 and pages 107-133.

Interrogatory 13

Identify the twenty largest (in terms of total tons produced from mines within Illinois) coal producers operating mines within the State of Illinois in 1967 and, for each, state total nationwide production, production from mines within the Eastern Interior Coal Province, and production from mines within the State of Illinois, all for the year 1967.

Answer:

Name	Nationwide Production	Eastern Int. Coal Province Production [1]	State of Illinois Production [2]
1. Peabody Coal Co. (including Midland Electric Coal Corp., Forsythe Energy Coal Co. and Stonefort Coal Mining Co., Inc.)	NA	42,546,199	20,158,284 [3]
2. Freeman Coal Mining Corp. (Subsidiary of General Dynamics)	NA	8,380,496	8,380,496
3. Southwestern Illinois Coal Corp.	NA	7,526,586	7,526,586
4. Truax-Traer Coal Co. (Subsidiary of Consolidated Coal Co.)	NA	6,906,344	6,906,346 [4]
5. Old Ben Coal Corp.	NA	9,457,647	5,989,539
6. The United Electric Coal Companies	NA	5,743,098	5,743,291 [5]

1/ Source: "Report of Mine Performance . . . January through December 1966 and 1967 for Illinois, Indiana, and West Kentucky, by Districts" published by Mid-West Coal Producers Institute, Inc. (Terleke deposition exhibit 11).

19.	Harrisburg Coal Co.	NA	NA	75,589
20.	Parton Coal Co.	NA	NA	65,545

6/ Mid-West Institute figure is 1 ton more.

7/ Mid-West Institute figure is 273,019 tons more.

8/ Mid-West Institute figure is 228 tons less.

Interrogatory 14

With reference to Paragraph 19 of the Complaint, identify all coal producers referred to in the answers to Interrogatories 9 through 13, which plaintiff contends are "leading" producers and state the facts upon which plaintiff relies in supporting each such contention.

Answer: The answer to Interrogatory 13 is herein fully incorporated. In support of this contention the plaintiff relies on its answers to Interrogatories 3(c), 8 and 19.

Interrogatory 15

With reference to Paragraph 19 of the Complaint, identify all coal producers referred to in the answers to Interrogatories 9 through 13, which plaintiff contends are not "leading " producers and state the facts upon which plaintiff relies in supporting each such contention.

Answer: The only producers which plaintiff contends are not leading producers as set out at answers to Interrogatories 9 through 13 are those which are no longer producing coal. The plaintiff herein fully incorporates its answer to Interrogatory

Interrogatory 20

With reference to Paragraph 20 of the Complaint, state the date after which plaintiff contends UEC and Freeman were no longer "direct and substantial competitors in the sale of bituminous coal" and state the facts and identify the data upon which plaintiff relies in supporting its contention.

Answer: The plaintiff does not know the answer to this Interrogatory. Competition between UEC and Freeman gradually lessened as General Dynamics increased its stock ownership in UEC.

Interrogatory 21

With reference to Paragraph 20 of the Complaint, does plaintiff contend that all of the approximately 53% of Freeman's dollar sales and the approximately 61% of UEC's dollar sales which are alleged to have been to the same customers in 1965 were sales that were made, or could have been made, in competition with each other?

(a) If plaintiff does not so contend, identify, by name and location of customer, location of receiving plants and tonnage involved, which of such sales were made, or could have been made, in competition with each other.

(b) If plaintiff does not so contend, identify, by name and location of customer, location of receiving plants and tonnage involved, which of such sales were not made, or could not have been made, in competition with each other.

(c) State the facts and identify the data upon which plaintiff relies in supporting its answers to Interrogatory 21, and, if answered, Interrogatories 21(a) and 21(b).

Answer: The plaintiff does contend that all of the sales of Freeman and all of the sales of UEC in 1965 could have been made in competition with each other, with the exception of Freeman's sales of metallurgical coal. In support of this fact, the plaintiff relies on the testimony of the United Electric's present and former officers as set out in our answer to Interrogatory 19. The plaintiff also points out that Frank Hugent testified that

(at page 361):

> A The competitors of the Freeman Coal Mining Corporation on southern Illinois coal are those producers in southern Illinois, western Kentucky and Indiana, and to a degree producers in the Belleville District.
>
> Competitors of Freeman in central Illinois are producers in central Illinois and Fulton County, and to a limited extent coals from other fields that can reach Edison's market.

Furthermore, Frank F. Kolbe testified that UEC and Freeman were competitors (at pages 164-166).

Charles W. Stadell also testified on December 16, 1968, that coal mined in all of the freight rate districts in Mining Districts 9, 10 and 11 have shipped and could ship coal into the Chicago metropolitan area, (transcript reference page not available) at pages 35-36.

See also Morris deposition testimony, at pages 299-304. See also answers to Interrogatories 19-20, 22-24.

Interrogatory 27

> With reference to Paragraph 23(c) of the Complaint, does plaintiff contend that the challenged acquisitions of UEC stock may increase concentration in the production and sale of bituminous coal beyond the increase in concentration, if any, which would occur if UEC and Freeman were one company? If so, state the facts and identify the data upon which plaintiff relies in supporting such contention.

Answer: It may be inferred that if the Freeman-UEC combination is not dissolved, other such illegal mergers may be attempted.

Interrogatory 44

Does plaintiff contend that UEC can, at the present time, purchase additional coal reserves (other than abutting or fill-in acreage) recoverable through strip mining operations within those reserves identified in response to Interrogatory 42? If so, state their location by County and State and, for each field of reserves by County, state:

(a) Their exact location.

(b) The coal seam or seams involved and the amount (in tons) recoverable from each seam.

(c) The average overburden covering such reserves.

(d) The average seam thickness of such reserves.

(e) The average overburden to seam thickness ratio of such reserves.

(f) The average sulphur content (in percent) of such reserves.

(g) The average ash content (in percent) of such reserves.

(h) The average moisture content (in percent) of such reserves.

(i) The average BTU rating of such reserves.

(j) The party or parties from whom they can be acquired.

(k) The approximate cost (in dollars) of acquisition.

(l) Which, if any, present or potential customers of UEC could be served by such reserves.

(m) Which, if any, present or potential customers of Freeman could be served by such reserves.

Answer: Yes. The location of these coal reserves are as follows:

1. Augusta Field, located approximately ten miles west of the Industry Field, contains approximately 10 million tons of coal. Source: Inman deposition pages 53, 55 and 161.

2. Meredosia - Mount Sterling area, located in Brown County, Illinois, contains 30 million tons between 100 and 150 feet of overburden and five million tons beneath less than 100 feet of overburden. Source: Inman deposition pages 59-60.

3. Tazewell County, Spring Lake Township area, located directly south of the Banner Mine across the Illinois River, contains 5,000,000 tons of coal. Source: Inman deposition pages 60, 61 and 161.

4. Salt Fork Field, located near Catlin, Illinois, four miles from the Mary Moore Mine, contains 35,000,000 tons beneath overburden ranging from 60 to 150 feet and 150 feet to 200 feet deep. Source: Inman deposition pages 63-70.

5. Fidelity Mine contains 5,000,000 tons of coal classified as deep coal but which possibly may be stripped. The coal is six

feet thick and is beneath overburden ranging from 80 feet to 125 feet deep. Source: Inman deposition pages 112, 114 and 115.

6. Industry Field contains an additional one to two million tons which UEC could acquire. Source: Inman deposition page 162.

7. There may be additional reserves at UEC's present mines which reserves are unknown to UEC at the present time. For example, Mary Moore was operated longer than anticipated. Source: Inman deposition page 72 (substantiated by the deposition testimony of John M. Morris at pages 38-58 and Frank F. Kolbe at pages 230-231).

8. Due south of the Industry Field, toward the town of Bushville, Illinois, there are coal reserves. Source: Inman deposition page 186.

In addition to the foregoing, plaintiff contends that there is a probability UEC may be able to acquire additional coal reserves (other than those abutting present reserves and "fill-in" acerage) recoverable through strip mining operations. In support of this contention, and of areas 1 through 8 above, the plaintiff also relies on the deposition testimony of Burl Jensen at the following pages (together with the exhibits identified and/or discussed therein): 118-137, 171-178, 183-215, 216-226, 258-268 and 271 and the deposition testimony of Thomas H. Latimer at the

following pages (together with the exhibits identified and/or discussed therein): 71-82, 84-87, 92-96, 412-413, 101-106, 108-117, 129-133, 137-140, 140-141, 141-147, 147-153, 153-155, 159-167, 178-186, 190-193, 223-295, 205-213, 295-310, 311-319, 319-326, 326-328, 324-350, 354-356, 366-369, 350-354, 358-366, 370-373, 373-375. In further support of the above see Morris deposition exhibit 12.

Interrogatory 46

Does plaintiff contend that UEC can mine its Industry Field strip reserves in Illinois and competitively market the coal produced? If so, state:

(a) The approximate time by which such mining could be undertaken.

(b) Which, if any, present or potential customers of UEC could be served by such coal.

(c) Which, if any, present or potential customers of Freeman could be served by such coal.

Answer: The plaintiff contends that the Industry Field can be mined at a profit by a competent and unfettered management. The plaintiff does not know at what time this could take place but Robert H. Inman, former Vice President - Operations of UEC, testified that the Industry Field possibly may be mined after the Fulton County reserves of United Electric are exhausted.

Source: Inman deposition at page 162.

In further support of the profitable minability of the Industry Field the plaintiff relies on the deposition testimony of Frank F. Kolbe, former President of UEC and Chairman of the UEC Board of Directors at pages 208-230, 253-259, 268-271, 772-800, 807-813, 813-818.

In further support of the profitable minability of the Industry Field the plaintiff relies on the deposition testimony of John M. Morris, the former President of UEC, at pages 144-187 (and Morris deposition exhibits 21-31) and the testimony of Thomas J. Latimer, Land Manager of UEC, at pages 427-428, 354-356, 366-369 and 459-462 (and Latimer deposition exhibit 47).

Interrogatory 54

Identify each coal producer known to plaintiff to have, without merger or combination with another coal producer with underground mining experience, undertaken underground mining operations within the last 40 years despite the fact that, prior thereto, such coal producer had not engaged in underground mining operations, and for each such producer, state:

(a) The date of undertaking such underground mining operations.

(b) The location of such underground mining operations.

Answer: The plaintiff believes that Ayrshire Collieries Corp., Indianapolis, Indiana, is at least one strip coal producer which has undertaken underground mining without merger or combination with another coal producer. This mine is known as the Thunderbird Mine and it is located in the Linton Freight Rate District in Indiana. See deposition testimony of Frank F. Kolbe at pages 139-140 and Terleke deposition exhibit 11.

May 29, 1969

Reuben L. Hedlund, Esq.
Kirkland, Ellis, Hodson,
Chaffetz & Masters
Prudential Plaza
Chicago, Illinois 60601

Re: United States v. General Dynamics Corporation et al., Civil Action No. 67 C 1632 (N.D. Illinois)

Dear Mr. Hedlund:

This letter is in reply to your letter to us of January 24, 1969, reporting on our conference of January 17, 1969 when we discussed plaintiff's answers to the defendants' interrogatories. The numbering below corresponds to the numbering of the defendants' interrogatories. We have considered your questions and requests and the following are our comments and responses:

1(l). The "industrial customers" of Freeman referred to in paragraph 14 of the complaint was based on computations made from the statement setting forth the names and addresses of the twenty-five largest customers of Freeman for the year 1965, together with the total dollar amounts and tonnages of coal sold to each of these customers during 1965, which material was sent to us by Benjamin Z. Gould, Esq., then counsel for General Dynamics, by letter dated November 11, 1966.

1(n). Our answer to this interrogatory is revised to substitute the word "means" for the words "refers to the fact."

1(q). We believe that our answer to this interrogatory is clear and adequate.

2(b). This phrase is, we believe, clear and adequate and refers to the allegation in paragraph 16 of our complaint that in 1965 the combination of GD and UEC ranked as the second largest seller of bituminous coal in Illinois regardless of the States in which coal sold in Illinois was mined by any seller.

2(c). We believe that our answer to this interrogatory is clear and adequate and refers to the allegation in paragraph 18 of our complaint that in 1965 the combination of GD and USC ranked as the second largest seller of bituminous coal in the Eastern Interior Coal Province sales area regardless of the States in which coal sold in such area was mined by any seller.

3(c). In essence, D. W. Buchanan, Jr., Charles W. Stedell, Elmer C. Hill, Warren F. Wurzburg, Harry Eggert and the unidentified geologist from Paul Weir & Company stated that the Eastern Interior Coal Province sales area is recognized in the industry as the principal area where Eastern Interior Coal Province coal is sold.

3(f). We believe that the allegation in paragraph 9 of our complaint that "the United States now has between 830 billion and 2,000 billion tons of coal reserves which can be recovered" is a "conservative allegation," as stated in our answer to this interrogatory, because it refers to coal reserves now known or estimated by the U.S. Geological Survey and does not refer to coal reserves which have not become known or have been estimated.

3(k). We believe that this answer is correct. We estimated the 1967 Illinois coal production and obtained the coal production in Illinois from 1950 through and including 1966 from various editions of the Illinois Coal Report.

3(l). We do not know the data upon which Jack A. Simon relied in making the statements set forth in this answer. However, we note that Gallagher deposition exhibit 1, which is the Bureau of Mines report entitled "Bituminous Coal and Lignite Distribution Calendar Year 1965" states, at page 8, that in 1965 34,147,000 tons of the coal shipped to Illinois consumers were produced in Illinois and that total shipments to Illinois consumers amounted to 44,355,000 tons of coal.

3(r). In essence, Jack A. Simon told us that many mergers had occurred in the Midwest coal industry and that there are less companies operating in Illinois than formerly.

7. We believe that our answer to this interrogatory is clear and adequate and the word "substantially" is not deleted.

8(a). Our answer to this interrogatory is revised to substitute the words "actually or potentially" for the words "direct or indirect" and to add the word yes to the beginning of our answer.

14 & 15. The word "leading" used twice in paragraph 19 of our complaint is meant to be synonymous with the word "largest." The largest producers as referred to in this paragraph are set out in our answers to Interrogatory 13.

16. The information obtained by us from Southwestern Illinois Coal Corp. and Peabody and affiliates does not provide the information requested by Interrogatory 16. Southwestern's and Peabody's executives have requested that we not disclose this reserve information to defendants because to do so would create competitive harm.

19. The words "same customers" referred to in paragraph 20 of our complaint means a common customer and does not refer specifically to a facility or facilities of a customer.

20. Our position is that Freeman and UEC can no longer be actual or potential competitors because they are both owned by the same corporation, that is, by General Dynamics. They were substantial competitors when owned separately.

22(a). Our answer to this interrogatory is revised to substitute the words "and, probably, in various submarkets thereof" for the words "and in various other sections of the country."

22(b)-(e). We believe that our answers to these interrogatories are clear and adequate. The words "same customers" referred to in paragraph 20 of our complaint does not refer specifically to a facility or facilities of a customer.

24 & 25. We believe that our answers to these interrogatories are clear and adequate.

27. We believe that our answer to this interrogatory is clear and adequate.

28 & 29. Other than the allegations alleged in sub-paragraphs 23(a) through 23(c) of the complaint, General Dynamics' acquisition of UEC has been anticompetitive due to actual and potential reciprocity activities of the defendants. However, we will not adduce evidence on this subject at trial nor make it an issue in this case. In reference to vertical anticompetitive effects we await your answer to numbered paragraph 16 of our letter to you of May 23, 1969.

35, 38 & 39. We believe that our answers to these interrogatories are clear and adequate.

42 & 43. Western reserves are relevant only to the relief issues of this lawsuit.

46. We believe that our answers to this interrogatory are clear and adequate.

47. Our answer to this interrogatory is revised to include after the words "Freeman's Orient Mines" the words "and any Illinois and any Eastern Interior Coal Province sales area customers."

48. We believe that our answer to this interrogatory is clear and adequate.

This letter, and not your letter of January 24, 1969, contains our revisions to your interrogatories.

Sincerely yours,

RICHARD W. McLAREN
Assistant Attorney General

DEFENDANT'S EXHIBIT 48

EXHIBIT "A"

CHICAGO, WILMINGTON & FRANKLIN COAL COMPANY

Chicago, Illinois

December 15, 1954

To the Stockholders of

CHICAGO, WILMINGTON & FRANKLIN COAL COMPANY:

The coal mining industry has run into a series of evolutionary changes which have caused a shrinkage in demand for its product and have brought severely competitive conditions. Dieselization of the railroads, great expansion of natural gas distribution, and recent unrestricted imports of foreign residual oil which undersells coal may be mentioned. While some economic students believe that it will not be many years before coal will again have to greatly increase its output, to meet metallurgical, electrical and other expanding needs, the consensus is that our industry currently is undergoing great changes and may have several more years of difficult adjustment.

Naturally our Company has studied possible ways of improving its position. We have been invited into several tentative proposals of consolidation, but in each case the net result to our stockholders would be largely that of an exchange of their stock in our company for some other coal mining security, with no guarantee of much, if any, improvement of the character of their investment. If, on the other hand, an opportunity should present itself to sell our stock outright, at a satisfactory price for cash, that might be something of great interest.

It happens that such a suggestion was made to me earlier this year which I have worked on and developed to a point where I could discuss it with our Board of Directors. Understandably, the other party to these discussions has not yet wished to be disclosed.

I have been able to work out tentatively a quite definite proposition and have our Board's approval to present it to you and add my personal endorsement.

A price of $25.00 per share is considered to be fair and mutually satisfactory for C.W.F. stock for such a trade as I have indicated. The tentative purchaser has expressed a desire to have the undersigned, and also several of our key men, available for a period. It is my belief that this wish has added considerably to the purchaser's willingness to buy. I do not expect that any compensation I may receive for future services will be more than I would reasonably expect to receive if no sale is made, and C.W.&F. continues to operate. It is distinctly understood that I am not to receive now or to be promised any re-investment opportunity for the proceeds of any of my family stock, all of which is to be sold at $25.00 per share under the plan. I will not make any profit or commission on the Options and Proxies running to me.

In our talks on this matter we have insisted upon an equal price and treatment for every participating stockholder, more specifically a price of $25.00 per share. And of course we have also required assurances that our employe personnel will be given a fair and sympathetic opportunity for continued employment.

It is to be emphasized that the trade is contingent upon prompt participation by at least 76% of the outstanding shares, and is also contingent upon an inspection of property and a verification of balance sheet items, which it is believed can be accomplished expeditiously and in time to permit deposit in the bank of the $25.00 per share by December 31, 1954 for all shares that are deposited with the bank without delay.

I have been the head of our Company for forty years and a very large percentage of our stock is owned by my personal friends, or their widows or heirs. My own family and the Webster family are the largest ownership blocks and, with the stock owned by Stonega and a few other similar holdings, constitute a majority of our shares. It seems to me that the character of such a large part of the ownership of our Company, together with the possible opportunity to receive a satisfactory cash

price, indicates the wisdom of accepting this chance to be taken out of what may be called a "business man's investment" in coal mining.

In order to assist in carrying out this transaction, an Option and Proxy running to me and a Transmittal Letter covering stock running to The First National Bank of Chicago as escrowee were prepared. Copies are being sent to you herewith. These documents expire January 20, 1955, if not exercised on or before that date. It has been possible for me to speak with a considerable number of my friends who have assured me of their approval. In order to pursue the opportunities I needed the definite agreement of a substantial majority of our stockholders. I proceeded accordingly and I now have the Options and Proxies of the owners of such substantial majority. I am now able to send this advice to all of our stockholders.

I sincerely hope that you will accept this opportunity and act promptly. If anything is not pleasantly understandable, I will consider it a privilege to answer questions, either in person or by phone. If these proposed transactions do not come to pass, we will go ahead, confidently, "as was".

In closing I think I should give you the following interim advice on the Company's business status:

Referring to my last letter to Stockholders, in our Annual Report for 1953 dated April 28th of this year:

The first quarter of 1954 showed improvement and the Company went into the early summer with a carefully worked out operating program that gave promise of continued betterment over last year. We had reduced the working force and daily output of Orient No. 1 to about 3500, from 5000 tons, making an important per ton saving in costs by concentrating production in a small remaining section with good mining conditions. This was to be and is the last year for No. 1. We had closed down Orient No. 2 for March and April, but had thought it wise to announce re-opening for May 2nd, for by which time our contracts for Orient coal and sales outlook indicated the need for this production additional to new No. 3 and reduced No. 1. However, we ran into

bad luck on several of our largest summer customers who were closed down or were forced to severely curtail planned coal consumption, unexpectedly for painful periods, which loss of tonnage together with extremely hot weather, with many quite unusual 100 degree days in our territory, gave us a difficult summer. Having to operate the older mines on broken time was unavoidably costly.

An as yet unaudited but reliable comparison of the first 11 months of this year (November, 1954 partly estimated) with those of last shows:

1st 11 months	1954	1953
Tons sold	3,011,775	3,028,735
Gross Coal Sales	$12,318,941	$13,227,713
Net Income	1,108,764	1,277,000
Depreciation & Depletion	499,418	353,497
Final Balance (after Federal Tax)	609,346	923,503

We now estimate that net results for 1954 probably will be about $2.00 per share.

For your further information please see the following comparative condensed balance sheets at October 31, 1954 and at December 31, 1953, in accordance with the books of the Company. The statement at October 31, 1954 is subject to possible year-end and audit adjustments; however, I believe that it is substantially correct.

I also refer you to our annual report for 1953 with auditors' more complete balance sheet and notes. I will be pleased to send any of this data on request. As stated I will consider it a privilege to answer questions by phone or in person.

In closing, let me state that I wholeheartedly endorse this proposal for my own and my family holdings. Likewise, officers and employes of the Company, with a considerable ownership, also favor the proposed transactions. As I have stated earlier, a majority of the stockholders have already evidenced their approval by depositing their

stock with the bank. May I again emphasize that in order to take advantage of this opportunity you should act promptly by signing and returning the Option and Proxy to me and sending your stock to the bank.

GEORGE B. HARRINGTON,
President.

COLUMN HEADING EXPLANATION

"Mine Characteristics"

The following is an explanation of the column headings as they appear in "PRODUCER DATA EXHIBITS, Mine Characteristics" in Set P-I, Reports A-D, DEFENDANTS' EXHIBIT NO. 49 :

1. Set P-I, Report A

Column:	Explanation:
COAL CO. -	(See Abbreviation Key)
MINE -	(See Abbreviation Key)
PRODUCING DISTRICT -	The Freight Rate District in which the given mine is located
TYPE -	Whether given mine is a strip, deep, or strip/deep mine
TONS -	The 1967 production at the given mine in thousands of tons
TRANSPORTATION USED -	The methods of transportation utilized in 1967 to transport coal from the given mine to consumers

2. Set P-I, Report B

Column:	Explanation:
COAL CO. -	(See Abbreviation Key)
MINE -	(See Abbreviation Key)

SEAM NO. - The seam mined at the particular mine in 1967. The digit which appears in the column is the same as the seam number mined, except that the code number "20" has been assigned to the Davis-DeKoven Seam and the code number "50" has been assigned to the Brazil Block Seam. In those cases where more than one seam was mined in 1967, a separate line for each seam is shown.

RATIO - The range within which the average overburden ratio at the given mine in 1967 is included

SEAM THCK - The thickness in inches of the seam mined in 1967

MAX OB (In feet) - The maximum overburden in feet at the mine in 1967

AVE OB (In feet) - The average overburden in feet at the mine in 1967

TOTAL TONS - The total 1967 production at the given mine in thousands of tons

PRODUCING DISTRICT - The Freight Rate District in which the given mine is located

3. Set P-I, Report C

Column: Explanation:

COAL CO. - (See Abbreviation Key)

MINE - (See Abbreviation Key)

PRODUCING DISTRICT - The Freight Rate District in which the given mine is located

DEPTH DEEP - The average depth of mining operations (in feet) for the year 1967

TONS - The total production at the given mine for 1967 in thousands of tons

4. Set P-I, Report D

This Report concerns mines employing both strip and deep mining methods in 1967.

See column explanations for Tables B-C.

COLUMN HEADING EXPLANATION

"Comparison of Leading Producers With Other Producers: Mine Size and Characteristics"

The following is an explanation of the column headings which appear in "PRODUCER DATA EXHIBITS, Comparison of Leading Producers With Other Producers: Mine Size and Characteristics" in Set P-I, Reports F_1, F_2 and G_2, DEFENDANTS' EXHIBIT NO. 50 :

In Report F_1, the mine characteristics of all mines of "leading coal producers" are set forth in alphabetical order by producer; in Report F2, the mine characteristics of all mines of "other coal producers" are set forth in the same manner.

1. Set P-I, Reports F_1 and F_2

Column:	Explanation:
COAL CO. -	(See Abbreviation Key)
MINE -	(See Abbreviation Key)
SEAM NO. -	The seam mined at the particular mine in 1967. The digit which appears in the column is the same as the seam number mined, except that the code number "20" has been assigned to the Davis-DeKoven Seam and the code number "50" has been assigned to the Brazil Block Seam. In those cases where more than one seam was mined in 1967, a separate line for each seam is shown.

TYPE - The average seam thickness (in inches) mined in 1967 at the particular mine

DEPTH DEEP - For deep mines, the average depth (in feet) of mining operations in 1967

MAX OB - For strip mines, the maximum overburden (in feet) for mining operations in 1967

AVE OB - For strip mines, the average overburden (in feet) for mining operations in 1967

RATIO - For strip mines, the overburden ratio for 1967 mining operations at the particular mine; the code numbers which appear hereunder are explained as follows:

Code "1" = an overburden ratio of less than 15:1
Code "2" = an overburden ratio from 15:1 through 19:1
Code "3" = an overburden ratio from 20:1 through 24:1
Code "4" = an overburden ratio from 25:1 through 29:1
Code "5" = an overburden ratio of 30:1 or more

W&S - An "X" in this column indicates that the particular mine has a washer and sizer facility; a BLANK in this column indicates the absence of such a facility at the particular mine

DRY - An "X" in this column indicates that the particular mine has a dryer facility; a BLANK in this column indicates the lack of such a facility at this particular mine

TK - An "X" in this column indicates that the particular mine has a truck loading facility; a BLANK indicates the lack of such a facility

RR - An "X" in this column indicates that the particular mine has a rail loading facility; a BLANK indicates the lack of such a facility

VOL - An "X" in this column indicates that the particular mine received a volume rail car rate for shipments in 1967; a BLANK indicates the lack of such a rate for 1967 shipments

UNIT - An "X" in this column indicates that the particular mine has unit train loading equipment; a BLANK in this column indicates the lack of such equipment

BGE - An "X" in this column indicates that the particular mine has barge loading facilities; a BLANK indicates the lack of such facilities

---

TOTAL TONS - The total 1967 production in thousands of tons at the particular mine

DRCT - This column indicates that percentage of the total coal sold in 1967 from the particular mine which was sold directly to consumers. Percentages have been coded according to the following table:

"11" - indicates	100%
"10" - indicates	90 - 99%
"9" - indicates	80 - 89%
"8" - indicates	70 - 79%
"7" - indicates	60 - 69%
"6" - indicates	50 - 59%
"5" - indicates	40 - 49%
"4" - indicates	30 - 39%
"3" - indicates	20 - 29%
"2" - indicates	10 - 19%
"1" - indicates	1 - 9%
"0" - indicates	0%

(percentages from Form 225 responses have been rounded to the nearest whole percent prior to assigning the above code numbers)

AGNT - This column indicates that percentage of the total coal sold in 1967 from the particular mine which was sold through an independent sales agency; percentages have been coded according to the above table

WHL - This column indicates that percentage of the total coal sold in 1967 from the particular mine which was sold through a wholesale distributor; percentages have been coded according to the above table

RET - This column indicates that percentage of the total coal sold in 1967 from the particular mine which was sold through a retail distributor; percentages have been coded according to the above table

OTH - This column indicates that percentage of the total coal sold in 1967 from the particular mine which was sold through some other method of sale; percentages have been coded according to the above table

---

PRODUCING DISTRICT - The Freight Rate District in which the particular mine is located

2. Set P-I, Report G_2

Report G_2 shows (1) the number of mines in Mining Districts 9, 10, and 11 for which a response to the Court-ordered Subpoena Questionnaire was received whose 1967 production was within the specified ranges and (2) the total 1967 tonnage in thousands of tons for all the mines within each specified range. This has been computed for the following categories:

(1) all mines,

(2) all strip mines,

(3) all deep mines,

(4) all strip/deep mines, and

(5) all "leading [company]" mines and all "other [company]" mines, as designated in Set P-I, Reports F_1 and F_2 respectively.

COLUMN HEADING EXPLANATION

Coal Characteristics By Producing Districts

The following is an explanation of the column headings which appear in "PRODUCER DATA EXHIBITS, Coal Characteristics By Producing Districts" in Sets P-2A, P-2B, and P-2C, DEFENDANTS' EXHIBIT NO. 51:

1. Set P-2A, Reports 1-12

Column:	Explanation:
TONS -	The total 1967 tonnage (in thousands of tons) of (raw)(washed) coal produced at all mines of the given type (strip, deep, or strip/deep) in the producing district specified in the respective reports
BTU -	The average British Thermal Units (in hundreds of units) of the (raw)(washed) coal produced at all the mines of the given type in the producing district specified in the respective reports; [all averages have been weighted by the number of tons produced at each BTU level in the total sample]
SULPHUR -	The average sulphur (to the nearest 1/100th of 1%) of the (raw)(washed) coal produced at all the mines of the given type in the producing district specified in the respective reports; [all averages have been weighted by the number of tons produced at each sulphur percentage in the total sample]
MOIST -	The average moisture (to the nearest one-tenth of 1%) of the (raw)(washed) coal produced at all the mines of the given type in the producing district specified in the respective reports; [all averages have been weighted by the number of tons produced at each moisture percentage in the total sample]

Column:	Explanation:
ASH -	The average ash (to the nearest one-tenth of 1%) of the (raw)(washed) coal produced at all the mines of the given type in the producing district specified in the respective reports; [all averages have been weighted by the number of tons produced at each ash percentage in the total sample]
FUSION -	The average fusion temperature (to the nearest whole degree) of the (raw)(washed) coal produced at all the mines of the given type in the producing district specified in the respective reports; [all averages have been weighted by the number of tons produced at each fusion temperature level in the total sample]

2. Set P-2B, Reports 1-12

Column:	Explanation:
TONS -	See explanation for Set P-2A, Reports 1-12
BTU -	-do-
SULPHUR -	-do-
MOIST -	-do-
ASH -	-do-
FUSION -	-do-

For each producing district, the above coal characteristics have been computed for raw coal and for washed coal produced according to the following sizes:

Code:	Size:
"Size 1" -	dust
"Size 2" -	carbon (0" x 1/4")
"Size 3" -	blends
"Size 4" -	screenings
"Size 5" -	all other sizes

For each producing district, the above characteristics have been computed for raw coal and for washed coal produced at the strip, deep, and strip/deep mines located in the specified producing district. The summary at the bottom of each Report indicates the total 1967 raw coal production and the total 1967 washed coal production (in thousands of tons) for the specified producing district.

3. Set P-2C, Reports 1-3

Column:	Explanation:
MINES -	The number of mines in the given producing district which produced the particular type of coal specified in the respective reports
BTU -	See explanation for Set P-2A, Reports 1 through 3
TONS -	-do-
BTU -	-do-
SULPHUR -	-do-
MOIST -	-do-
ASH -	-do-
FUSION -	-do-

Report 1 is a recapitulation of the washed coal characteristics for all sizes (combined) for each producing district in Mining Districts 9, 10, and 11.

Report 2 is a recapitulation of raw coal characteristics for all sizes (combined) for each producing district in Mining Districts 9, 10, and 11 which produces raw coal.

Report 3 is a recapitulation of the characteristics for the "dust size" coal, both washed and raw, produced in each producing district in Mining Districts 9, 10, and 11 which produces dust.

The summary at the bottom of each report indicates the total number of mines in Mining Districts 9, 10, and 11 which produced coal of the specified type and the aggregate 1967 production of that type at those mines.

COLUMN HEADING EXPLANATION

"Analysis: Overburden of Strip Mines and Depth of Deep Mines By Producing Districts"

The following is an explanation of the column headings which appear in "PRODUCER DATA EXHIBITS, Analysis: Overburden of Strip Mines and Depth of Deep Mines By Producing Districts" in Set P-I, Reports E_1 - E_7 and G_1, DEPENDANTS' EXHIBIT NO. 52 :

1. Set P-I, Reports E_1 - E_7

Column:	Explanation:
COAL CO. -	(See Abbreviation Key)
MINE -	(See Abbreviation Key)
SEAM NO. -	The seam mined at the particular mine in 1967. The digit which appears in the column is the same as the seam number mined, except that the code number "20" has been assigned to the Davis-DeKoven Seam and the code number "50" has been assigned to the Brazil Block Seam. In those cases where more than one seam was mined in 1967, a separate line for each seam is shown.
RATIO* -	The range within which the average overburden ratio at the given mine for 1967 stripping operations is included
SEAM THCK -	Thickness (in inches) of the seam mined in 1967 at the given mine
DEPTH DEEP** -	The average depth of deep mining operations (in feet) for the year 1967

MAX OB* - The maximum overburden (in feet) at the given mine for 1967 stripping operations

AVE OB* - The average overburden (in feet) at the given mine for 1967 stripping operations

TOTAL TONS - The total 1967 production at the given mine in thousands of tons

PRODUCING DISTRICT - The Freight Rate District in which the given mine is located

Each report contains mine characteristics for the strip mines (if any), the deep mines (if any), and for the strip/deep mines (if any) located in the producing district(s) as specified in the respective reports.

2. Set P-I, Report G_1

Report G_1 is a "frequency distribution" of average overburden ratios for all strip and strip/deep mines in Mining Districts 9, 10, and 11 for which a response to the Court-ordered Subpoena Questionnaire was received. Under each column which appears under the title "OVERBURDEN RATIO CATEGORY" is listed both the number of strip, or strip/deep, mines which had an average overburden within the given range in 1967 and the total 1967 production in thousands of tons for those mines. For both strip

---

* Applies to strip and strip/deep mines only.

** Applies to deep and strip/deep mines only.

mines and for strip/deep mines, there are summary tables setting forth the average "average overburden" (in feet) for all of the mines listed under each overburden ratio category. These average "average overburden" figures have been weighted by the number of tons which were produced at each average overburden in the total sample.

CONSUMER Q-NAIRE

Form Number 100

GENERAL INSTRUCTIONS

The questionnaires seek two types of information: (1) details concerning purchases of coal of 20,000 tons or more in 1966 and 1967 or equivalent 12-month periods, for each of your facilities located in Illinois, Indiana, Kentucky, Tennessee, Missouri, Iowa, Wisconsin or Minnesota which consumed coal produced in Illinois, Indiana or West Kentucky (mining districts 9, 10 and 11); and (2) information concerning the characteristics of each such facility as they relate to the consumption of coal. The first questionnaire requests separate information for each mine supplying each facility. The second asks for information about the facility itself. Examples of completed questionnaires are provided as a guide.

The information sought should be for the company, organization, or agency named in the subpoena, as well as for all subsidiaries, affiliates and divisions. The forms enclosed may be reproduced or copied if a sufficient number have not been supplied.

Questionnaires should be completed ONLY for those facilities located in Illinois, Indiana, Kentucky, Tennessee, Missouri, Iowa, Wisconsin or Minnesota which consumed coal produced in Illinois, Indiana or West Kentucky (mining districts 9, 10 and 11). No questionnaire need be completed for facilities NOT located in the states mentioned.

SPECIFIC INSTRUCTIONS

I. COAL PURCHASES QUESTIONNAIRE

The information sought should be provided for 1966 and 1967, or equivalent 12-month periods ending as close to December 31, 1966 and December 31, 1967 as possible, for each facility which consumed coal produced in Illinois, Indiana or West Kentucky. For example, if your purchasing "season" or existing contracts terminate on a date other than December 31, use the "seasons" or contract termination dates nearest to December 31 of 1966 and 1967, and indicate the period used at the top of each questionnaire.

A separate form should be used for each mine supplying a particular facility. No form need be filled out for mines whose total shipments of coal to the facility during the year in question were less than 20,000 tons.

Where purchases are made from firms other than actual coal producers, please provide as much information as is known.

The following instructions are numbered to correspond to specifically numbered questions.

#5. If, during the applicable year, more than one purchasing method was used to buy coal from the mine involved, estimate the percentage of the total tons purchased from that mine by each means of purchase.

#6. The information sought in all parts of question #6 should be broken down according to coal size.

#6(a). Please identify each variety of blend, screenings or "other" size supplied.

#6(b). Tons purchased should be broken down according to size and may be approximate.

#6(c). "F.O.B. Mine" should be interpreted as referring to the price per ton at either the mine or its originating shipping point. Contract or purchase order price should be used, gross of discounts, premiums or penalties.

#6(d). This information should correspond either to contract guarantee requirements or, if there is no contract guarantee, to expectation. Results of your own sampling analysis are not necessary, but, if used, should be indicated by "(S)".

#6(e), (f), (g), and (h). For each listed characteristic (i.e., sulphur content, moisture content, ash content, and fusion temperature) indicate, by minimum, maximum or range, as appropriate, the requirements you specified that the coal meet. If no requirement was specified, insert "None."

#7. Please indicate all methods used to transport the coal from the mine involved to your facility. If more than one method of transportation is used, please provide the information requested for each method.

II. COAL CONSUMING FACILITY QUESTIONNAIRE

This questionnaire should be completed for each facility in Illinois, Indiana, Kentucky, Tennessee, Missouri, Iowa, Wisconsin or Minnesota which consumed 20,000 tons or more of coal in 1967 that was produced in Illinois, Indiana or West Kentucky.

Questions 7, and 8 are designed to obtain information with respect to the characteristics of the coal that was required in 1967 for the type of equipment in which the coal was used at the facility.

PRODUCER Q-NAIRE

Form Number 200

GENERAL INSTRUCTIONS

The questionnaires seek two types of information: (1) details concerning mining conditions, characteristics of coal produced and mine facilities in 1967 for each of your mines in mining districts 9, 10 and 11 (Illinois, Indiana and West Kentucky); and (2) estimates of coal reserves, as of recent date, in mining districts 9, 10 and 11. Examples of completed questionnaires are provided as a guide.

The information sought should be supplied for the company named in the subpoena, as well as for all subsidiaries, affiliates and divisions. The forms enclosed may be reproduced or copied if a sufficient number have not been supplied.

SPECIFIC INSTRUCTIONS

I. MINE INFORMATION

The first questionnaire requests separate information for each of your mines. A separate form should be used for each mine. The information sought should be provided for 1967, or, if your records are not kept on a calendar year basis, for the 12-month period ending as close to December 31, 1967 as possible.

Question #10: the information sought in all parts of #10 should be broken down according to coal size. Tons produced [#10(b)] for each coal size may be approximate. Please identify each variety of blend, screenings and "other" size produced. Note that your answer concerning the minimum and maximum price per ton of coal F.O.B. mine [#10(c)] is to be limited to information concerning shipments of 20,000 tons or more to facilities located in Illinois, Indiana, Kentucky, Tennessee, Missouri, Iowa, Wisconsin or Minnesota.

II. RESERVES

The most recent annual compilation of reserves by your company should be used and the date indicated. Please include data with respect to reserves owned, leased or optioned by any subsidiary, affiliate, division or nominee.

COAL RESERVE ESTIMATE

The estimated tonnage should include all coal owned in fee, under lease or optioned by your company and any subsidiary, affiliate, division or nominee as of the most recent compilation. Only reserves located in mining districts 9, 10 and 11 (Illinois, Indiana or West Kentucky) need be shown.

3. COAL RESERVES DEDICATED TO EXISTING MINES:

NAME OF MINE	Estimated Strip Tonnage (Tons)	Estimated Deep Tonnage (Tons)	Percentage of Recovery Used for Estimated Tonnage	
			Strip	Deep
Black Beauty No. 1	30,000,000		80	
Black Beauty No. 2	20,000,000		80	
Sally Ann		50,000,000		55
Total Tons:	50,000,000	50,000,000		

4. OTHER COAL RESERVES (owned, leased, or optioned by your company or any subsidiary, affiliate, division or nominee, as of most recent compilation, located in mining districts 9, 10, and 11 (Illinois, Indiana, and West Kentucky)):

COUNTY	STATE	Estimated Strip Tonnage (Tons)	Estimated Deep Tonnage (Tons)	Percentage of Recovery Used for Estimated Tonnage	
				Strip	Deep
Coal County	Ill.		47,000,000		55
River County	Ill.	35,000,000		90	
Mine County	Ky.		250,000,000		55
Smith County	Ind.	30,000,000		90	
Total Tons:		65,000,000	297,000,000		

SAMPLE

5. Explain briefly methods used for determining percentage of recovery for both strip and deep tonnage:

Strip: Prior mining experience in seams involved

Deep: Prior mining experience using conventional equipment

6. Information supplied is as of December 31, 1968

Filed 3/11/69

UNITED STATES DISTRICT COURT

NORTHERN DISTRICT OF ILLINOIS

EASTERN DIVISION

UNITED STATES OF AMERICA, Plaintiff, v. GENERAL DYNAMICS CORPORATION; THE UNITED ELECTRIC COAL COMPANIES; and FREEMAN COAL MINING CORPORATION, Defendants.	)	CIVIL ACTION NO. 67 C 1632

AGREED ORDER

Pursuant to the stipulation of the parties by their respective attorneys, and for the purpose of avoiding the necessity of deposing officers and managerial personnel of the respondents designated below,

IT IS HEREBY ORDERED that the Clerk of the United States District Court for the Northern District of Illinois, Eastern Division, shall issue subpoenas duces tecum in the form attached for service in any judicial district of the United States upon the respondents listed in Exhibit A to this Order. Such service may be made by the Clerk by registered mail, return receipt requested.

Such subpoenas shall command such respondents to appear and produce for examination, inspection, and copying by attorneys for the parties at the Office of the Clerk of the Court of said Northern District of Illinois, Eastern Division, 219 South Dearborn Street, Chicago, Illinois 60604, all documents in respondent's possession showing, in whole or in part, the information requested by the attached questionnaire or, in lieu of such appearance and production, to mail a full and complete response to the questionnaire signed by a responsible officer of the company on which the subpoena is served who has personal knowledge of the company's compliance with the subpoena and under whose supervision compliance is being effectuated.

IT IS FURTHER ORDERED that the documents and the contents thereof, and the responses to the attached questionnaire, shall not be disclosed to any officer, director, employee or agent of any defendant or of any coal producer, seller, or customer except upon a showing of good cause and further order of this court.

UNITED STATES DISTRICT COURT

NORTHERN DISTRICT OF ILLINOIS

EASTERN DIVISION

UNITED STATES OF AMERICA, Plaintiff, v. GENERAL DYNAMICS CORPORATION; THE UNITED ELECTRIC COAL COMPANIES; and FREEMAN COAL MINING CORPORATION, Defendants.	)	CIVIL ACTION NO. 67 C 1632

AGREED ORDER

Pursuant to the stipulation of the parties by their respective attorneys, and for the purpose of avoiding the necessity of deposing officers and managerial personnel of the respondents designated below,

IT IS HEREBY ORDERED that the Clerk of the United States District Court for the Northern District of Illinois, Eastern Division, shall issue subpoenas duces tecum in the form attached for service in any judicial district of the United States upon the respondents listed in Exhibit A to this Order. Such service may be made by the Clerk by registered mail, return receipt requested.

Such subpoenas shall command such respondents to appear and produce for examination, inspection, and copying by attorneys for the parties at the Office of the Clerk of the Court of said Northern District of Illinois, Eastern Division, 219 South Dearborn Street, Chicago, Illinois 60604, all documents in respondent's possession showing, in whole or in part, the information requested by the attached questionnaire or, in lieu of such appearance and production, to mail a full and complete response to the questionnaire signed by a responsible officer of the company on which the subpoena is served who has personal knowledge of the company's compliance with the subpoena and under whose supervision compliance is being effectuated.

IT IS FURTHER ORDERED that the documents and the contents thereof, and the responses to the attached questionnaire, shall not be disclosed to any officer, director, employee or agent of any defendant or of any coal producer, seller, or customer except upon a showing of good cause and further order of this court.

"Type 1" is the code number given "LARGE UTILITIES"; "Type 2" is the code for "SMALL UTILITIES." The distinction between the two categories is based upon a comparison of the type of power system and the total tons of coal purchased by that system in 1967. Thus, the classification "SMALL UTILITIES (Type 2)" represents all cooperative and municipal power systems whose facilities in the aggregate purchased less than 500,000 tons of coal in 1967. The classification "LARGE UTILITIES (Type 1)" consists of all corporate power systems, public or private, and all cooperative or municipal systems whose 1967 total coal consumption at all facilities combined was 500,000 or more.

Union Electric	Meramac	St. Louis	St. Louis	Missouri
Central Elec. Power Coop.	Chamois	Chamois	Callaway	Missouri

2. Coal Consumption by Utility Facilities Located In Belleville Sales Area

	Tons Consumed (000)		% of Total Consumption
Belleville Production Consumed by Utilities in Sales Area	7446		80%
Consumption of Coal Produced in Other Freight Rate Districts in Mining Districts 9, 10 & 11			
Southern [1]	918	10%	
West Kentucky	436	5%	
Mineral-Atkinson	429	5%	
Springfield [2]	62	1%	
	1845		21%
TOTAL CONSUMPTION BY UTILITIES IN SALES AREA	9291		100%*

* The apparent discrepancy between actual sum of the subtotals above and the total above is due to rounding. Each figure has been rounded to the nearest one percent.

3. Belleville Production Sold to Utilities

	Tons Produced (000)	% of Total Production
Sold to Utilities in Sales Area	7446	45%
Sold to Commonwealth Edison	6526	40%
Sold to Greater Chicago Air Quality Control Region	1307	8%
Sold to Other Utilities	1097	7%
TOTAL PRODUCTION SOLD TO UTILITIES BY MINES IN BELLEVILLE FRT. DIST.	16376	100%

[1] Excludes 970,000 tons of dust from mines in the Southern Freight Rate District to the Cahokia, Venice and Meramac facilities of Union Electric, the Alma facility of Dairyland Power and the Wood River facility of Illinois Power. See the corresponding Forms 150, Subpoena Questionnaire.

[2] This is a shipment from the Little Dog Mine in the Springfield Freight Rate District to the Wood River facility of Illinois Power made possible because both mine and plant are local to the Illinois Terminal Railroad. See Beck Dep. Tr., pp. 11-12, 34. No other Springfield District mine is so located.

Source: Form 150, Subpoena Questionnaire

ANALYSIS OF SALES TO NON-UTILITY FACILITIES OF COAL PRODUCED IN THE BELLEVILLE FREIGHT RATE DISTRICT

1. Non-Utility Facilities in Belleville Sales Area

Company	City	County	State
American Oil	Wood River	Madison	Illinois
Alton Box Board	Alton	Madison	Illinois
Shell Oil	Roxanna	Madison	Illinois

Drew Foods	St. Louis	St. Louis	Missouri
Mallinckrodt Chemical	St. Louis	St. Louis	Missouri
Monsanto	St. Louis	St. Louis	Missouri
National Lead	St. Louis	St. Louis	Missouri
Swift & Co.	St. Louis	St. Louis	Missouri

2. Coal Consumption by Non-Utility Facilities Located in Belleville Sales Area

	Tons Consumed (000)	% of Total Consumption
Belleville Production Consumed by Non-Utilities in Sales Area	1254	98%
Consumption of Coal Produced in Other Freight Rate Districts in Mining Districts 9, 10 & 11 Springfield [1]	25	2%
TOTAL CONSUMPTION BY NON-UTILITIES IN SALES AREA	1280	100%

[1] This is a shipment from the Little Dog Mine in the Springfield Freight Rate District to the Wood River plant of American Oil made possible because both mine and plant are local to the Illinois Terminal Railroad. See Beck Dep. Tr., pp. 11-12, 34. No other Springfield District mine is so located.

3. Belleville Production Sold to Non-Utilities

	Tons Produced (000)	% of Total Production
Sold to Non-Utilities in Sales Area	1254	65%
Sold to Greater Chicago Air Quality Control Region	469	24%
Sold to Other Non-Utilities	220	11%
TOTAL PRODUCTION SOLD TO NON-UTILITIES FROM MINES IN BELLEVILLE FRT. DIST.	1943	100%

Source: Form 150, Subpoena Questionnaire

RECAPITULATION OF SALES OF COAL PRODUCED IN THE BELLEVILLE FREIGHT RATE DISTRICT

1. Coal Consumption by All Facilities in Belleville Sales Area

	Tons Consumed (000)		% of Total Consumption	
Belleville Production Consumed by All Facilities in Sales Area		8700		82%
Consumption of Coal Produced in Other Freight Rate Districts in Mining Districts 9, 10 & 11				
Southern Illinois[1]	918		9%	
W. Kentucky	436		4%	
Mineral-Atkinson	429		4%	
Springfield[2]	88	1871	1%	18%
TOTAL CONSUMPTION OF COAL BY FACILITIES IN SALES AREA		10571		100%

2. Belleville Production Sold to All Facilities

	Tons Produced (000)	% of Total Production
Sold to Facilities in Sales Area	8700	47%
Sold to Commonwealth Edison	6526	36%
Sold to Chicago Air Quality Control Region	1776	10%
Sold to Other Facilities	1317	7%
TOTAL	18319	100%

[1] Excludes 970,000 tons of dust from mines in the Southern Freight Rate District to the Cahokia, Venice and Meramac facilities of Union Electric, the Alma facility of Dairyland Power and the Wood River facility of Illinois Power. See the corresponding Forms 150, Subpoena Questionnaire.

[2] This tonnage represents shipments of 62,000 tons and 26,000 tons from the Little Dog Mine in the Springfield Freight Rate District to the Wood River Station of Illinois Power and the Wood River plant of American Oil respectively. These transactions were made possible because that mine and both facilities are local to the Illinois Terminal Railroad. See Beck Dep. Tr., pp. 11-12, 34. No other Springfield District mine is so located.

ANALYSIS OF SALES TO ELECTRIC UTILITIES OF COAL PRODUCED IN SOUTHERN (ILLINOIS) FREIGHT RATE DISTRICT

1. Utility Facilities Located in Southern Sales Area

DEFENDANT'S EXHIBIT NO. 56

ANALYSIS OF SALES TO ELECTRIC UTILITIES OF COAL PRODUCED IN FULTON-PEORIA FREIGHT RATE DISTRICT

1. Utility Facilities Located in Fulton-Peoria Sales Area

Company	Facility	City	County	State
Illinois	Havana	Havana	Mason	Illinois
	Hennepin	Hennepin	Putnam	Illinois
CILCO	Edwards	Bartonville	Peoria	Illinois
	Liberty	Peoria	Peoria	Illinois
	Wallace	E. Peoria	Tazewell	Illinois
CIPS	Meredosia	Meredosia	Morgan	Illinois

2. Coal Consumption by Utility Facilities Located in Fulton-Peoria Sales Area

		Tons Consumed (000)		% of Total Consumption
Fulton-Peoria Production Consumed by Utilities in Sales Area		1984		80%
Consumption of Coal Produced in Other Prieght Rate Districts in Mining Districts 9, 10 & 11 1/				
Belleville	493		20%	
West Kentucky	1	494	*%	20%
TOTAL CONSUMPTION BY UTILITIES IN SALES AREA		2478		100%

3. Fulton-Peoria Production Sold to Utilities

	Tons Produced (000)	% of Total Production
Sold to Utilities in Sales Area	1984	34%
Sold to Commonwealth Edison	3794	65%
Sold to Other Utilities	28	1%
TOTAL PRODUCTION SOLD TO UTILITIES BY MINES IN FULTON-PEORIA FRT. DIST.	5806	100%

Source: Government Questionnaire

1/ Excludes shipment of 92,000 tons of dust from Crown Mine in Springfield District to Meredosia facility of CIPS. See CIPS Form 150 (Meredosia), Subpoena Questionnaire.

Table G - 2F

ANALYSIS OF SALES TO NON-UTILITY FACILITIES OF COAL PRODUCED IN THE FULTON-PEORIA FREIGHT RATE DISTRICT

1. Destinations in Fulton-Peoria Sales Area

City	County	State

2. Coal Consumption by Non-Utility Facilities Located in Fulton-Peoria Sales Area

	Tons Consumed (000)	% of Total Consumption
Fulton-Peoria Production Consumed by Non-Utilities in Sales Area	2371	81%
Consumption of Coal Produced in Other Freight Rate Districts in Mining Districts 9, 10 & 11		
Southern Illinois 251 1/		9%
Belleville 7		*%
Springfield 1		*%
West Kentucky 31		1%
Mineral-Atkinson 284	574	10%
TOTAL CONSUMPTION BY NON-UTILITIES IN SALES AREA	2945	100% 2/

Source: Government Questionnaire

1/ Includes 73,000 tons (3%) of low-sulphur coal (1.2%) from Freeman's Orient #3 Mine in the Southern Freight District to the Dixon plant of Medusa Portland Cement for equipment requiring coal having a maximum sulphur content of 1.2%. See Medusa Portland Cement Form 150, Subpoena Questionnaire and letter of August 15, 1968 from Thompson, Hine and Flory to Plaintiff.

2/ The apparent discrepancy between actual sum of the subtotals above and the total above is due to rounding. Each figure has been rounded to the nearest one percent.

ANALYSIS OF POTENTIAL AND ACTUAL
USE OF FUEL(S) OTHER THAN COAL
BY COAL CONSUMING FACILITIES

DX 59

Type of Consumer	TABLE A GAS CAPABILITY[1] # Facilities	TABLE A GAS CAPABILITY[1] # Coal Tons (add 000)	TABLE B OIL CAPABILITY[1] # Facilities	TABLE B OIL CAPABILITY[1] # Coal Tons (add 000)
LARGE UTILITIES:	38 [of 84] (45%)	23,281 [of 74,202] (31%)	12 [of 84] (14%)	12,148 [of 74,202] (16%)
SMALL UTILITIES:	5 [of 28] (18%)	385 [of 2,329] (17%)	6 [of 28] (21%)	886 [of 2,329] (38%)
MANUFACTURING FIRMS:	66 [of 160] (41%)	5,397 [of 12,657] (43%)	34 [of 160] (21%)	3,090 [of 12,657] (24%)
INSTITUTIONS:	5 [of 17] (29%)	264 [of 1,095] (24%)	9 [of 17] (53%)	833 [of 1,095] (76%)
TOTAL:	114 [of 289] (39%)	29,302 [of 90,283 total tons] (33%)	61 [of 289] (21%)	16,957 [of 90,283 total tons] (19%)

1/ Tables A and Table B are compilations of responses to Question #5, Form 175 [Coal Consuming Facility Questionnaire]. "Capability" to burn a given fuel other than coal exists if a particular facility is equipped to consume such fuel for any purpose, regardless of whether or not actual use occurred in 1967. The columns titled "# Tons" show the total tons of coal burned in 1967 at facilities which have the given capability. These tonnage figures are derived from responses to Form 150 of the Court-ordered Subpoena Questionnaire.

The distinction between the "Large Utilities" and "Small Utilities" is based upon a multi-dimensional comparison of the type of power system and the aggregate coal tonnage consumed within that system. Thus, the "Small" category consists of all co-operative and municipal power systems whose facilities consumed less than 500,000 tons of coal in the aggregate in 1967. The "Large" category consists of all corporate power companies, public and private, and all municipal or co-operative systems whose 1967 total coal consumption at all facilities combined was 500,000 tons or more.

TABLE C

GAS AND/OR OIL CAPABILITIES[2/]

	# Facilities	# Coal Tons (add 000)
LARGE UTILITIES	46 [of 84] (55%)	33,182 [of 74,202] (45%)
SMALL UTILITIES	9 [of 28] (32%)	1,157 [of 2,329] (50%)
MANUFACTURING FIRMS	73 [of 160] (46%)	5,873 [of 12,657] (46%)
INSTITUTIONS	11 [of 17] (65%)	877 [of 1,095] (80%)
TOTAL:	139 [289] (48%)	41,089 [90,283] (46%)

2/ Table C shows the number of facilities with gas, oil, or gas and oil capabilities. Thus, facilities with both gas and oil capabilities have been counted only once.

TABLE D

FREQUENCY DISTRIBUTION OF ACTUAL GAS USAGE - 1967[3/]

[Number of Facilities]

	1-2 Months	3-5 Months	6-12 Months	Special Purposes	No Actual Use
LARGE UTILITIES [38 facilities]	X (0)	3 (8%)	30 (79%)	1 (3%)	4 (11%)
SMALL UTILITIES [5 facilities]	X (0)	1 (20%)	3 (60%)	X (0)	1 (20%)
MANUFACTURING [66 facilities]	X (0)	7 (11%)	42 (64%)	6 (9%)	11 (17%)
INSTITUTIONAL [5 facilities]	X (0)	2 (40%)	3 (60%)	X (0)	X (0)

3/ Table D is a compilation of responses to Question 6, Form 175 [Coal Consuming Facility Questionnaire]. The above groupings reflect actual natural gas usage in terms of months for the year 1967 by coal consuming facilities for which a response to the Subpoena Questionnaire was received, and a gas capability there indicated. "Special purposes" is the designation assigned for actual use solely for the purposes of start-up, peaking, or emergency. The percentages in parentheses are based upon the total number of facilities which have the capability to burn gas.

TABLE D-1

FREQUENCY DISTRIBUTION OF ACTUAL GAS USAGE - 1967[4/]

[Number of Tons of Coal]
(add 000)

	1-2 Months	3-5 Months	6-12 Months	Special Purposes	No Actual Use
LARGE UTILITIES [23,281 tons]	X (0)	3,056 (13%)	19,025 (82%)	550 (2%)	650 (3%)
SMALL UTILITIES [385 tons]	X (0)	131 (34%)	201 (52%)	X (0)	53 (14%)
MANUFACTURING FIRMS [12,657 tons]	X (0)	354 (7%)	3,718 (69%)	347 (6%)	978 (18%)
INSTITUTIONS [264 tons]	X (0)	170 (64%)	94 (36%)	X (0)	X (0)

4/ Table D-1 is a compilation of responses to Question 6, Form 175 [Coal Consuming Facility Questionnaire. The tonnage figures represent the aggregate tons of coal purchased in 1967 for facilities actually using natural gas in the above frequencies, stated in terms of months for the year 1967. The percentages in parentheses are based upon the total number of tons of coal consumed in 1967 at facilities having the capability to burn gas. [All tonnage figures are derived from responses to Form 150 of the Questionnaire.]

TABLE E

FREQUENCY DISTRIBUTION OF ACTUAL OIL USAGE - 1967[5/]

[Number of Facilities]

	1-2 Months	3-5 Months	6-12 Months	Special Purposes	No Actual Use
LARGE UTILITIES [12 facilities]	X (0)	X (0)	4 (33%)	4 (33%)	4 (33%)
SMALL UTILITIES [6 facilities]	1 (17%)	X (0)	X (0)	1 (17%)	4 (67%)
MANUFACTURING FIRMS [34 facilities]	1 (3%)	5 (15%)	10 (29%)	8 (24%)	10 (29%)
INSTITUTIONS [9 facilities]	X (0)	1 (11%)	1 (11%)	2 (22%)	5 (56%)

5/ Table E is a compilation of responses to Question 6, Form 175 [Coal Consuming Facility Questionnaire]. The above groupings reflect actual oil usage in terms of months for the year 1967 by coal consuming facilities for which a response to the Subpoena Questionnaire was received and an oil capability there indicated. "Special purposes" is the designation assigned for actual use solely for the purposes of start-up, peaking, or emergency. The percentages in parentheses are based upon the total number of facilities which have an oil capability.

TABLE E-1

FREQUENCY DISTRIBUTION OF ACTUAL OIL USAGE - 1967[6/]

[Number of Tons of Coal]
(add 000)

	1-2 Months	3-5 Months	6-12 Months	Special Purposes	No Actual Use
LARGE UTILITIES [12,148 tons]	X (0)	X (0)	2,507 (21%)	7,474 (62%)	2,167 (18%)
SMALL UTILITIES [886 tons]	114 (13%)	X (0)	X (0)	140 (16%)	632 (71%)
MANUFACTURING FIRMS [3,090 tons]	101 (3%)	244 (8%)	1,464 (47%)	552 (18%)	729 (24%)
INSTITUTIONS [833 tons]	X (0)	50 (6%)	80 (10%)	358 (43%)	345 (41%)

6/ Table E-1 is a compilation of responses to Question 6, Form 175 [Coal Consuming Facility Questionnaire]. The tonnage figures represent the aggregate tons of coal purchased in 1967 for facilities actually using oil in the above frequencies, stated in terms of months, for the year 1967. The percentages in parentheses are based upon the total number of tons of coal consumed in 1967 at facilities having the capability to burn oil. [All tonnage figures are derived from responses to Form 150 of the Questionnaire.]

TABLE F

Facilities [and the Corresponding Tons of Coal Purchased at Those Facilities in 1967] Equipped to Burn Gas for Each and Every Purpose for Which Coal Was Burned in 1967 7/

	# of Facilities	# of Coal Tons
LARGE UTILITIES	37 (of 38) (97%)	22,852 (of 23,281) (98%)
SMALL UTILITIES	5 (of 5) (100%)	385 (of 385) (100%)
MANUFACTURING FIRMS	52 (of 66) (79%)	3,921 (of 5,397) (73%)
INSTITUTIONS	4 (of 5) (80%)	184 (of 264) (70%)

7/ Tons are rounded to Nearest 1,000. In the column headed "# of Facilities", the percentages in parentheses represent the ratio of the number of facilities equipped to burn gas for all of the purposes for which coal was burned in 1967 to the total number of all facilities with a gas capability. In the column headed "# of Coal Tons", the percentages in parentheses represent the ratio of the aggregate number of tons purchased by facilities which are equipped to burn gas for every purpose for which coal was burned in 1967 to the total number of tons of coal purchased by all facilities with a gas capability.

TABLE G

Facilities [and the Corresponding Tons of Coal Purchased at Those Facilities in 1967] Equipped to Burn Oil for Each and Every Purpose for Which Coal was Burned in 1967[8/]

	# of Facilities	# of Coal Tons
LARGE UTILITIES	10 [of 12] (92%)	11,946 [of 12,148] (98%)
SMALL UTILITIES	6 [of 6] (100%)	886 [of 886] (100%)
MANUFACTURING FIRMS	27 [of 34] (79%)	1,917 [of 3,090] (62%)
INSTITUTIONS	7 [of 9] (78%)	584 [of 833] (70%)

8/ Tons are rounded to Nearest 1,000. In the column headed "# of Facilities", the percentages in parentheses represent the ratio of the number of facilities equipped to burn oil for all of the purposes for which coal was burned in 1967 to the total number of all facilities with an oil capability. In the column headed "# of Coal Tons", the percentages in parentheses represent the ratio of the aggregate number of tons purchased by facilities which are equipped to burn oil for every purpose for which coal was burned in 1967 to the total number of tons of coal purchased by all facilities with an oil capability.

(C) CHANGES IN RESERVE TONNAGE 1958 - 1969

MEMO

CHANGES IN STRIP RESERVE TONNAGE DURING 1969

MINE NO. 9

Mined Out	(805,608)
Estimated Adjustment	(91,200)
Yield Loss	(55,538)
New Lands	7,727
Net Change	(944,619)

MINE NO. 11

Mined Out	(1,146,041)
Estimate Change	(460,046)
Yield Gain, Present Pit	111,734
New Lands	2,059,337
Net Change	564,984

CLINCH PIT

Mined Out	(687,909)
Yield Gain	29,585
Estimated Adjustment	17,741
Net Change	(640,583)

MINE NO. 17 (NORTH)

Mined Out	(957,832)
Estimated Adjustment	-
Yield Gain	29,023
Net Change	(928,809)

MINE NO. 17 (SOUTH)

Mined Out	(1,304,530)
Estimated Adjustment	508,356
Yield Gain	142,638
New Leases	-
Net Change	(653,536)

MINE NO. 27

Mined Out	(685,932)
Estimated Adjustment	(242,976)
Yield Loss	(46,092)
Net Change	(975,000)

(D) POSSIBLE ACQUISITIONS

THE UNITED ELECTRIC COAL COMPANIES
Possible Acquisitions
Cuba - Mine #9
Fulton County, Illinois

Name	Acres	Possible Coal Acres	Possible Tons	Remarks
ringe Tracts	308	50	300,000	Acquisition Doubtful. Coal in Islands
Total	308	50	300,000	

his mine has operated over 40 years, and is bounded by the City of uba, outcrop of the No. 5 and No. 6 coals on the west and south, orth and east by old works of other companies.

/1/70

THE UNITED ELECTRIC COAL COMPANIES
Possible Acquisitions
Fidelity - Mine #11
Perry County, Illinois

Name	Acres	Possible Coal Acres	Possible Tons	Remarks
Northwest Field				
Walker	120	60	Less than 500,000	Negotiating
Fringe Tracts	-	-	250,000	Negotiating
Total	120	60	Less than 750,000	
Kathleen or Southwest Area				
Harsha	40	20	160,000	Cannot Acquire to Date
Eisenhauer	20	10	80,000	Negotiating
Sutter	80	60	500,000	Negotiating
Fringe Tracts	-	-	300,000	Negotiating
Total	140	90	1,040,000	

Mine was started in 1929. Land acquisition in 1926, and only hard to buy reserves remain. Mine is bounded on the north by mined out ground, on the east by Du Quoin and old works, south by old works and cropline of No. 6 coal, on the west by cropline and cutout several miles wide, west of which the coal has been removed. As far as is known there is no minable coal in the No. 6 or any other vein, deep or strip, that can be added.

3/1/70

THE UNITED ELECTRIC COAL COMPANIES
Possible Acquisitions
Buckheart - Mine #17
Fulton County, Illinois

Name	Acres	Possible Coal Acres	Possible Tons	Remarks
Bull	80	75	500,000	In Estate - Cannot Buy at Present
McLouth	160	80	500,000	Extremely doubtful
Total	240	155	1,000,000	

The mine has operated since 1937. Bounded on the north by old works, unminable coal and cutout of coal, on the east by the cropline of No. 5 coal, south by old works and end of coal field, and on the west by large cutout and cropline of No. 5 coal.

3/1/70

THE UNITED ELECTRIC COAL COMPANIES
Possible Acquisitions
Banner - Mine #27
Peoria & Fulton Counties, Illinois

Name	Acres	Possible Coal Acres	Possible Tons	Remarks
Fuller	30	30	100,000	Not drilled.

Mine No. 27 lies in the river bottom and is surrounded by natural boundaries. North by a range of hills containing little coal recoverable by stripping or underground mining, east by a narrow river bottom and levee, south by the Illinois River and west by Rice Lake. 462 acres north and northeast of the field has been drilled and dropped.

3/1/70

THE UNITED ELECTRIC COAL COMPANIES
Possible Acquisitions
North Canton

Fringe Areas - When the field is opened, we may option and drill several farms adjoining the cropline, but less than 500,000 tons of additional reserves, if any, are expected. Field is limited to No. 6 coal, practically all of which has been delineated, plus a small amount of No. 5 in valleys.

Sutter	80	60	500,000	Negotiating
Fringe Tracts	-	-	300,000	Negotiating
Total	140	90	1,040,000	

Mine was started in 1929. Land acquisition in 1926, and only hard to buy reserves remain. Mine is bounded on the north by mined out ground, on the east by Du Quoin and old works, south by old works and cropline of No. 6 coal, on the west by cropline and cutout several miles wide, west of which the coal has been removed. As far as is known there is no minable coal in the No. 6 or any other vein, deep or strip, that can be added.

Re: United States v. General Dynamics Corporation et al., Civil Action No. 67 C 1632 (N.D. Ill.)
60-0-37-920

Dear Mr. Cusack:

This is in reply to your letter of April 9 addressed to Mr. C. F. John requesting information in regard to the above referenced civil action.

The information requested in paragraphs 1 and 2 of your letter is detailed in Tables I and II attached. All coal purchased for the following generating stations for the years 1964 through 1967 was delivered to storage docks by lake vessels during the navigation season for Lake Michigan, which normally extends from April 1 to December 1 each year:

Oak Creek Power Plant
Port Washington Power Plant
Commerce Street Power Plant
East Wells Street Power Plant

This coal was consumed approximately from mid-April of the year in which it was delivered to mid-April of the following year. Coal purchased for use at our Lakeside Power Plant for the same years was consumed during the calendar year in which it was purchased. The footnotes of Tables I and II explain the variance in the period coal was purchased and consumed.

In response to your paragraph 3, during the referenced period facilities for generating electricity by utilizing oil and gas were available at the Commerce Street Power Plant. Details in regard to gas and oil consumption are given in Table III attached. Boiler #25 of this plant is the only unit so equipped and was equipped to burn gas or oil exclusively since November, 1964. This unit has a capability of 22,000 kw

when supplying 230,000 lbs. per hour of steam for our heating utility. The footnotes to Table III explain the seasonal usage of gas and oil and the portion of each used for steam production at this plant.

In response to paragraph 4, no facilities were available for generating electricity by nuclear energy through the years 1964 through 1967.

Facilities for generating electricity from other sources as requested in paragraph 5 are limited to hydroelectric and diesel plants of Wisconsin Michigan Power Company, a wholly owned subsidiary of Wisconsin Electric Power Company. The information which you requested regarding these facilities is given in Table IV attached.

Data in response to paragraph 6 of your letter are not available.

You will note from the several documents attached that the majority of our coal is derived from mines in Illinois and western Kentucky. We believe that the acquisition by General Dynamics Corporation of the United Electric Coal Companies made it possible for the latter companies to have available financial resources for the development of mining properties and to increase the availability of coal sources from these regions.

You may wish to correct your records to indicate that Mr. C. F. John retired as Vice President in Charge of Power on December 31, 1965.

Very truly yours,

Robert H. Gorske

Robert H. Gorske General Counsel

Attach.

DEFENDANT'S EXHIBIT 67

COST FOR GAS FUEL VS. COAL FUEL FOR PEKIN BOILER HOUSE

During 1967, natural gas was used in the plant for various process uses while coal was used exclusively in the boiler house.

To determine the effect of burning all gas in the boiler house instead of coal, data from monthly boiler efficiency calculations was taken. The total heat required in coal fuel during grind and no grind periods and the average boiler efficiency was tabulated. This heat was converted into equivalent gas heat on the basis of gas boilers operating at 83% efficiency.

The increased amount of gas used on the boilers is all used at the lowest contract rate. There is no separate demand charge for gas, any demand rate consideration is included in the contract rates.

The following data summarizes the above calculations for each month during 1967.

Cost of gas fuel for boilers to supply an equivalent amount of heat as from coal for the year 1967 (based on gas, incremental rate, grind, and no grind)	$2,036,800 per year
Actual cost of coal burned in boiler house during year 1967 (grind and no grind)	$1,191,909 per year
Additional cost of fuel to operate boiler house on gas instead of coal (based on incremental gas rate, grind and no grind)	$ 844,891 per year

DEF 2/12/68

COMPANY LETTER

Moffet Technical Center
Argo, Illinois
February 13, 1968

TO: R. Meadowcroft

FROM: D. F. Franzen

SUBJECT: *Gas Firing In Boiler Houses at Argo and Pekin*

The Purchasing Department and the Pekin Plant have assured me, through their contacts with the gas companies, that sufficient gas is available to convert the steam generating facilities at Argo and Pekin from burning coal to gas.

The additional cost of fuel to operate the boiler houses on gas instead of coal, based on incremental gas cost and for the grind and no grind period of 1967 is

Argo, $984,000 per year

Pekin, $845,000 per year

DFF:pld

COMPANY LETTER

Moffet Technical Center
Argo, Illinois
February 23, 1968

TO: R. Meadowcroft

FROM: D. F. Franzen

FILE: Air Pollution

SUBJECT: *All Gas Firing for Boilers, Argo and Pekin*

In my letter of February 23 on this subject, I should have included the additional expense of about $50,000 per boiler for combustion controls at both the Argo and Pekin Plants.

	Total Cost of Combustion Control
Pekin—Boilers "A", "B", and "C" at $50,000	$150,000
Argo—Boilers 1, 2, and 3 at $50,000	150,000

DFF:pld

COMPANY LETTER

Moffet Technical Center
Argo, Illinois
February 23, 1968

TO: R. Meadowcroft

FROM: D. F. Franzen

FILE: Air Pollution

SUBJECT: *Gas Vs. Coal for Entire Pekin Boiler House*

My letter to you, dated February 13, 1968, indicated the additional cost that would have been entailed for the year 1967, if the Pekin Plant had burned all gas instead of coal was $845,000 per year.

Estimated operating savings which would be achieved if all coal burning were eliminated are:

Labor-coal and ash handling	$ 85,000 per year
Maintenance on coal unloading and conveying, coal bunkers, scales, feeders, pulverizers, stokers and ash handling equipment.	60,000
Power used by pulverizers, stokers and other coal and ash handling equipment	38,000
Fly ash and cinder disposal	20,000
Sluice water for ash system	5,000
Total direct savings	$208,000 per year
It may be necessary to install additional dust collecting facilities on each of Boilers "A" and "B" and "C" if we were to continue to burn coal. This total cost is roughly estimated to cost about $650,000. Potential operating savings by not having to install this equipment based on 5% maintenance and 5% depreciation is	65,000 per year

It should be noted that the above dust collecting facilities will not eliminate SO_2 problems in the flue gas and at

some time in the future, additional expenditures may be involved.

Additional intangible items resulting from all gas burning instead of coal are:

1. The coal track could be used for other process requirements such as hydrol or syrup systems.
2. Extended boiler life, less abrasion problems.
3. May be allowed extended periods between boiler inspections.
4. Reduction in mechanical stores items.

Re: U. S. v. General Dynamics, et al.
Civil Action No. 67 C 1632 (N.D. Ill.)

Dear Mr. Cusack:

This has reference to your letter of August 7, 1968, in the captioned matter in which you asked confirmation of certain facts provided to you by Mr. Strausbaugh during your August 2 visit to Medusa's office.

Mr. Strausbaugh advises that there are four kilns at Dixon. Three of these kilns are 150 feet in length, are considered "short" kilns, and use coal having a maximum sulphur content of 1.2%.

The remaining kiln is 400 feet in length, is considered a "long" kiln, and uses coal having a maximum sulphur content of 3.2%.

I trust that the foregoing will clarify the matters about which you made inquiry in your August 7 letter.

Sincerely,

John McClatchey

Attention: Mr. Ronald L. Futterman

Re: United States v. General Dynamics Corporation et al., Civil Action No. 67 C 1632 (N. D. Illinois)

Gentlemen:

The following information is submitted as requested by Mr. Futterman by phone. This is in lieu of questions submitted in a letter dated July 25, 1968 by Mr. John T. Cusak, Attorney, Midwest Office, Antitrust Division.

1. We do not purchase, nor have we purchased, any coal from mines located in the state of Illinois. This is true for two reasons. First, the freight from Illinois mines to our plants in Paulding, Ohio and Fredonia, Kansas makes the cost prohibitive; and secondly, the quality of the coal is poor since it does not come from deep mines. Mr. Futterman has asked about our policy relative to sulphur content and the methods for compensating for excessive sulphur. Sulphur is not a major factor in our purchases of coal because it combines with our product. Coal is purchased exclusively on BTU content and is purchased by the seam from which it is mined.

   Since mid-1963 all coal was purchased from North American Coal Corporation from their mine at Powhatan Point, Ohio. Purchases for the years in question were:

   1964 - 98,350.65 tons
   1965 - 99,228.80 tons
   1966 - 102,290.49 tons
   1967 - 90,760.30 tons

Cleared
61-1-37-0
DEPARTMENT OF JUSTICE
SEP 23 1968

3. Cement manufactured in our Paulding, Ohio plant is sold in Ohio, Indiana and Michigan. Our Fredonia, Kansas plant ships into the states of Kansas, Missouri, Arkansas and Oklahoma. Neither plant ships into the state of Illinois. Freight rates are such that we would not be competitive in this market.

Our Fredonia, Kansas plant is located in what is well known as the gas-belt, its primary fuel being gas. It does, however, on occasion, use coal during cold weather when the gas supply is curtailed for home consumer use. Our gas supply was last curtailed in February, 1963 during which period we used 171 tons of coal from inventory. Our last purchase of coal for kiln fuel at this plant was December, 1960 and the coal at that time was purchased from Pittsburgh Midway Coal Company from their mine in West Mineral, Kansas.

Yours truly,

R. M. Schafer
Treasurer

CLEON L. BURT
VICE PRESIDENT-LAW

September 29, 1969

Mr. Hugo Sims
Department of Justice
Room 2634 United States Courthouse
Chicago, Illinois 60604

Re: United States v. General Dynamics Corporation, et al., Civil Action No. 67 C 1632 (N.D. Ill.)

Dear Mr. Sims:

In our conversation of several days ago, you asked me certain questions about the burning of coal in our cement plant at Selma, Missouri. The questions, as I understood them, and the answers thereto are as follows:

1. Is it intended that our No. 2 Kiln, which is equipped to burn coal as an alternate fuel, will be switched to coal at times in the future as and when the gas supply is interrupted?

   - The answer to this question is that we do intend and expect to switch the No. 2 Kiln to the burning of coal when the gas supply is interrupted.

2. You inquired as to the usual period of time during which the natural gas supply to our plant is interrupted or curtailed.

   As to this, I cannot give you any better answer than I did verbally. As you know, the amount of interruption depends on numerous factors, the principal among which are the physical deliverability conditions of the pipeline supplier and the demands of domestic and commercial users. During the 1968-69 heating season, I am informed that gas was curtailed at the plant for between three and four months; whereas in the preceding year, the curtailment was much less severe. Accordingly, the curtailment can vary from almost nothing to three or four months. As a very rough approximation, I would say that 90 days out of the year might be a reasonable period on the average for cement plant gas curtailment.

Very truly yours,

Cleon L. Burt

Air Mail

John T. Cusack, Esq.
Department of Justice
Room 2634 United States Courthouse
Chicago, Illinois 60604

Dear Mr. Cusack:

In response to your letter to American Maize-Products Company dated April 15, 1968, the following information was gathered by American Maize-Products Company in response to your inquiries:

Under paragraph 1, total tons or dollar value of annual coal purchases for the years 1964 through 1967:

Year	Quantity Tons	Value
1964	117,365	$ 731,601
1965	112,639	697,196
1966	117,449	743,945
1967	106,483	693,437

The tonnage by mine for the years 1964 through 1967:

Year	Orient #3	Orient #4	Orient #5	Total
1964	111,858	5,784	---	117,642
1965	40,923	4,210	70,241	115,374
1966	6,418	368	108,486	115,272
1967	6,187	---	101,310	107,497

There is as you will notice, a difference between the figures showing tonnage by mine as opposed to Maize's coal purchases. The tonnage by mine figures are loaded weights at the mine. The annual coal purchases are the unloaded weights and the difference is lost in shipping.

60-0-37-925
DEPARTMENT OF JUSTICE
MAY 29 1968

The coal is used in coal burning boilers for the generation of steam. The steam in turn is used primarily in Maize's production department for evaporation and drying of Maize's products and for space heating.

As a secondary use the steam passes through turbines for the generation of electricity. The coal is burned in pulverized coal burning, high pressure boilers, which are also equipped to burn oil and gas as secondary fuels. The coal burning boilers are also equipped with continuous pilots, fueled by either gas or oil. Oil is burned in these boilers only when the coal supply is interrupted and gas is not available. Gas is the preferred secondary fuel. When interruptible gas is available, it is used in preference to all other fuels.

Annual purchases of fuel oil and gas are listed below:

Year	Quantity-Barrels	As Tons Of Coal	Value
1964	12,273	3,515	$ 38,968
1965	10,757	3,080	33,161
1966	11,569	3,313	34,417
1967	28,695	8,217	82,508

Year	Quantity-Cubic Feed	As Tons Of Coal	Value
1964	1,683,575,500	76,526	$ 631,749
1965	1,714,460,000	77,930	656,467
1966	1,879,110,000	85,414	771,827
1967	1,897,243,300	82,148	767,889

In addition to the coal burning equipment Maize does have package boilers which are equipped to burn oil or gas. Oil is the primary fuel of these boilers except when Interruptible gas is available. The package boilers are preferred over coal burning boilers because of the lower initial capital investment and the reduced time between ordering and start-up. They are also preferred because of the rising hue and cry to air pollution.

The gas as shown for the four years was not all consumed in the boilers. Maize does have gas fired feed dryers, gas fired starch dryers, and gas fired oil heating equipment for the production of dextrines. Gas is the only fuel which can be used in the drying and dextrinization processes.

The decision and reasons for burning a particular fuel is governed primarily by cost. The unit cost of Maize various fuels are as follows:

Coal	.02465	$/Therm
Oil	.04607	$/Therm
Gas (Firm)	.0483	$/Therm
Gas (Interr)	.0400	$/Therm

The plant can be equipped to convert from coal to gas or oil in the coal burning boilers with a few changes in piping and controls. This would probably require a capital investment of approximately $10,000. The removal, however, of the coal handling and burning equipment and the ash handling and disposing equipment would be much more expensive. No estimate is available on the cost of these removals.

There is no question that if Maize ever discontinued the burning of coal for any appreciable period, the possibility of ever returning to coal burning equipment would be very slim. It would not be practical to try to "moth-ball" the coal handling, milling and burning equipment.

If we can be of any further assistance, please do not hesitate to call on us.

Very truly yours,

Charles Egan

Re: United States v. General Dynamics Corporation et al., Civil Action No. 67 C 1632 (N.D. Ill.)

Dear Sir:

In response to your letter dated April 15, 1968, this will advise as follows:

1. Exhibit I attached hereto sets forth the net tons and dollar value delivered of metallurgical coal and steam coal purchased from firms supplying Inland Steel Company's East Chicago, Indiana, facility in each of the years 1964 through 1967. Mine source of coal where known is furnished.

Metallurgical coal is consumed in coke batteries for the production of coke for the blast furnaces. Steam coal is used to fire boilers for the production of steam.

2. Inland's East Chicago facility consumes certain other energy fuels for the purpose or purposes for which coal is consumed. In addition to steam coal, certain of the electric generating stations burn purchased petroleum coke, natural gas and fuel oil. Fuel oil is also consumed in the blast furnaces. Exhibit II attached hereto lists the quantities and

dollar value of the aforementioned petroleum coke, natural gas and fuel oil purchased in each of the years 1964 through 1967. The exhibit does not include blast furnace gas or coke oven gas consumed in certain of Inland's generating stations inasmuch as these are by-products produced within the plant and not purchased.

3. The following sets forth the reasons why Inland's East Chicago facility has not exclusively utilized one energy fuel in those instances where other energy fuels in addition to coal are consumed:

(a) In the blast furnaces, fuel oil is injected because (i) Inland's coke production is not sufficient to cover its total coke requirements and (ii) additional charging capacity is available in the skips for ore. For these purposes and in the quantities required fuel oil is cheaper, in general, than purchased coke.

(b) The use of different energy fuels in each of Inland's generating stations is dependent on the design characteristics of the station. In one generating station fuel oil is used to cover shortages in available powdered coal, the economics of fuel oil vs. powdered coal being approximately equal. A second generating station burns blast furnace gas, coke oven gas and fuel oil, the facility not being designed to consume coal. At a third generating station coal is the primary fuel, but petroleum coke and natural gas, when the latter is available, are burned as substitutes for coal for economic reasons.

Coal is not consumed in the open hearth furnaces, the basic oxygen furnaces or the reheating furnaces.

The information furnished on the enclosed exhibits has been prepared from a variety of internal sources. We cannot vouch for its accuracy in every respect. For example, with respect to steam coal purchases, we have been obliged in certain instances to estimate freight costs to arrive at delivered values.

We know of no documentation needed or helpful to substantiate or more fully explain the information herewith submitted.

I trust you will treat confidentially the information herewith voluntarily furnished to you.

Very truly yours,

George A. Ranney

Mr. John Cusack, Attorney
U. S. Department of Justice
Anti-Trust Division
219 South Dearborn Street
Chicago 4, Illinois

Dear Mr. Cusack:

Following our recent telephone conversation, I talked to various persons in this office about the question that you raised as to whether or not the acquisition of United Electric Coal Company by General Dynamics would in any way affect our sources of coal.

I do not believe we have ever purchased coal from United Electric Coal Company, and I believe that you pointed out in our conversation that United Electric Coal Company supplied coal primarily to the utilities industry.

We have purchased coal from a number of companies in the Midwest, and we do not believe that the acquisition of United Electric Coal Company by General Dynamics would have any effect on our future purchases of coal.

I hope this answers your recent inquiry.

Yours very truly,

W. J. Shaw

Chicago, Illinois 60604

Re: United States v. General Dynamics Corporation, et al., Civil Action No. 67 C 1632 (N.D. Illinois)

Dear Mr. Zimmerman:

This is in response to your letter of August 5, 1968, requesting information of our company in connection with the above case.

The questions and answers are as follows:

1.A. Total tons and dollar value of annual coal purchases from all firms supplying your Festus, Missouri plant in each of the years 1964 through 1967.

No coal was purchased for our Festus (Selma) Missouri plant during the years 1964 through 1967.

B. Please state the purpose for which coal is required and generally describe the equipment in which coal is consumed.

Coal is not required in the operation of the plant. Kiln No. 1 of the plant, presently in operation, is not equipped to burn coal. Kiln No. 2, which is under construction, will be equipped to burn coal when necessary or desirable. If and when coal is consumed, it would be consumed for firing a rotary clinker producing kiln (Kiln No. 2) in the production of portland cement, said kiln to be 17-1/2' x 16' x 560' in size.

60-0-[illegible]
DEPARTMENT OF JUSTICE
SEP 13 1968
DIVISION OF RECORDS

2.A. Please state whether your Festus, Missouri plant consumes any other energy fuel for the purpose for which coal is required.

See answer to question 1.B. Both natural gas and No. 6 oil are used at the plant for firing Kiln No. 1. Kiln No. 2 will use natural gas and coal.

B. If so, state for each such fuel the annual dollar and quantity (barrels of oil, cubic feet of gas, etc.) or equivalent coal ton purchases for the years 1964 through 1967.

	No. 6 Fuel Oil		Natural Gas	
	Gallons	$	MCF	$
1964	-0-	-0-	-0-	-0-
1965	2,711,125	191,942	1,392,786	375,634
1966	303,776	21,524	2,773,905	748,351
1967	1,267,863	132,650	2,773,124	780,439

C. Also, please generally describe the equipment in which each fuel is consumed.

Kiln No. 1, being a rotary kiln 17-1/2' x 16' x 560' in size.

3.A. If consumption of other energy fuels is in addition to coal consumption, please state the reason(s) why the plant involved does not exclusively utilize one energy fuel.

Consumption of other energy fuels is not in addition to coal consumption since there has been no coal consumption to date. However, the plant is equipped to utilize more than one fuel to assure continuous operation of the plant, in case one or more of the possible fuels is not available or becomes non-competitive in cost.

Mr. Edwin M. Zimmerman
Department of Justice
Chicago, Illinois

B. If consumption of other energy fuels substitutes for consumption of coal, please indicate the criteria used to determine when it is appropriate to switch from one energy fuel to another.

Other energy fuels will not be substituted for coal; on the contrary, coal may be substituted for other fuels on Kiln No. 2. Cost and availability would be the primary criteria for determining when it is appropriate to switch from one energy fuel to another. However, various other factors would no doubt be involved which cannot be determined in advance. Such factors might include cleanliness, fuel handling problems, etc.

4. Please furnish to us copies of any charts, memoranda, surveys or other documents which would substantiate or more fully explain the information requested above or which bear on the advantages, disadvantages, or uniqueness of any of the energy fuel sources. Please include any studies or estimates as to the feasibility of immediately converting from coal to any other energy fuel source.

None available.

5.A. Please state whether or not a ceiling is placed on the sulfur content or the coal purchased, and if so, state the maximum tolerable sulfur content and the present sulfur content of coal consumed.

Should coal be purchased in the future, we anticipate that we would specify a maximum tolerable sulfur content of about 3.5% on a dry basis.

B. Also state whether or not these tolerances may be adjusted to compensate for low-sulfur or high-sulfur raw materials used in the manufacture of cement.

Not presently determinable.

Very truly yours,

RIVER CEMENT COMPANY

Re: United States v. General Dynamics Corporation et al., Civil Action No. 67 C 1632 (N.D. Ill.)

In reply to your letter of January 22 regarding the above matter, I shall further clarify my letter of January 20 regarding gas purchases at the St. Louis and Joppa plants.

Gas consumed at these plants in the years indicated was primarily used in conjunction with coal for technical reasons. In general, the rates for this gas would be considered firm rather than interruptible. I am not familiar with the exact meaning of the term "seasonal" in your letter. With respect to the St. Louis plant, it would be significant to know that gas is now used as the predominant fuel as it is now less expensive than coal at this point.

Very truly yours,

WJB:ba

Antitrust Division
United States Department of Justice
Room 2634 United States Courthouse
Chicago, Illinois 60604

Dear Mr. Long:

In accordance with our telephone conversation, attached is a compilation showing the amount of coal in dollars and in tons purchased by Marquette Cement Manufacturing Company during the years 1964 and 1965 for its cement plants at DesMoines, Iowa; Cape Girardeau, Missouri and Oglesby, Illinois.

Due to the location of United Electric Coal Company and its ability to furnish coal on barges, Marquette, since at least 1938, has obtained its coal for the Oglesby plant under long-term contracts negotiated with United Electric Coal Company.

Similarly, because of its location, United Electric Coal Company has not been able and has not endeavored to supply coal to the Cape Girardeau or Des Moines plants.

In view of the factual circumstances, Marquette cannot see that there would be any effect upon it if the United Electric Coal Company is eliminated as an independent supplier of coal.

I am informed that Marquette has not had any arrangements or understandings with General Dynamics Corporation or any subsidiary thereof to purchase coal from General Dynamics Corporation or any subsidiary thereof on condition or

DEPARTMENT OF JUSTICE
DEC 27 1966
DIVISION OF RECORDS

consideration that General Dynamics or any subsidiary thereof purchase cement from Marquette.

I trust the foregoing gives you the information you desire.

Very truly yours,

William R. Engelhardt

October 21, 1966

Mr. Bertram M. Long
Assistant Chief, Midwest Office
Antitrust Division
United States Department of Justice
Room 2634, United States Courthouse
Chicago, Illinois 60604

Dear Mr. Long:

Referring to your letter of October 14, 1966 addressed to Mr. Herbert A. Blair of our Company, File No. 60-0-37, we are enclosing a list of suppliers of coal for the years 1964 and 1965, the quantity each of these suppliers furnished, and the payments made to each supplier.

No coal received by the Central Illinois Light Company in the years 1964 and 1965 was mined outside of the State of Illinois.

United Electric Coal Company and Freeman Coal Mining Corporation have both bid on supplying coal to our Company; however, we have not considered these two firms to be competitors inasmuch as Freeman supplied our Springfield Station and United Electric supplied our Peoria plants.

To answer question No. 5,

> "What effect, if any, may there be on your firm and on other public utilities if The United Electric Coal Companies is eliminated as an independent supplier of coal"

would be highly speculative in connection with the effect on other public utilities; however, we feel the elimination of United Electric Coal Company, as an independent supplier, would have little or no effect upon the Central Illinois Light Company inasmuch as we have a long term contract which runs to a period when, in our opinion, the reserves in the mine that now supplies us, will be exhausted.

September 22, 1969

Mr. Hugo S. Sims, III
Attorney, Midwest Office
Antitrust Division
Department of Justice
Room 2634 United States Courthouse
Chicago, Illinois 60604

Re: United States vs. General Dynamics Corporation, et al

Dear Mr. Sims:

In response to your recent telephone inquiry regarding the above matter, I will attempt to clarify the basis for useage of coal and gas at our three midwestern cement manufacturing plants. This data will supplement that previously requested and supplied in my letters of January 20, January 24, May 2, and May 21, 1969.

Kansas City Plant. Gas has been used for all purposes beginning sometime in 1964 to date. The rate is considered to be interruptible but the supply is sufficient to serve us without interruption throughout our entire production year. Production is normally discontinued for a couple of winter months for economic reasons. Gas is used because it is cheaper than coal.

St. Louis Plant. Over the years, coal and gas have been alternated as fuels for kiln operations depending upon the price of each fuel. The gas used for the years 1964 through 1967, as reported in my letter of January 20, 1969, was for heating purposes only. This gas was purchased on a non-interruptible basis. Coal was used exclusively for kiln operations because at that time it was more economical under a long-term contract. For more than a year, however, we have reverted to alternating coal and gas as fuels as gas prices have become more competitive. For the twelve months ended August 31, 1969, coal consumption amounted to $449,371 for 72,646 tons and gas consumption amounted to $554,828 for 2,173,972 MCF. This gas was supplied on an interruptible basis at a lower cost than coal. Coal was utilized only during the cold weather months when the supply of gas became uncertain.

60-1-37-(1)
DEPT. OF JUSTICE
SEP 23 1969
Grueach

Joppa Plant. To date, coal has been the cheapest fuel available at this plant since its completion in 1963. For this reason it has been used exclusively for kiln operations. Gas could and would be utilized for this purpose if it should become cheaper than coal. The gas that has been used at this plant has been for other purposes, such as heating and drying, for which it is preferable for technological reasons. This gas is supplied on a non-interruptible basis.

In summary, kiln operations at our three plants presently utilize three different types of fuel supply -- coal at Joppa, gas at Kansas City and a combination of coal and gas at St. Louis. At two of these locations, St. Louis and Kansas City, the fuels utilized have changed in the past five years due to changes in the competitive prices of coal and gas. Cost is the determining factor.

Very truly yours,

WJB:bmt

Dear Mr. Moore:

KENNECOTT COPPER CORPORATION

In accordance with provisions of Part B of Attachment A to subpoena duces tecum issued by the Federal Trade Commission under date of December 31, 1968 on behalf of Kennecott Copper Corporation, we have prepared and submit for your information the exhibits listed below:

Exhibit I - Companies which responded to subpoena duces tecum
II - Selected information requested in subpoena duces tecum

We have prepared Exhibit II from data furnished to us by the participating companies listed in Exhibit I. Our work was limited to receiving and compiling the data into composite form, hence we did not compare the individual company data submitted to us with the records of such companies and no audit procedures were carried out by us. Accordingly, while we are satisfied that the data have been properly summarized, we can assume no responsibility for the underlying amounts and figures.

Every possible precaution has been taken to prevent the direct or inferential identification of the data of a particular company in the composite amounts and figures.

* * * * *

Should you have any questions about our procedures in compiling the data, please let us know.

Yours very truly,

Price Waterhouse & Co.

EXHIBIT II

SELECTED INFORMATION REQUESTED IN SUBPOENA DUCES TECUM ISSUED BY FEDERAL TRADE COMMISSION UNDER DATE OF DECEMBER 31, 1968 ON BEHALF OF KENNECOTT COPPER CORPORATION

(Unaudited)

1. Of the fifteen companies (listed in Exhibit I) served with subpoena duces tecum, the five companies shown below reported holding recoverable coal reserves in 1967:

Atlantic Richfield Company
Continental Oil Company
Gulf Oil Corporation
Humble Oil & Refining Company
Sinclair Oil Corporation

2. The above five companies reported holdings of recoverable coal reserves and acres of coal lands as follows:

(a) Total recoverable coal reserves of 7.8 million tons* in 1960 and 10,188.7 million tons in 1967.

(b) Total acres of coal lands of 4,524 acres in 1960 and 2,491,079 acres in 1967.

(c) Total recoverable coal reserves in 1960 and 1967, respectively, of:

(i) Zero million tons and zero million tons in Arizona.
(ii) Zero million tons and 234.0 million tons in Colorado.
(iii) Zero million tons and zero million tons in Idaho.
(iv) Zero million tons and 106.0 million tons in Montana.
(v) Zero million tons and zero million tons in Nevada.
(vi) Zero million tons and 222.0 million tons in New Mexico.
(vii) Zero million tons and 296.5 million tons in Utah.
(viii) Zero million tons and 1,276.0 million tons in Wyoming.
(ix) Zero million tons and 2,537.2 million tons in states west of the Mississippi River.

*Throughout tons refers to short tons.

FEDERAL TRADE COMMISSION

...eal acres of coal lands in 1960 and 1967, respectively, of:

(i) Zero acres and zero acres in Arizona.
(ii) Zero acres and 41,400 acres in Colorado.
(iii) Zero acres and zero acres in Idaho.
(iv) Zero acres and 7,900 acres in Montana.
(v) Zero acres and zero acres in Nevada.
(vi) Zero acres and 46,614 acres in New Mexico.
(vii) Zero acres and 73,064 acres in Utah.
(viii) Zero acres and 367,000 acres in Wyoming.
(ix) Zero acres and 635,782 acres in states west of the Mississippi River.

3. The five companies (listed in Item 1) holding recoverable coal reserves in the United States in 1967 are grouped as follows:

(a) One company reported total recoverable coal reserves of over 5,000 million tons.

(b) Two companies reported total recoverable coal reserves each of 1,000 million to 2,750 million tons.

(c) Two companies reported total recoverable coal reserves each of under 1,000 million tons.

4. The five companies (listed in Item 1) first acquired recoverable coal reserves or coal lands as follows:

(a) One company in 1955
(b) One company in 1962
(c) One company in 1963
(d) One company in 1965
(e) One company in 1966

FEDERAL TRADE COMMISSION
Exhibit No. 7765 ... Exhibit No. 7746

5. Of the five companies (listed in Item 1), none reported holding recoverable coal reserves in Utah in 1960. Two of the five companies reported holding such reserves in 1967.

6. Of the five companies (listed in Item 1), none reported holding recoverable coal reserves in Arizona, Colorado, Idaho, Montana, Nevada, New Mexico and Wyoming in 1960. Four of the five companies reported holding, in aggregate, such reserves in Colorado, Montana, New Mexico and Wyoming in 1967; no coal reserves were reported by such companies for Arizona, Idaho and Nevada in 1967.

7. Of the five companies (listed in Item 1), none reported holding recoverable coal reserves in states west of the Mississippi River in 1960. Four of the five companies reported holding such ... reserves ... 1967

. of the fifteen companies (listed in Exhibit I), eleven reported expenditures for research, study, or development in the conversion of coal to synthetic fuels, with the following breakdown by years:

(a) Three companies in 1963
(b) Four companies in 1964
(c) Five companies in 1965
(d) Seven companies in 1966
(e) Seven companies in 1967
(f) Four companies in period 1963-1967*

*Four companies reported estimated aggregate expenditures of $291,300 for the period 1963-1967. No specific breakdown was furnished for the individual years in that period.

9. The eleven companies referred to in Item 8 reported expenditures of $14,138,748 for research, study, or development in the conversion of coal to synthetic fuels during the years 1963-1967, both inclusive, of which $6,508,473 was reported as company funds and $7,630,275 as grants from others.

FEDERAL TRADE COMMISSION
Docket No. 7116 Exhibit No. 1944

DX 81 Standard Oil Company (New Jersey)

1968 Annual Report

* * *

March 6, 1969

We are pleased to report that earnings of Standard Oil Company (New Jersey) in 1968 increased $122 million to a record $1,277 million, or $5.94 per share, up 10.8 per cent over the comparable earnings of $5.36 per share in 1967. Accounting changes, which are described in the notes to the accompanying financial statements, had the effect of reducing the earnings figures for both years.

Dividend payments to shareholders were increased for the eighth year in a row—from $3.75 per share in 1967 to $3.85 in 1968. This was the 86th consecutive year of dividend distributions.

Total revenue rose to $15,873 million, an increase of 7.7 per cent over 1967.

Production of crude oil and natural gas liquids reached a new high rate of 5,225,000 barrels a day, up 8.2 per cent over 1967, with marked increases in production in the United States, Venezuela, and Libya. Improved manufacturing facilities in all areas and expanded capacity in Europe made possible record refinery crude oil runs of 4,621,000 barrels a day. Worldwide sales of petroleum products increased 5.0 per cent to 4,881,000 barrels a day.

The production and sale of natural gas is making an increasingly significant contribution to Jersey's total revenue. In 1968 sales of natural gas increased sharply to 5,296 million cubic feet a day. Sales in the large U.S. market accounted for 80.8 per cent of the total. However, fast-growing sales in Europe more than doubled those of 1967. Jersey's 30 per cent interest in production from the Groningen field in the Netherlands, for sale in that country and for export, is expected to double again by 1970. Initial deliveries of natural gas from the fields in the North Sea, imminent shipment of liquefied natural gas from Libya to Spain and Italy, and the beginning of gas deliveries from our joint venture in Australia also attest to the growing importance of gas to the company's future results.

Jersey's performance in 1968 is attributable in large measure to the results of an aggressive investment program. Capital expenditures made in recent years have provided the capacity for significant increases in operating volumes. Con-

tinued efforts toward cost reduction and efficiency also have contributed to improved profitability. Jersey's return on average shareholders' equity increased to 13.3 per cent last year, up from 12.6 per cent the year before and the highest in more than a decade. Further improvement is expected in 1969.

In 1968 company investments in new property, plant, and equipment amounted to $1,944 million. Slightly more than half of the 1968 investments were in the United States. A further $195 million was spent and charged to income in 1968 as part of the company's worldwide exploration program which is designed to support the objectives of increasing reserves and of diversifying the company's sources of crude oil and natural gas.

Affiliates are finding and taking advantage of major opportunities for increasing earnings in the future. In addition to the growth of natural gas sales, the investment programs associated with crude oil production from the Alaskan Arctic and offshore southeastern Australia are of particular importance. The grand scale of these exciting opportunities requires a continued high level of capital expenditures—a level which the company's strong financial position makes possible to maintain.

The demand for energy throughout the world continues to increase steadily. Improvements in the standard of living in industrialized nations and greater realization of aspirations among developing countries ensure dynamic growth in the demand for energy.

In the United States, total energy requirements are estimated to increase at an average of 4 per cent a year, which means in ten years they will be almost half again as large as they are today. The demand for oil and gas, which supply three-fourths of these requirements, is anticipated to grow proportionately. Energy consumption is increasing even faster elsewhere in the free world, and oil and natural gas are expected to supply nearly all the near-term growth in these energy requirements.

Jersey affiliates will maintain their traditional leading position as suppliers of petroleum products to free world countries. Their demonstrated success in meeting the needs of growing markets in the continents of the globe promises to continue the company's growth and profit improvement in 1969 and the years ahead. Our confidence in the future is strengthened by the enthusiastic commitment of the thousands of company employees around the world. We appreciate their loyal efforts as well as the continued support of our shareholders.

United States The vigorous growth of the United States economy accelerated the demand for energy during 1968. Humble Oil & Refining Company continued to contribute significantly to Jersey's results and to be a leader in the domestic petroleum industry.

The year's highlight was the discovery of oil and gas on the North Slope of Alaska by a joint venture composed of Humble and Atlantic Richfield Company. One successful well was drilled at Prudhoe Bay and another at Sag River, seven miles away. In this North Slope area, Humble has a 50 per cent interest in approximately 800,000 acres. Evaluation drilling and seismic work are continuing. The discovery appears to be very significant, but further drilling is necessary to provide an estimate of the reserves.

Widespread speculation over the relative size of the potential North Slope reserves has tended to obscure the unusual problems and costs associated with exploring for oil in Alaska, producing it, and transporting it to markets. Substantial investments will be required to overcome difficulties attributable to extreme cold, the remoteness of the North Slope, the absence of transportation facilities, the tundra over the permafrost which becomes swamp-like in summer, and the ice in the Arctic Ocean.

To start North Slope crude oil on its way to markets by 1972, Humble and other interested companies intend to build a 48-inch pipeline and terminal at an initial cost of about $900 million. The line will run some 800 miles from Prudhoe Bay—across the tundra and permafrost, two mountain ranges, and several river valleys—to a year-round deep-water port in southern Alaska. In addition, Humble and other companies, with the cooperation of the U.S. Coast Guard and Department of the Navy and the Canadian Department of Transport, plan to test the feasibility and economics of carrying oil through the Arctic Ocean, between Canada's Arctic islands, and into the North Atlantic. This icy route, known as the Northwest Passage, will be tested later in 1969 by a chartered tanker which will have an exceptionally strong hull, an icebreaker bow, and special equipment to protect propeller and rudder.

Humble and other companies invested substantial sums in 1968 to acquire leases from the federal government off the coasts of California and Texas. Offshore California, in the Santa Barbara Channel, three discovery wells have been announced, in one of which Humble has an interest. Humble also had encouraging results at other locations nearby. Further work will be required to define the magnitude of reserves. Offshore Texas, in the Gulf of Mexico, exploration results so far have been disappointing. Some indications of oil and gas were encountered at one well in which Humble has an interest, but the commercial potential of this area remains doubtful.

Onshore Humble had a good exploration year. In addition to the Alaskan find, significant discoveries included two oil and gas wells in the Delaware Basin of West Texas, one in southern Louisiana, and one in deep sands of the old Pollard field of Alabama. Future drilling should

provide sufficient information for substantial reserve additions from these discoveries during the next few years.

During 1968 Humble improved profitability by increasing production and applying additional cost control measures in its oil and gas fields. A computerized system to measure and control production was introduced in the Friendswood field near Houston to test techniques for automation of producing properties. Continued emphasis also was placed on the identification and disposition of producing properties which were marginal to Humble's operations.

Humble's new 72,000-barrel-a-day refinery at Benicia, California, was approaching completion at the end of 1968. This refinery, designed by Esso Research and Engineering Company, is planned for intensive refining of heavy crude oils to give high yields of motor gasoline. Computer technology will be used extensively in controlling this highly complex operation.

Sales of petroleum products set new highs. New operating efficiencies, coupled with relatively firm prices for these greater volumes, helped to offset rising costs for goods and services.

Taking advantage of opportunities offered by new road construction and housing developments, Humble inaugurated about 500 new service stations in locations having potential for large sales volumes and closed a number of less profitable retail outlets.

Humble also continued to enhance the appearance of its service stations. Many existing outlets were modernized and landscaped, and new stations were designed to harmonize with and complement their neighborhoods.

In innovating to offer a broader line of services to the motoring public, Humble increased from 30 to 47 the number of its car care centers. These centers offer more complete vehicle servicing than regular service stations and a Humble guarantee of work performed. At some of its car care centers, where high volume justified the additional investment, Humble also installed diagnostic facilities which provide computerized analyses of vehicle safety and performance.

Humble continued its active participation in the rapidly growing market for jet aircraft fuel, deriving about 10 per cent of its 1968 market sales volume from this product. Humble and

other affiliates combined increased by about 16 per cent their 1968 worldwide commercial jet fuel sales. Investments were made in refining, transportation, and storage facilities in the United States and abroad to enable affiliates to keep pace with the growth of the airlines' passenger and cargo fleets. The first of the new jumbo jet aircraft will use Esso fuels in New York and key European cities late this year.

Humble revenues benefited from significant growth in sales of both natural gas and liquefied petroleum gas. Sales of natural gas, already at high levels, grew by 14 per cent, owing primarily to deliveries under long-term contracts made in previous years. Sales of natural gas plant liquids were up 18 per cent, mostly as a result of increased petrochemical feedstock sales. Over a three-year period and at a cost of $80 million, Humble built 13 new gas plants and expanded 14 existing ones in Texas and Louisiana to remove additional liquids from natural gas to supply this rapidly growing business.

Humble also broadened activities in two other forms of energy: coal and uranium.

In early 1969 a Humble subsidiary, The Carter Oil Company, which holds large bituminous coal reserves in Illinois and the Rocky Mountain area, signed a long-term sales contract with Commonwealth Edison Company of Chicago. The contract calls for delivery of about three million tons of coal annually. Work was begun to develop an underground mine at Carlinville, Illinois, to supply the coal to the utility company.

In evaluating its uranium holdings, Humble determined that a deposit in Live Oak County, Texas, contained more than five million pounds of recoverable uranium oxide, and a contract is being negotiated with a nonaffiliated company for the commercial development of this ore body.

Canada Imperial Oil Limited accelerated its program for the exploration and evaluation of its strong land position covering about 10 million acres in the Mackenzie River Delta of the Canadian Arctic, 300 miles to the east of the Alaska North Slope discovery. Three seismic parties are at work in the region, and the company is drilling one exploratory well on wholly owned acreage, while a second well is being drilled on acreage in which Imperial has a one-third interest. Imperial also continued to develop production in established oil fields in the Rainbow-Zama area of northern Alberta and to explore other areas of Canada, principally in the West.

Imperial, the leading oil marketer in Canada, continued to expand its petroleum product distribution facilities. An important part of its marketing program has been the installation of automotive service centers, which Imperial pioneered in Canada. At year-end 36 of these centers were in operation.

5. Jersey is among the nation's largest industrial corporations possessing enormous financial resources, conducting operations and making investments, world-wide. Included among its operations and investments are substantial investments in the production and sale of fertilizer products. It has grown significantly in recent years due in large measure to a policy of expending capital liberally and acquiring other firms.

5a. Jersey is a large industrial corporation with enormous financial resources, and world-wide operations and investments.

• • • •

5b. Jersey has grown significantly in recent years, due in large measure to a liberal policy of capital expenditure and the acquisition of other firms.

• • • •

5b(2). Jersey's capital expenditures, including amounts spent in searching for oil and gas reserves, have averaged more than $1 billion annually over the decade preceding 1963, and have been primarily responsible for the company's continuing growth. (GX 2).

• • • •

5d(4). Jersey Production Research Company is a wholly-owned subsidiary of Jersey which conducts research in connection with methods for determining and recovering mineral deposits, principally oil. Any non-petroleum mineral deposits which the company discovers are recorded and reported to Jersey. (Rathbone Tr. 839-41).

• • • •

5e(3). The Board Advisory Committee on Investments (BAC) provides assistance to Jersey and its affiliates in evaluating proposed investments, and also initiates studies of investment opportunities. The BAC reports directly to the Board of Directors and maintains contact with Jersey's various departments. (GX 113, Stip. of Fact No. 2, par. 1). The BAC

consists of the chief executives of practically all of Jersey's major staff groups. (Rathbone Tr. 846).

Ordinarily, a project would be presented to both the BAC and the Executive Committee, with the former being the more detailed review. However, an item budgeted at less than $5 million normally would not go to the Executive Committee. (Mangelsdorf Tr. 342-43).

PLAINTIFF'S MEMORANDUM ACCOMPANYING PLAINTIFF'S PROPOSED FINDINGS OF FACT AND CONCLUSIONS OF LAW

Simultaneously herewith the Plaintiff is filing its proposed findings of fact and conclusions of law which are fully supported by record references. Rather than repeat the factual detail set forth in the proposed findings or set forth again the many references to, and quotations from, the defendants' own documents as was done in Plaintiff's pretrial brief, this memorandum summarizes the plaintiff's factual contentions and relates them to the legislative purpose underlying Section 7 of the Clayton Act and to recent Supreme Court decisions.

Summary of the Case

Pending the outcome of this litigation, Jersey has been enjoined from consummating its contract to acquire PCA's assets. Consummation of the

contract was originally scheduled for October 21, 1964 and would have achieved Jersey's goal of producing and marketing potash. Jersey's interest in the potash business began in about 1960 when it first became interested in becoming a major fertilizer producer. This was consistent with its continuous desire to put its tremendous financial resources to work by making and selling profitable new products to both new markets and to existing markets in which it was then so successfully selling petroleum and related products.

Jersey's production of its by-product natural gas, from which ammonia is made, led it to manufacture anhydrous ammonia for fertilizer use. In turn, this led it into the manufacture and sale of a full line of fertilizers derived from phosphate and potash. Soon it had extensive fertilizer facilities in Central South America and in other foreign countries. In addition, it was actively exploring the possibilities of entry into the fertilizer business in the United States. To supply its huge actual and potential raw material requirements, it sought to develop and acquire potash and phosphate reserves. With this objective, through its Canadian subsidiary, Jersey had already spent between two and three million dollars and proposed to spend an additional one and one-half million dollars, to conduct the exploration and test drilling essential for the ultimate production of potash.

In a nutshell, the Government's case rests on its contention that because Jersey was so motivated to mine and market potash and because it had the resources to satisfy this desire, it would probably have entered into the production and marketing of potash in competition with PCA and

other United States potash producers by internal expansion or by other means had it not made a contract to acquire PCA. Accordingly, the acquisition, if not permanently enjoined, will eliminate Jersey as a potential competitor to PCA and the other United States potash producers. It will also immediately foreclose such other producers from the opportunity of supplying Jersey's subsidiaries with the enormous amounts of potash they require for their fertilizer manufacturing operations.

Argument

The Statutory Purpose of Section 7

H. Rep. 1191 (81st Congress, 1st Session) makes clear that the amendments to Section 7 of the Clayton Act were concerned with the broad problem of the high level of economic concentration in the American economy. Congress viewed with alarm the increasing power in the hands of the largest corporations and since the trend was found to be due in considerable part to the external expansion of business through mergers and acquisitions, principally by large corporations buying out small companies, Congress sought to stem the tide through the anti-merger provisions of the Clayton Act. Thus, the purpose of the 1950 amendments was "to limit future increases in the level of economic concentration resulting from corporate mergers and acquisitions." (S. Rep. 1775, 81st Congress, 2nd Session). Acquisitions beyond the reach of the Sherman Act were to be proscribed and Section 7 was intended to be an effective guard against "economically significant acquisitions."

Congress therefore, prohibited acquisitions where the effect may be substantially to lessen competition in any line of commerce in any section of the country. There was to be no requirement of actuality or certainty in the injury to competition because anticompetitive consequences were intended to be arrested in their incipiency before they developed.

The legislative history shows particular Congressional concern with acquisitions by large corporations and a broad plan of preserving a free enterprise system of decentralized, independent units. The Supreme Court has expressly recognized that in deciding the legality of a merger it must weigh heavily this economic way of life which Congress was trying to preserve and that mergers which offended it were to be blocked. Brown Shoe Co. v. United States, 370 U.S. 294, 333 (1962). Thus, the size of the acquiring company has uniformly been considered a most important and decisive factor in evaluating acquisitions.

The Supreme Court has applied this philosophy in a number of instances to strike down mergers and acquisitions involving large firms or where the competition which might eventually be lessened was solely potential in character. For instance, in United States v. Aluminum Company of America, 377 U.S. 271 (1964), the Supreme Court held that the acquisition of the Rome Cable Corp. by Alcoa violated Section 7 by eliminating actual competition between them in the sale of aluminum wire and cable. Already the leading producer in the field, acquisition by Alcoa of Rome would add but 1.3% to its market share. But "[P]reservation of Rome, rather than its absorption by one of the giants, will keep it 'as an important competitive

factor' . . ." the Court said (at p. 281). In United States v. El Paso Natural Gas Co., 376 U.S. 651 (1964), Pacific Northwest Gas Co. had been unsuccessful in efforts to sell natural gas in California, could not get the gas needed to set up a project and was unable to satisfy the regulatory agencies as to its ability, but yet the Supreme Court held that it was a substantial potential competitor because of its efforts and its interest in the business and the attractiveness of the market. The entry of new firms in a booming market demonstrated the opportunities which were in fact available. On this basis, the Court found the acquisition of Pacific Northwest by El Paso to be in violation of Section 7. Similarly, in United States v. Penn-Olin Chemical Co., (378 U.S. 158 (1964)), the Supreme Court noted that the relevant business was expanding and both Penn-salt and Olin Mathieson were strongly motivated to enter the market independently. Thus, the Court held that their formation of a joint venture to do so eliminated potential competition between them including the potential competition afforded by a firm which may have merely remained a threat to enter at some indefinite future time.

Thus, Section 7 proscribes acquisitions eliminating the threat of eventual competition as well as those eliminating a substantial factor in actual competition. This is particularly so, as indicated above, when the acquisition is being made by a very large corporation.

The Elimination of Potential Competition Between Jersey and PCA.

Here, Jersey, the largest industrial corporation in the world in terms of assets held, has a record of intensive interest and activity looking to the development of its own potash production and manifestly cogent motivation for doing so. The attractive profit opportunities in this growing field, its complementary relationship to fertilizer activities in which Jersey was already becoming an increasingly important world-wide factor, Jersey's need to carry a full line of fertilizer materials for marketing purposes and need for a raw material position to achieve participation in the most profitable part of the business, are all factors which will continue to move Jersey in this direction even if this acquisition is barred. Jersey's desire for captive potash to supply its fertilizer plants cannot justify its elimination by acquisition of one of the leading competitors it would otherwise face in the production and marketing of potash.

Jersey has the means and motive to enter the business of producing and selling potash on a substantial scale without acquiring a large potash producer. Under the cases, no more need be shown to bar this acquisition. But the fact is that Jersey was actively engaging in activities calculated to bring about an entry into the business through self-development. 1/

1/ The Government does not contend that Jersey's efforts to integrate or diversify are unlawful. On the contrary, such efforts increase competition and add to the national resources. But the Government is attacking the means selected by Jersey to grow, i.e. the elimination of the leading independent competitive factor.

The economics of the fertilizer industry were irrevocably drawing Jersey into a potash producing position. This is clearly demonstrated by the company's own documents. Once in the fertilizer business Jersey soon learned it could maximize fertilizer profits by producing potash instead of buying it. It learned that carrying a full line was most desirable from a competitive marketing viewpoint. It found that the potash industry offered great growth possibilities and that potash was a product with vast sales potential which was in no danger of competition from other products. Jersey examined potash sources which could supply its own requirements and took out permits in the area of the richest known potash beds in the world. It pursued a detailed solution mining experiment and conducted an extensive number of studies, surveys of competition and market analyses. Solution mining was, however, temporarily shelved, in part to permit evaluation of the results of solution mining by others but mostly because a larger sized conventional mine would make possible greater profits. But since large scale production could be more easily sold if Jersey had a partner to share the burden, Jersey found acquisition of PCA to have benefits over and above those which would be secured after taking the trouble to develop its own business. Moreover, Jersey found that it would require a delay of four to five years before it could begin producing on its own and by that time it have have to face the competition of several other new entrants as well as the competition of the few established suppliers presently in the business. Acquisition of PCA nicely eliminated this delay and gave Jersey a jump on the other potential producers, and gave it an experienced sales organization and a

market over and above its own growing needs for potash. Use of its checkbook instead of hard, honest work in the market place was a simple way for Jersey to obtain a commanding position in potash overnight.

Jersey was so motivated to become a potash producer that it would have used its checkbook to continue its self-development program, but for the agreement with PCA. It is not necessary to speculate where or exactly when it would have achieved its goal. It had several permits in the Canadian potash fields and may have found it feasible on further exploration to construct a conventional mine or at least revert to the solution mining technique which is now in use by Kalium Chemicals to mine potash in Canada. Two of Jersey's permits were readily adaptable to this method of extraction.

In short, Jersey now seeks to justify its entry into the potash business by acquisition instead of by self-development because the economics are more attractive, marketing problems are dissolved and it can thereby secure a position immediately. The Supreme Court has expressly held that such business reasons do not authorize an acquisition otherwise unlawful. 2/ Indeed, if such reasons permit a firm like Jersey, with all its vast resources, ingenuity, experience and capabilities, to take the easy road then Section 7 can really do nothing to stop the elimination of independent firms from our economy and the concentration of economic power in the hands of the few. Section 7 clearly was intended by Congress, and has been so construed by the Supreme Court, to forbid by acquisition and merger the elimination of competition which would otherwise probably have existed, such as that between

---

2/ United States v. Philadelphia National Bank et al, 374 U.S. 321, 370-371 (1963).

Jersey and PCA.

Vertical Foreclosure Resulting from the Acquisition, If Consummated.

This acquisition also violates Section 7 in that it deprives rivals of PCA from the opportunity of supplying the substantial market represented by the potash needs of Jersey's fertilizer plants. The primary vice of a vertical merger or other arrangement tying a customer to a supplier is that by foreclosing the competitors of either party from a segment of the market otherwise open to them, the arrangement may act as a clog on competition which deprives rivals of a fair opportunity to compete. (Brown Shoe Co. v. United States, supra, at 324). Relying upon the testimony of Brown's President that Brown intended to supply shoes to Kinney, the Court found the results of the acquisition of Kinney by Brown to be analogous to a tying clause and observed that "such an arrangement is inherently anticompetitive" and "can rarely be harmonized with the strictures of the antitrust laws." Thus, the Court said, competition may be substantially lessened "although only a relatively small amount of commerce is affected."

In Brown Shoe the market represented by Kinney's shoe purchases aggregated 1.2% of national shoe sales and the foreclosure at the time of the trial of the action was one-tenth of one percent of the market but the Court passed over this fact with perfunctory consideration and held that since Brown was one of the leading manufacturers of shoes and Kinney, the largest independent chain of family shoe stores, no merger between a producer and independent retailer in the shoe industry could involve a larger potential

market foreclosure. In International Salt Co. v. United States, 332 U.S. 392 (1947), the volume of sales foreclosed by the tie-in clause totalled only about $500,000 and the arrangement was held illegal because this amount of commerce was not insubstantial. Other cases under Section 7 where the vertical foreclosure from an acquisition or merger involved relatively small amounts of commerce but were held to violate the Clayton Act were, for example, United States v. du Pont de Nemours, 353 U.S. 586 (1957), in which du Pont's sales to General Motors comprised but 1.6% of the total market for the type of fabric used by the automobile industry. Because General Motors accounted for almost half of the auto industry's sales its requirements for automotive fabrics must have been substantial, the Court said, and since du Pont was GM's largest supplier, du Pont's ownership of 23% of GM stock resulted in a substantial lessening of competition. In United States v. Bethlehem Steel Corp. et al.,(168 F. Supp. 576 (S.D.N.Y. 1958)), the Court held that Youngstown, a purchaser of wire rope, would probably become a captive market for Bethlehem. In holding that the market represented by Youngstown was substantial and its acquisition by Bethlehem would substantially lessen competition, the Court noted that the foreclosure would involve 1.3% of the entire market or 2,585 tons.

In the instant case, PCA is the leading producer of potash in the United States and the second largest in North America. Although other firms have indicated that they propose to become producers (by 1970 or thereabouts), there are but nine companies presently operating mines in the United States and PCA makes 17% of the total potash deliveries in this country. Jersey,

whose contemporaneous documents reflect the intention of obtaining a captive source of supply and whose Board Chairman (as well as the President of the Jersey subsidiary responsible for obtaining potash for Jersey's fertilizer operations) testified that Jersey fully planned to use PCA after the acquisition as a captive supply source, is a substantial purchaser of potash with requirements in excess of those of the largest customers of PCA or Southwest Potash and greater than the production capacity of three of the nine producers. Thus, like Brown Shoe and du Pont, there really could be no vertical foreclosure in this industry of more significance than Jersey's contemplated acquisition of PCA.

To the extent removal of Jersey as an available customer, as a result of acquiring PCA, forecloses suppliers of shipments from United States mines other than PCA, there is a foreclosure of competition in the production and sale of potash in this country.

Nature of the Evidence

The evidence of Jersey's potential competition, its substantial position and its large purchases of potash are contained primarily in documents obtained from the defendants and offered into evidence by the plaintiff. The defendants have stipulated that these documents are authentic and genuine. Those documents which were preserved in the defendants' files were, almost without exception, prepared concurrently with the events they purport to portray, and reflect the intent, acts and policies of the Jersey complex. The inferences fairly drawn from such material have far more reliability than self-serving declarations and reflective testimony which are intended to try to explain

away the history of the past several years. Such is the character of the evidence principally relied upon by the defendants and even that fails in its purpose. For its principal witnesses, the Chairman of Jersey's Board of Directors and the Chairman of the Esso Chemical subsidiary, both testified that Jersey would continue to look for sources of potash to develop if the acquisition of PCA is blocked by this Court and both stated under oath that PCA was to become a captive source of supply thus precluding other suppliers from participating in the market represented by Jersey's purchases. Thus, their testimony in effect corroborates the inferences flowing from the documentary evidence which plaintiff contends demonstrates that the acquisition of PCA by Jersey would result in a violation of the law.

The weight to be accorded documentary evidence of a contemporaneous nature compared to trial exculpations has been noted by the Supreme Court. For example, in United States v. U. S. Gypsum Co., 333 U.S. 364, 396 (1948), a Sherman Act case, the Supreme Court indicated that in the face of contemporaneous documents establishing a prima facie case testimony at trial conflicting with the inferences to be drawn therefrom is entitled to little consideration. In United States v. Penn-Olin, supra, the Supreme Court again rejected subjective evidence by corporate officials of the defendants disclaiming their potential competitiveness. The Court relied instead on the probabilities suggested by the objective evidence.

CONCLUSION

The Government submits that the acquisition of PCA by Jersey would violate Section 7 of the Clayton Act, as amended.

Respectfully,

FRED D. TURNAGE

NICOLAUS BRUNS, JR.

UNITED STATES DISTRICT COURT

NORTHERN DISTRICT OF ILLINOIS

EASTERN DIVISION

- X

UNITED STATES OF AMERICA, :

Plaintiff, : Civil No. 67 C 1621

-against- : FINAL JUDGMENT

PEABODY COAL COMPANY, et al., :

Defendants. :

- X

Plaintiff, United States of America, having filed its complaint herein on Sept. 21, 1967, and plaintiff and defendants, by their respective attorneys, having consented to the entry of this Final Judgment without trial or adjudication of any issue of fact or law herein, and without this Final Judgment constituting any evidence or admission by either party hereto with respect to any such issue;

Now, therefore, without any testimony having been taken, without trial or adjudication of or finding on any issue of fact or law, and on consent of the parties hereto, it is hereby

Ordered, adjudged and decreed:

I.

This Court has jurisdiction of the subject matter of this action and of the parties hereto. The complaint states claims upon which relief may be granted under Section 7 of the Clayton Act, 15 U.S.C. § 18.

II.

As used in this Final Judgment:

A. "Peabody" means the defendant Peabody Coal Company, an Illinois corporation, and any other person owned or controlled by defendant Peabody or owned or controlled by any person owning 50% or more of the voting stock of defendant Peabody;

B. "Stock" means capital stock and any other share capital;

C. "Person" means any individual, partnership, corporation, association or other business or legal entity;

D. "Eastern Interior Coal Province" means the bituminous coal field which underlies approximately 67% of the State of Illinois and a substantial portion of southwestern Indiana and western Kentucky;

E. "Eastern Interior Coal Province Sales Area" means the area of the State of Illinois, western Indiana, western Kentucky, western Tennessee, eastern Missouri, eastern Iowa, southwestern and central Wisconsin, and southeastern Minnesota;

F. "Operating Coal Company" means any person operating one or more bituminous coal mines, or selling any bituminous coal, in the eastern interior coal province sales area;

G. "Coal Reserves" means fee ownership of, or leasehold interest in, or rights to mine under royalty arrangements, or options or contracts to acquire, strip or underground bituminous coal reserves located in the eastern interior coal province sales area.

III.

The provisions of this Final Judgment applicable to any defendant shall also be applicable to each of its officers, directors, agents, and employees and to each of its subsidiaries, successors and assigns, and to all other persons in active concert or participation with any of them who receive actual notice of this Final Judgment by personal service or otherwise.

IV.

A. After two years from the date of entry of this Final Judgment, defendant Peabody is enjoined and restrained from having as an officer or director any person who is at the same time an officer or director of Southwestern Illinois Coal Corporation, an Indiana corporation.

B. Defendant Peabody is enjoined and restrained from having as an officer or director any person who is at the same time an officer or director of any other operating coal company. This provision shall not apply to separately organized joint ventures to which defendant Peabody is a party.

V.

Defendant Peabody is enjoined and restrained for a period of ten years from acquiring, except upon prior approval of the plaintiff, (a) any part of the stock of, or any financial or managerial interest in, any operating coal company, or (b) any coal mine located in the eastern interior coal province sales area.

VI.

Defendant Peabody is hereby enjoined and restrained for a period of five years from the date of entry of this Final Judgment from acquiring in any year commencing on said date or the first four anniversaries thereof, more than five million tons of coal reserves from any other operating coal company or companies except upon prior approval of the plaintiff. The swapping or exchange of coal reserves for coal reserves, without any other payment or consideration, shall be disregarded for purposes of this provision.

VII.

A. Defendant Peabody is ordered and directed, within six months after the entry of this Final Judgment, to organize a separate, viable operating coal business (with adequate strip and/or underground coal mine or mines and coal reserves in the eastern interior coal province, mining and processing machinery and equipment and all facilities used in connection therewith, and managerial, supervisory, technical and other personnel and customer accounts) either as a subsidiary corporation or as a separate division of defendant Peabody, and defendant Peabody is further ordered and directed within two years after the date of entry of this Final Judgment to divest itself, absolutely and in good faith, of said coal business and any financial or managerial interest therein, by one of the following methods:

a. Sale thereof as a viable operating business to a purchaser or purchasers approved by the plaintiff, or

b. Sale of all of the stock thereof by one or more sales to the public through an underwriter or underwriters.

B. The operating coal business required to be established and divested by defendant Peabody under Paragraph A hereof shall, at the time of such divestiture, actually be engaged in the production and sale of bituminous coal at the rate of not less than six million tons per annum, and shall have sufficient assets and earning power, and shall have or shall reasonably be expected to be able to obtain sufficient coal reserves for continued production and sale of bituminous coal at said rate of not less than six million tons per year for twenty years.

C. Plaintiff, prior to the final divestiture of said coal business as provided for in the foregoing Paragraph A, shall have opportunity to approve or disapprove of the assets thereof and, in the event of disagreement with defendant Peabody with respect thereto, plaintiff may petition the Court to determine the matter and enter such order as the Court may deem appropriate to insure fulfillment of the above requirements.

VIII.

A. Defendant Peabody shall make known the availability of said coal business for sale by ordinary and usual means for a sale of a business. Defendant Peabody shall furnish bona fide prospective purchasers all necessary information, including pro forma statements, regarding the same and the operation thereof and shall permit them to make such inspections as may be necessary for the above purpose.

B. Defendant Peabody shall not acquire any long-term debt obligation or stock of, or any equity interest in, the purchaser or purchasers of said coal business except on such terms as may be approved by the plaintiff.

C. At the election of the purchaser or purchasers and with the prior approval of the plaintiff, defendant Peabody may lease, rather than sell or transfer absolutely, the coal reserves to be included in the assets of said coal business.

D. Without the prior approval of the plaintiff, none of the stock of said coal business shall knowingly be disposed of to any person who is an officer, director or executive employee of defendant Peabody, any person in which defendant Peabody owns any material amount of stock or other material financial interest or any person beneficially owning or having unrestricted discretionary power to vote common stock of Peabody in excess of two percent of the shares outstanding, except for an institutional investor acting on behalf of its own members, depositors or shareholders or an underwriter or dealer acting as such.

IX.

For the purpose of determining or securing compliance with this Final Judgment and subject to any legally recognized privilege, duly authorized representatives of the Department of Justice shall, upon written request of the Attorney General or the Assistant Attorney General in charge of the Antitrust Division, and on reasonable notice to defendant Peabody made to its principal office, be permitted (1) reasonable access during the office hours of Peabody to all books, ledgers, accounts, correspondence, memoranda and other records and documents in the possession, custody and control of defendant Peabody relating to any of the matters contained in this Final Judgment, and (2) subject to the

reasonable convenience of defendant Peabody, but without restraint or interference from it, to interview officers, directors, agents or employees of defendant Peabody, who may have counsel present, regarding any such matters; and, upon such request, defendant Peabody shall submit such reports in writing to the Department of Justice with respect to the matters contained in this Final Judgment as may from time to time be requested. No information obtained by the means provided in this Section IX shall be divulged by any representative of the Department of Justice to any person other than a duly authorized representative of the Executive Branch of plaintiff, except in the course of legal proceedings in which the Department of Justice is a party for the purpose of determining or securing compliance with this Final Judgment, or as otherwise required by law.

X.

Jurisdiction of this cause is retained by this Court for the purpose of enabling any party to this Final Judgment to apply to this Court at any time for such further orders and directions as may be necessary or appropriate for the modification, termination, construction or carrying out of the provisions of this Final Judgment and for the enforcement of compliance therewith and punishment of violation thereof.

United States District Judge

October 23 1967

INTERFUEL COMPETITION AND CHANGES IN THE COAL INDUSTRY SINCE WORLD WAR II

Report and Statistics by Dr. Bruce C. Netschert

Defendants' Exhibit 85
U.S. v. General Dynamics, et al.

Report

INTERFUEL COMPETITION AND CHANGES IN THE COAL INDUSTRY SINCE WORLD WAR II

by: Dr. Bruce C. Netschert

I. INTERFUEL COMPETITION

A. In the period since World War II coal has been a decreasingly effective competitor in the following markets: railroads, home and building heating, and industrial users of fuel for heat and electricity generation. The railroad market has completely disappeared; the space heating market has declined by 80% or more; and the industrial market, although suffering a lesser decline in absolute terms, has failed to keep pace with the growth of industry. The utility market, as a consequence, is now the mainstay of coal production. These changes, in terms of the markets for all energy, are not new but are a continuation of trends that have continued throughout much of the present century.

This is demonstrated by the attached tables, which show the declines referred to and the net result: a diminished position of coal in the overall energy resource consumption pattern.

B. These national trends and patterns are paralleled in the Midwest. The utility market is predominant, but in this as well as all other markets there is strong competition from the other fuels. Gas and oil, the traditional competitors, have now been joined by nuclear fuel, which will constitute an evermore serious competitor in the coming decade. Other new competitors are pumped storage, and geothermal energy as a source for power generation.

Coal also faces competition from the other fossil fuels in the market for use by industrial and institutional consumers in heating and

self-generation of electricity. Through the technique of "total energy" or on-site generation gas is definitely a competitor and oil may be. Total energy is growing rapidly and constitutes a competitive threat to coal both directly and indirectly (through the elimination of the consumption of power generated by coal-fired central stations).

In sum, the competitive situation within the energy markets as a whole is already more fluid than it has ever been before and will become still more fluid in the future.

The foregoing is demonstrated by the attached tables.

C. Enacted or pending air pollution abatement controls will have an adverse impact on coal during the next 10-20 years due to their effect on interfuel competition and consumption patterns of coal. This stems from (a) the inability to remove inorganic sulfur from coal economically, (b) the added cost of any desulfurization, (c) the added cost of stack gas desulfurization, (d) the added cost of particulate control, (e) the relative shortage, hence higher value of low sulfur coal, and (f) the inevitable increasing stringency of air pollution regulation over the coming decades.

This will be supported by the general knowledge of the witness and reference to the testimony of other witnesses.

D. In sum, competition among coal producers cannot be considered except within the context of interfuel competition.

II. STRUCTURAL CHANGES IN THE POST-WORLD WAR II PERIOD

A. Since World War II, the following changes in the production and marketing of coal have occurred.

1. In the patterns of coal consumption and marketing

a. Coal has lost its railroad market and has seen its retail market severely curtailed.

b. The industrial market for coal has failed to keep pace with industrial growth.

c. The utility market has grown uninterruptedly and has, as a consequence, come to be the dominant coal use.

d. As a result of the above changes and of changes in the scale and technology of power generation, the major emphasis in coal marketing has increasingly emphasized large quantity, long-term contracts, and Btu content, chemical and physical characteristics.

2. In labor costs

a. As a result of aggressive union bargaining, wage costs and fringe benefits have increased markedly.

3. In mining technology

a. To offset the increased labor costs, there has been a virtual technological revolution in mining

technology, with the introduction of wholly new techniques, significant improvement in old techniques, and a substantial increase in scale.

4. In productivity

a. The effect of the technological changes has been to increase productivity (as measured in output per man-day) sufficiently to enable the average F. O. B. mine value of coal to be kept competitive and relatively stable in the face of the general inflation in wholesale prices.

5. In coal preparation procedures

a. The emphasis on Btu content and on uniform characteristics in the delivered coal due to the changes in electric utility technology and buying practices has led to both more coal preparation and more intensive preparation so as to be able to deliver a high and uniform quality product.

6. In transportation costs

a. The increased competitive pressure on coal in the utility market has led to increased pressure on the railroads to offer lower rates.

b. The increased competitive pressure on coal has also generated a major technological innovation in

---railroad transportation, namely, the unit train, which has permitted lower rates.

The foregoing is demonstrated in the attached tables.

B. The effect of the changes listed in (A) above has been to enhance the economies of scale in coal production. Indeed, the producers were forced to turn to these economies in order to remain effective competitors in the energy scene.

C. The increased scale required has, in turn, led to greatly increased capital requirements in the industry. "Mechanization" has involved the substitution of capital for labor but, as machines have become larger and mine capacity has also become larger, there have been economies in the capital requirements.

D. All of the foregoing has led to an increase in the size of mines. This is illustrated in the attached tables.

E. In the past six years, oil companies have acquired significant coal production capability through the acquisition of large coal companies. In addition, several other oil companies have acquired large holdings of coal lands and one of these companies is in the process of establishing coal production in the Midwest. This is indicated in the attached table.

The significance of these moves is that the oil industry has established itself as a major element in coal production, linking, in many instances, under common ownership, energy resources of coal, oil, gas, uranium, oil shale and tar sands.

6 Coverage includes bituminous, sub-bituminous and lignite, as in Bureau of Mines statistics.

1/ Includes oven and beehive coke plants.

2/ Includes steel and rolling mills and other manufacturing and mining industries.

U.S. COAL CONSUMPTION, TONNAGE AND PERCENTAGE DISTRIBUTION
BY CONSUMER CLASS, 1947-1967 (CONTINUED)

3/ Includes bunker, lake vessel, and foreign, plus retail deliveries to other consumers.
4/ Approximates total consumption.
5/ Data collection discontinued.

FOR IMMEDIATE RELEASE

NOTE TO EDITORS AND CORRESPONDENTS:

Following is a brief status report on the U. S. civilian nuclear power program:

Status of nuclear power plants, as of March 31, 1969

	Kilowatts
13 in operation	2,828,700
46 under construction	35,114,400
32 planned (reactors ordered)	27,902,300
9 planned (reactors not ordered)	8,255,000
Total	74,100,400

During the first quarter of this year there were no announcements by electric utilities of plans to build nuclear power plants or on selection of suppliers for plants previously announced.

During the first quarter of 1968, utilities made known plans for 11 nuclear power plants with a total capacity of 9,680,000 kilowatts. Reactor suppliers have been selected for 8 of these plants.

Attached for your information is a map of the United States showing the location of all present and proposed civilian nuclear power plants for which reactor suppliers have been selected.

TABLE XXVIII
OIL COMPANIES WITH COAL INTERESTS

PART A: OIL COMPANIES WITH COAL SUBSIDIARIES

Oil Company	Coal Subsidiary	Year of Acquisition of Entry	1968 Coal Production (tons)	Per Cent of Total U.S. Coal Production in 1968
(1)	(2)	(3)	(4)	(5)
Gulf Oil Co.	Pittsburg and Midway Coal Mining Co.	1964	9,249,500	1.70%
Continental Oil Co.	Consolidation Coal Co.	1966	59,884,621	10.99
Occidental Petroleum Corp.	Island Creek Coal Co.	1968	32,926,752 1/	6.04
Standard Oil Co. of New Jersey	Monterey Coal Co.	1968	2/	-
Standard Oil Co. of Ohio	Old Ben Coal Co.	1968	9,923,107	1.82
Kerr-McGee Corp.	Kerr-McGee Corp.	1969	3/	-
North American Resources Corp.	Thompson Creek Coal & Coke Corp.	1969	4/	-

PART B: ADDITIONAL OIL COMPANIES WITH COAL HOLDINGS NOT SHOWN IN PART A

Oil Company	Location of Holdings
(1)	(2)
Atlantic Richfield Co.	Colorado
Sinclair Oil Corp.	West of the Mississippi River
Shell Oil Co.	Montana
Sun Oil Co.	Wyoming

TABLE XXVIII
OIL COMPANIES WITH COAL INTERESTS (CONTINUED)

* Coverage includes bituminous, sub-bituminous and lignite, as in Bureau of Mines statistics.

1/ Includes 7,011,000 tons of Maust Coal Corp., acquired by Island Creek in 1969.
2/ Initial production announced for the fall of 1970.
3/ Initial production undertaken in early 1969.
4/ No production since 1966, but company is reported to be investigating potential markets for subsidiary's reserves.
